The fluid preparations of ergot, digitalis and strophanthus deteriorate more or less rapidly under ordinary conditions. The principal causes of such deterioration are oxygen of the air and heat, therefore recently manufacturers have taken advantage of ampuls and are putting up preparations of the above substances in ampul form. It is a known fact that fluidextract of ergot retains its activity for a much longer period of time when kept in well-filled and tightly-stoppered containers, which precautions can be had through the use of ampuls.

Ampuls are always ready for immediate use. It is no longer necessary, as in making up solutions from powder or tablet, to wait until the water can be sterilized and cooled. The solution is accurately adjusted to contain a specific amount of medicament in each cubic centimeter, thus insuring accuracy of dose.

The solution is asepticised by heat or by filtration through porcelain, as its nature demands. The drug is treated with the most suitable solvent, whether that be olive oil, distilled water, or physiological salt solution.

Permanence is attained by means of the hermetically sealed container which protects the contents from bacterial contamination and from oxidation, while actinic effect of light is prevented by the use of amber ampuls and by enclosing the glass ampuls in an impervious cardboard carton.

In hospitals, the preparation and preservation of solutions is a matter of little difficulty but to the busy general practitioner it is a source of annoyance and inconvenience and to say the least, is in many cases decidedly unsatisfactory; hence, the advantage of using ampuls.

Especially during war time, a great deal of ready medicine must be at hand, both on the battlefield and in the hospitals. It is true that many tablets and

powders are always ready at hand, but how much more convenient and time-saving would the ready ampul be.

It is absolutely necessary that only distilled water be used, as ordinary tap water, on account of the presence of bacteria and foreign matter, is objectionable. Few physicians have distilled water constantly on hand in their offices, and especially in time of war, the possibility of securing distilled water in a non-contaminated room, on the battlefield, is hopeless and to procure the necessary amount from the usual sources of supply, at times of peace and more so during times of war, is time-consuming and otherwise inconvenient, hence the advantage of using prepared ampuls.

It is manifestly all important that solutions for hypodermic injection should be sterile. It is likewise evident that physicians are very frequently unable to prepare sterile solutions extemporaneously, especially on the battlefield during times of war and therefore by using ampuls, all of these difficulties can be overcome.

---

### THE POSSIBILITIES INHERENT IN A COLLEGE OF PHARMACY FOR RENDERING THE MAXIMUM OF EFFICIENT SERVICE TO PHARMACY.\*

---

FREDERICK J. WULLING.

---

I am to speak upon the future possibilities inherent in the St. Louis College of Pharmacy. The possibilities of this college are the same in kind, as those of any other. The fundamental purpose of any high-grade college is, or should be, to render the maximum of efficient service to the calling and through the latter to the public. To render the most efficient services a college must meet many requirements and must conform to some quite definite standards. Some thoughts that have come to my mind in the matter I have formulated into an outline which I submit herewith and which I will use as the basis of some remarks:

*Composition of the college.*—1. Governing body, 2. faculty, 3. quarters, 4. equipment, 5. students, 6. alumni. All of these are organized to render the maximum of efficient service to (a) the student body, (b) the profession, and through these to (c) the public.

Under the heading of governing body comes the consideration of business administration, which includes executive faculty officers; budget; clerical assistance; card indices; statistics; co-operation with faculty; appointments; salaries and salary scale; faculty promotion; research; fellowships; scholarships; publications; future development and extension work.

Under the heading of faculty comes the consideration of organization, which includes executive faculty; executive officers; classification of teachers into dean, professors, assistant professors, instructors and assistants; conferences; aca-

---

\* An address delivered at the fiftieth anniversary of the St. Louis College of Pharmacy.

demic freedom; sabbatical year; administration of educational matter; relation to governing body; relation to students; ratio of teachers to number of students; relations with other faculties; co-operation; promotion; salaries; research; fellowships; scholarships and extension work.

Quarters should be well-located; abundantly lighted, naturally and artificially; spacious; modern; sanitary; fireproof; well-adapted, and preferably a separate building.

Equipment should be, sufficient in quantity; adequate in kind and variety; up to date; extensively used; systematically kept, and inventoried.

Under the heading of students comes a consideration of the kind to attract; entrance standards; courses of study both undergraduate and graduate; rating of work in "credit hours"; conduct and discipline; honor system; employment while at college; organization; health conditions; moral standards; graduation standards; and degrees.

The alumni owe it to the college to keep in touch with it; send qualified students; advise in conduct of college; and uphold college ideals by precept and practice.

#### GOVERNING BODY

I will consider the first two divisions, governing body and faculty together.

Any college of pharmacy to be successful in the rendition of a maximum of efficient service must have a general aim and ideal, and a policy and a suitable and well-constituted organization to carry them out. This organization must include the governing body and the faculty. The respective functions of these two divisions within the organization should be designated, by conference and agreement, as clearly and definitely as possible, although in many respects the line can not be drawn very closely. In a general way, the governing body (the regents of universities and the dean, or the trustees of other educational bodies or associations and the dean) is usually and logically the dominating division, and has in charge the financial administration and, with the aid of the faculty, determines both the business and the educational policy of the institution. In the case of weak institutions the cause of the weakness can usually be found in the governing body, which, through indifference or incompetence or failure to fully recognize its duties and responsibilities on the one hand, or through unfavorable or uncontrollable conditions on the other, is unable to provide and maintain adequate quarters and equipment and a competent faculty for the fullest exercise of the purpose for which an educational institution is supposed to be created. In some few cases it appears that the governing body and the faculty are made up in whole or part of the same persons.

The second division of the organization is made up of the faculty. Where there is a weak governing body the weakness usually extends into the faculty and into all other divisions, while correspondingly a strong and well-qualified governing body establishes and infuses strength into all divisions. In some cases a strong faculty or a strong executive officer of the faculty succeeds through affirmative influence upon the governing body, in developing the college into a tolerably efficient working unit. These cases are not so rare as would generally be supposed. Indeed, in numerous cases, it is a single individual, usually clothed with some authority,

who sets the pace and formulates the ideals to be reached, and by patient endeavor and hard work corrects or overcomes the weakness or indifference of the governing body. A strong governing body will concern itself with the establishment of a sound financial basis for all divisions, resting upon a sufficient and equitably distributed budget to provide and maintain a representative faculty, adequate quarters and a well-selected and balanced equipment. An organization thus composed should divide the responsibilities of its functions into (a) a business administration, and (b) an educational administration; the governing body assuming the former and the faculty the latter.

#### BUSINESS ADMINISTRATION

The business administration, of course, is relatively important in that it must provide the funds for the conduct of the institution, and because the nature of the conduct depends upon the quantity of finances. There are practically only two classes of pharmaceutical teaching institutions in this country, and their division is based largely upon the sources of their finances. These sources are, on the one hand, primarily the student-bodies; on the other hand, the student-bodies and the States. In the former case there is often required a very careful and economical business administration, and because of the insistence of some of the teaching departments, as over against the claims of others the division of the finances is not always equitable unless the practice is followed of considering the needs of each department in the light of the needs of all departments and crystallizing the agreements into the form of annual or biennial budgets. In this part of the administrative work the faculty should render much assistance. Indeed, the organization should provide that the dean and the heads of faculty departments agree upon the distribution of the sums available for the educational administration and then submit their recommendations to the governing body.

Aside from the administration of the financial affairs, the business administration should provide for a sufficient clerical force, whose duty among others it should be to keep a complete set of books and from which should be compiled annually much information in the nature of statistics, which should be card-indexed for ready reference. This business record should include information as to receipts and disbursements, as to moneys paid for salaries, for supplies and for office staff, an index of the supplies, including their cost, etc., acquired annually under the respective budget divisions, etc. There are firms who make it a business to systematize other businesses. They do this often at a very low price, and money thus expended usually bears much fruit.

#### EDUCATIONAL ADMINISTRATION

Next in importance to or possibly co-equal in importance with or even superior to the business administration is the educational administration. This educational administration should be vested exclusively in the faculty, the latter, of course, subject to the governing body. A representative faculty is one composed of members who possess a high degree of attainment not only in their chosen fields of work, but also in the more academic fields of scholarship and in culture. It is imperative that they possess as the first essential pronounced abilities to teach. They should have a special pedagogical training and should be versed in

psychology and logic and philosophy. They should have a pronounced love for their work and should carry it on with enthusiasm and be able to communicate their enthusiasm to their students. They should be men of representative personality and of some affairs, and should be able to measure themselves satisfactorily with the successful teachers in other professional callings. The men in the higher ranks should possess not only the ability, but should also have the necessary incentive and time to carry on research work. The academic freedom which has so greatly contributed to the development of educational institutions in this and other countries should be enjoyed more fully by members of pharmaceutical faculties. They should also enjoy the advantages of the sabbatical year. It would redound greatly to the benefit of the college if it were an established rule that the men in any of the professional ranks be given the opportunity of a year's work and study in a foreign country, or even in some of the higher institutions of our own country at intervals of seven years. Where the sabbatical year is recognized the professor is usually away on leave of absence for either a full year at half salary or a half year at full salary.

#### THE FACULTY

The faculty should be composed of an executive faculty, accountable to the general faculty; an executive officer, who usually is and should be the dean; professors, associate professors, assistant professors, instructors, and assistants. The faculty should formulate all educational policies as well as establish the courses of study, the entrance and graduation requirements, the method of interpreting the work of students in credit units, the rules for the conduct and discipline of the students—in short, should administer upon all the educational activities of the college and be responsible only to the governing body. All faculty actions should be final only after approval by the governing body unless the latter has given the faculty power to act in either a general or special field.

#### CO-OPERATION OF FACULTY AND GOVERNING BODY

The governing body and the faculty should co-operate in the selection and appointment and in the promotion of faculty members, always with the fact in mind that it usually is not an easy task to find the right man at the low salaries offered, and that on this account great care in the selection of permanent additions to faculties should be exercised, lest insufficiently competent men lower the faculty standard. It would be a good plan to more universally adopt the practice of some colleges of appointing instructors from year to year and assistant professors and associate professors for periods of three years. This arrangement relieves both parties of embarrassment and the obligations are understood on both sides. Appointments of full professors are usually for an indefinite period, the unexpressed understanding being that the teacher who has reached the full professorial estate has also acquired the qualification to continue his work satisfactorily.

Many governing bodies have erred greatly in the past by bestowing academic titles on teachers wholly unqualified for such distinction. Indeed, there are numerous cases in which, instead of any salary or a sufficient salary, services were rewarded by titles which were often but not usually deserved. In this way pharmacy has been greatly abused, especially the title of professor.

The two divisions should further co-operate in establishing fellowships to foster research and in creating other opportunities for research; in providing scholarships for worthy and capable students; in promoting a continuous and developmental growth, including possibly extension work, and in other matters, such as a proper ratio of teachers to students; faculty salary scales; social work among students, including a study of their health conditions, environment, associations, entertainments, moral and social standards and suggestions for the improvement of these; rules of student conduct and discipline; student publications; honor system; relation of the college to other colleges and to organizations; college publications; maintaining the interest of the alumni in the college and securing their help and advice in the conduct of the college, etc.

The faculty should have frequent conferences, in which the members should harmonize and co-ordinate the work of the curriculum, each with the full and intimate knowledge of every other members' work and responsibility, to the end that each can give the fullest measure of effective service to the students and to the college. The work of a faculty is distinctly inferior where each member carries on his work independently and without regard to the work of the other members except in a very general way. It is the duty of the dean to see that the divisions and units or departments of a college co-operate and co-ordinate in all respects, even in the less important details, and that every member of the faculty is concerned at least as much in the welfare and success of the college as a whole as those of his own particular department. Over-development of some departments as against others should be avoided because it disturbs that balance in the nature and conduct of work which should characterize the efficient and high grade college. I do not hesitate to say that in the average faculty there is not enough co-operation and coherency to insure a maximum of efficient service.

For the most effective service the faculty should be a separate organization and should work as a unit. To facilitate its administration work, much of the work should be apportioned to appropriate committees; the heads of departments should constitute the executive faculty and the dean the administrative officer whose powers should be defined largely by the governing body. Individual effort and growth should be stimulated and recognized, especially in the lower ranks of the faculty. No two persons possess identical ability or capacity, but in the absence of special agreement the entire effort and ability of every full-time member, whatever it may be, quantitatively and qualitatively, should be contributed to the college. Every faculty member is doing his duty to the college if he contributes conscientiously the entire product of his activity, irrespective of quantity or quality (though these must, of course, measure up to a certain minimum), to the common cause and purpose of the college. Team work is the only kind of work faculties should do, and team work is the concerted work of a number centralized into one common purpose to produce that degree of efficient service which only earnest and willing working together will bring and which is the only kind of service any faculty should deem itself worthy of giving.

#### FACULTY AND STUDENTS

The faculty and the students should always co-operate to produce the best results for each. Much of the advice given to students is also applicable in a

degree to the faculty. The presumption is that the members of faculties always have in mind the fact that they also are students, but of a maturer growth, and in this light the faculty has duties to itself as well as to the student body.

The most important and far-reaching duty which the faculty owes extends, of course, to the student body. The students soon become the responsible practitioners. They carry with them the fullness or the paucity of ideas and ideals instilled into them during their student days; as the faculty so the students, in a large measure. While I would not belittle the importance of a well-rounded and conscientiously taught course of study, I yet would subordinate it to the imparting to students of high aims and lofty ideals in human conduct; to the students' development of a high sense of moral responsibility; to the creation within the students' hearts of an enduring love and enthusiasm and respect for their chosen calling; to the students' recognition that capacity for self-help and the continuous and capable exercise of that capacity and the effective use of specialized knowledge is far more necessary and resultful than the acquisition of much mere information subject to neglect and loss by the memory; to the students' conviction that the exercise of the reason, the use of sound and well-considered judgment, the practice of logic and the habits of order, sequence and accuracy are the essentials for personal and professional development, and that their opposites in an equal or even greater degree retard growth and usefulness and therefore impair quality of service. Students should be imbued with the fact that mere knowledge is of no inherent or intrinsic value if it is allowed to lie dormant and latent, but that its real value lies in its judicious use and application to purposeful ends, and that the capacity developed in its acquirement makes the students correspondingly competent to administer upon more and more difficult problems as they appear. Not only is the victory worth while, but the struggle is even more so. The faculty which believes in easy and lax methods and is indifferent in its graduation requirements and fails to advance very markedly the students' professional and personal ideals falls far short in the successful exercise of its duty and fails to recognize the very large opportunities for and the great privilege of rendering upward service which its place in the college gives it. In the ultimate the value of every individual to humanity is measured by the quality and quantity of service rendered, and, according to the law of cause and effect or the law of compensation, or whatever one may call that principle which balances things, capable and unselfish service weighs more heavily than any other factor. This matter of service is constantly impressed upon students by some faculties, and emphasis is laid upon the fact that any kind of training must include not only the possession of a sufficiently wide scope of knowledge and the ability to add to it and to employ it wisely and effectively, but also all those other virtues that mark and distinguish the cultured and refined and unselfish and devoted practitioner.

#### QUARTERS AND EQUIPMENT

Adequate quarters are a very real necessity for the conduct of the best kind of work. No matter how competent the worker, if he is not properly housed or quartered, he is unable to do his best. In general, quarters should be well located, abundantly lighted (naturally and artificially), consistently spacious, modern, sanitary, fireproof, well-adapted and preferably constitute a separate

building. The location determines in a large measure the usefulness of a college. Obviously, the college should be located in the largest center of population of a given geographical district, and the more convenient the location within this large civic center the better. If the quarters constitute a separate and well-planned and adapted building, the possibility of service is that much enhanced. In the planning of quarters, as a rule, not sufficient attention is given to the lighting problem. The quarters should be lighted naturally from all points of the compass and provisions should be made in the planning of the building for access of sufficient daylight. The quarters should be consistently spacious. Overcrowded and cramped quarters are not much better for efficient work than too spacious rooms, in which the traversing of large areas consumes much time and strength. It is obvious that the quarters should be modern, sanitary and fireproof. Good sanitary conditions are essential to good health and the safety of the occupants of the building requires that the latter be fireproof or that it have sufficient protection against fire. One of the most efficient protections against fire in buildings that are not fireproof is the sprinkler system. This is recognized by the fire underwriters, and buildings equipped with this automatic sprinkler system are insured at a much lower premium than other risks.

Equipment is another of the essentials for producing the best results in the work of a college. Equipment should be sufficient in quantity and adequate in kind and variety. It should be up-to-date, be extensively used, systematically kept and carefully inventoried. Much could be said on the matter of equipment, but time and space forbid.

#### CONCLUSIONS

A college which meets the standard I have hastily and all too incompletely presented to you, is fitted to render a service to pharmacy and to the public that is correspondingly equal to the service now rendered by any college representative of other professions. If all colleges of pharmacy were of this standard, their combined influence would soon place pharmacy into its rightful rank of co-equality with other learned professions. The service which a highly developed profession of pharmacy can render is as valuable, dignified, responsible and respectable as that which any similar agency in any human activity can render. Why should pharmacy be so modest and self-effacing as it appears at present to be? There is no reason that I would regard as sufficient. If pharmacy does not enjoy the same respect accorded to other learned callings, it surely is not because it does not merit similar recognition. At present pharmacy lacks self-assertion and the recognition of its rightful place in human affairs. Education is fundamental. Pharmacists as a class are under-educated, and for this condition they themselves are responsible. The awakening must come through pharmaceutical educators and through pharmaceutical educational agencies. Others will not elevate pharmacy, except that through widespread pharmaceutical incompetency a reaction might be initiated by the public which would demand a much higher grade of pharmaceutical service than is now the rule, and which it might seek to secure through legislation.

The St. Louis College of Pharmacy already meets in a very large degree the standard I have suggested. To meet it fully and even to exceed it is one of its

possibilities. With the sure foundation of fifty years of useful work and service, and with the valuable tradition behind it; with an enthusiastic faculty ever ready to recognize the growing needs of the times, and with a full knowledge of the necessity of valiant and persevering industry to succeed in the struggle of existence, the college is ready and willing and able to become acceleratingly useful with the passage of years. The history of the college is enviable. Its half-century of valuable service and influence has created for it the present duties of fostering even higher ideals; of entering upon an even more unselfish endeavor to stimulate and increase its service; of affiliating itself with every activity in the interests of higher educational and professional standards; of increasing its influence for better and higher pharmacy throughout the southwest, and thereby correspondingly throughout the country. The college, no doubt, is fully aware of these increasing duties and responsibilities, and can be trusted to meet them in a capable and competent manner, for it is written, "The glory of this latter house shall be greater than that of the former." The former house, your fifty years of enviable service, is the heritage into which American pharmacy has come; a heritage which we all cherish alike and which, full of honor and accomplishment and emulable tradition, becomes the foundation for the latter house. The former house was begun with splendid forethought and skill, with unselfish devotion to high ideals, with a consecration to high purposes and achievement, and with creative genius by those early pioneers in pharmaceutical education who have gone on to their reward, and whose courageous enterprise and hallowed memory we so deeply respect and honor, and to whom these splendid exercises are in a large measure dedicated. If all of those early founders could be with us to-night, how they could glory in their work, and how satisfied they could be with the structure for which they laid the foundation, and which their successors so nobly and unselfishly reared. Pharmacy owes them a deep debt of gratitude which can be repaid only by a continuation of their work in the same unselfish and sacrificing way in which they began it, and by a devotion to everything that tends to the fullest fruition of their noble aims. The latter house now to be reared is replete with possibilities of still greater service and achievement, the fruition of possibilities depending only upon the firm resolve and enthusiasm, courageous work and untiring perseverance of those entrusted with the continuance of the work so nobly begun by those who should be counted as among the fathers of American pharmacy. May they so build on that future generations may say, "They builded better than they knew."

## THE CULTIVATION OF MEDICINAL PLANTS.\*

---

F. A. MILLER, M. S.

---

A brief historical review of the subject of drug cultivation in the United States reveals the fact that the subject is not a new one. It is only the revival of an old topic under modern ideas and more attractive possibilities. Concerning the introduction of this work in America, we would doubtless be safe in saying that the first medicinal plants to be cultivated were the so-called "kitchen herbs" in the gardens of the earliest settlers. As early as 1735 Collinson obtained over fifty kinds of "curious seeds" from the Chelsea Physic Garden of England, and Marshall, 1781, was one of the first to attempt the cultivation of the opium poppy in this country. Small gardens containing miscellaneous collections of plants, some of which might be classed as medicinal, were started in different localities only to be abandoned after a few years. Most of these were established for educational purposes and some are still in existence. In these, however, medicinal plants did not predominate, but were only supplementary to certain other families or groups of plants.

Not until the early part of the nineteenth century did medicinal plant-growing appear to have attracted sufficient attention to be considered as a commercial enterprise. The American Garden Calendar enumerates a large number of plants which could be grown in temperate climates and gives general directions for collecting and drying herbs, roots, seeds, etc. In this connection some of our present investigators of medicinal plants seem to be following this early example of McMahon in his Garden Calendar in still enumerating long tedious lists of what they call important medicinal plants and which they emphatically claim could be cultivated successfully in this country upon a commercial scale.

The most extensive operations ever carried on with drug producing plants in this country, were those of the Shakers. They began the work as early as 1800 at the original settlement at Mount Lebanon, New York. It seems they soon established quite a business in medicinal preparations from their cultivated drugs and the work was subsequently taken up by other Shaker colonies, particularly at Union Village, Ohio. Some idea of the amount of drugs produced by the Shakers as compared with the present demands may be gained from the statement that they produced at Lebanon as much as forty or fifty thousand pounds annually. This amount would about equal the average weekly demands of any one of the larger manufacturing concerns of today. While this movement spread somewhat in the Shaker community it never became very general. The Tilden Company, of the same locality, are said to have had as much as forty acres planted to medicinal plants. We find, however, that the work of Tilden & Co. was discontinued about 1880, and the operations of the Shakers gradually diminished until they finally attracted no more attention.

---

\*A lecture delivered to the Purdue Pharmaceutical Society at Lafayette and to the School of Pharmacy at Valparaiso University.

In times past the United States has shown itself capable of supplying materials, not otherwise produced here, which have been cut off by conditions of war. This has been true of opium, which was produced in considerable quantities during the Revolutionary War, the war of 1812 and the Civil War.

At the present time we are feeling the strain of similar conditions and find many of the most important European vegetable drugs not only cut off from the regular channels of trade, but also declared contraband of war. The list of drugs of strictly European origin which might be successfully cultivated in this country is not a large one, especially when we consider only those which are actually essential to the modern practice of medicine and those which from the nature of the plant we might reasonably expect could be grown and cultivated with some degree of certainty. In this list we have such drugs as aconite, belladonna, colchicum, convallaria, digitalis, gentian, henbane, opium, stramonium and valerian. Before seriously considering the cultivation of any of these, they must be studied carefully for peculiarities which may make it impossible to grow them successfully upon a commercial scale. The first thing to consider before deciding what forms one would attempt to grow is a reliable seed supply. This question apparently does not worry the prospective drug grower until he is actually ready to begin, and some have been known to purchase land, erect drying shed, etc., before really knowing what they would grow, or where they could obtain seed of plants of the various medicinal forms.

In the above list, take for instance, aconite. Seeds of *Aconitum napellus*, the official species, may be obtained from several reliable seed firms of the United States. However, with good seed once in hand, we find that all difficulties are not immediately solved. The question at once arises as to how these should be sown. The average farmer or layman knows and considers but one method of seeding for commercial operations. This is the open field method and unless it can be practiced successfully there is little chance of rapid progress. Aconite is usually considered a tuberous rooted plant with the tubers constituting the part used in medicine, the leaves being little used. These tubers do not reach maturity before the end of the second or third season so that when successfully seeded the plants must be grown through two or more successive years before a crop could be harvested. As to seeding we find that aconite is not easy to germinate even under the most accurately controlled conditions of a greenhouse. This eliminates field sowing and greatly increases the cost of production to say nothing of experienced labor and unusual equipment, such as greenhouses and hot beds. Aconite is often grown as a garden form, where its tall, stately stems, surmounted by the spikes of dark blue flowers are both beautiful and interesting. This is no argument, however, that aconite would be an easy crop under field conditions. In this respect we find too many mistakes have already been made with medicinal plants. Many medicinal plants or their varieties have long been used as garden or decorative forms and upon this fact alone, sweeping statements have been made that they could be easily and economically produced upon a commercial scale. Even some college authorities who have strongly advocated drug cultivation have been accused of committing this error.

Whatever the sources of error, however, it is time for their correction as well as time for the adoption of more conservatism in the statements of those not in-

fomed upon the difficulties of commercial drug growing. To cite an example, a well-known writer in pharmaceutical circles, in giving directions for growing henbane, states in extremely brief language that "culturally it could be associated with stramonium, cannabis indica, tobacco and belladonna." The absurdity of the association of such a group of plants from the standpoint of production is self-evident. A biennial, if we are to consider the pharmacopeial species of henbane which reproduces from seed with much uncertainty, has given repeated crop failures in England and has been so difficult to handle in the United States that at one time the government, as well as some individual workers, had given up their investigations of it, is here classed with a group of plants containing annuals, biennials and perennials, of widely different cultural requirements. Of this group, stramonium and cannabis are annuals of very easy culture, probably no easier one could have been selected than cannabis, and the difference between its cultural requirements and those of henbane could hardly be greater. In the case of tobacco we have a plant, old in cultivation, where all details of propagation, cultivation and improvement have been highly perfected, as contrasted with henbane upon which practically nothing has been accomplished. Belladonna, the last named of the group with which henbane is associated, is a strict perennial of decidedly different requirements. It might be grown either as an annual, harvesting both leaves and roots at the end of each season, or left on the ground for three or four years, harvesting only the leaves annually. It requires a calcareous soil, and takes from four to six weeks for seed germination. We do not know the soil requirements of henbane and good seeds germinate in from six to eight days. As to the actual details of planting, cultivating, harvesting and curing, all of the above forms differ widely and no two of them could be handled by exactly the same method.

Returning to the list of plants under discussion we find that colchicum would give difficulties very similar to those of aconite. The parts used consist of the seed and the underground portion in the form of a corm. Seed may be obtained from manufacturers and crude drug dealers as well as from some European seed firms, but they appear to be very difficult to germinate. I have tried many samples from the colchicum seed of the drug markets and one sample from Haag and Schmidt which was supposed to represent fresh seed, but so far have failed to germinate any of them. The seed has a very hard resistant seed-coat and it is possible that some special treatment may be necessary to facilitate more ready and uniform germination. This difficulty alone is sufficient reason for discouraging any attempt at commercial production without some investigations.

Convallaria, another one of the drugs mentioned, presents a different story. The rhizome is most commonly used and there is probably sufficient of the plant already under cultivation in this country to meet the usual demands for some time. Supplies of stock plants can easily be obtained and propagation from root cuttings offers no serious difficulties. Convallaria would be one of the easier medicinal forms to grow should such procedure become necessary.

In belladonna we find one of the most important of the group of vegetable drugs. The commercial supply of the crude drug has come almost entirely from central Europe. This source of supply is now completely shut off by existing conditions and previous crops have largely passed into the hands of manufac-

turers. As to the near future, the prospects of the drug being collected and marketed are extremely poor. Thus belladonna is one of the most promising medicinal plants from the standpoint of commercial supply and demand. To correct a common and rather widespread idea that this plant might be collected from the wild source in the United States, it should be clearly understood that belladonna (*Atropa belladonna*) does not occur in the wild state in this country in sufficient abundance for collection. The belladonna of the United States is nothing more than the little night-shade, *Solanum nigrum*, of common occurrence and which could in no manner serve as a substitute for the true European belladonna.

During the past ten years considerable knowledge has been gained on the cultivation of belladonna in the United States. The investigations of the Bureau of Plant Industry of the United States Department of Agriculture have furnished some valuable information upon the behavior of the alkaloids in the belladonna plant. In California the cultivation of belladonna has been fairly well established in certain localities, but the amount of marketable drug produced there has so far not been sufficient to decrease the annual demands for the foreign drug. The development of this industry has been slow and expensive and many times so discouraging as to almost cause its complete failure and subsequent abandonment. However, the present opportunity promises to be a great stimulus to these efforts and should go far toward seeing belladonna culture in this country, placed upon a sound commercial basis.

Viable seeds of the true pharmacopœial species of belladonna may now be obtained from several reliable sources in the United States in sufficient quantity for both experimental and commercial plantings. One of the most discouraging features of the cultivation of belladonna is the long period required for seed germination. This difficulty places the production of the plant outside of the class of regular farm operations and compels the grower to adopt methods with which he is not ordinarily familiar. When we consider that the seed requires from four to six weeks to germinate, even when under the influence of greenhouse conditions, the difficulties of field sowing are at once apparent. In the central states where weed growth on cultivated land is so luxuriant that almost constant cultivation is required, beginning a few days after the crop is sown, there would not even be a "struggle for existence" in the case of belladonna, for the simple reason that it would rarely come into existence in competition with our rapidly growing weeds. In some of the southern states where growing weather extends through from eight to ten months of the year and where the fall growth of weeds is not a serious factor, field sowings of the seed might be practiced with some degree of success. In our locality, however, experiments extending over several years have demonstrated that the only sure method of obtaining a good stand is by forced propagation and final transplanting to the open field. As to the rate at which plants may be handled by this method we find that an experienced man will move from the seed pans to plant flats or pots, from fifteen hundred to two thousand seedlings per day. This is when the man is working alone and doing all the preliminary work such as soil mixing, filling flats, and other details necessary to such operations. Transplanting to the open field is usually performed at the rate of one thousand to fifteen hundred plants per day. A good man with two helpers to space and drop the plants will work somewhat

faster but his average will not greatly exceed fifteen hundred. Spacing the plants three by three feet in the field will require approximately forty-seven hundred plants per acre. Only rough calculations are necessary to demonstrate the need of cheap but efficient labor in handling a crop of this kind. A mechanical device has been constructed, however, which by the use of three men, not necessarily experienced in handling plants, and a two horse team, will transplant at the rate of from three to five acres per day, at the same time watering each plant and putting on an application of commercial fertilizer.

Everything is not accomplished, however, when the plants are successfully established in the field. In fact the work has only commenced. Subsequent cultivation for belladonna may be about the same as for corn until the plants begin to branch when some forms of single plow must be adopted. In the meantime the crop must be protected from insects and other plant diseases. In this respect the problems involved are somewhat different from those of regular farm crops. In this particular instance both the leaves and roots of the plant are used. This means that any arsenical insecticide applied to the plant, must be used with great caution, or the arsenic, held mechanically upon the surface of the leaves and stems will eventually find its way into some finished product. However, if persistent efforts are made during the earliest stages of growth, the common potato beetle, which is probably the worst insect to contend with, can be eliminated for the entire season. Thus, by the time the plants have reached a size sufficiently large for collecting, the first leaves of the young plants which may have received an application of insecticide have dropped from the stems. The safety of this procedure is evidenced by the free use of arsenicals on cabbage and other garden forms during the early stages of growth. Plant lice have also given serious trouble on belladonna but these can be controlled with any effective nicotine solution. The volatile nature of this substance makes it a perfectly harmless insecticide which may be freely used.

Having protected the plants from insects by some method and carried them safely through the growing season, the approach of harvest brings forth another series of problems. The first to suggest itself will have reference to the time of collection. When the final product is placed on the market its percentage of total alkaloids will be one of the important determining factors in judging the quality, and whether it is belladonna or some other form there will be some definite stage in the development of the plant when the yield of alkaloids or other active principles will be greatest. This condition should determine the time of collection and it can only be ascertained by the collection and testing of many series of samples.

Other questions which the grower would be compelled to answer would be the method of collection for both leaves and roots and the manner of curing these when once they were successfully harvested.

To continue with the list of European drugs we find that it is the opinion of many practitioners that really active digitalis comes only from England, Germany, or some other source, known only to the man who compiles the information on the label. There is in Oregon and Washington an abundant growth of good digitalis which shows an equal value with either the German or English drug. This source of supply could easily take care of the entire demands of the United States. With this abundance of material within easy access it would not be

necessary or wise to attempt the commercial cultivation of *digitalis*. Those wishing to do so may easily obtain seed of *Digitalis purpurea* from any reliable seed firm. It cannot be sown in the open field, as several writers have stated, but must be propagated about the same as belladonna. It is a hardier plant, however, and may be carried through the seedling stage at a somewhat lower temperature. It flourishes in the ordinary cold frames and may be placed in these with perfect safety as early as March 1st. Only the leaves of this plant are used. The present pharmacopœia requires that these be collected from flowering plants. It is possible, however, that the revision committee will respond to the influence of recent research upon this subject and eliminate that part of the requirement which refers to the flowering plants. *Digitalis* being a biennial, the present pharmacopœial requirement makes it impossible to even think of growing the drug at a profit. Indeed it is doubtful whether it could be cultivated and harvested at the end of the first year with any hope of financial returns.

Gentian was another of the drugs mentioned and is one which holds a rather important place in medicine. It would be a promising drug plant to have established in this country, but we must begin at the beginning. Let us not prepare to grow gentian until we at least have gentian to grow. As in many other instances we find that we cannot obtain good seed of *Gentiana lutea*. I have had seed of this species from Erfurt, Germany, but it failed to germinate. Looking a little further into the history of the plant we find it to be a perennial of which only the roots are used. If we had an abundant supply of good seed with which to begin tomorrow, we could not under these conditions expect to harvest a crop at the end of the present season.

Concerning henbane it is only to be regretted that the United States is not now prepared to produce its own supply of this valuable drug. It is not, however, and the few individuals who have been attempting to grow it should not be discouraged when the government which is at present leading the movement in drug plant cultivation, has almost failed in its attempt to grow the plant. Good seed of henbane is difficult to obtain and I would not advise any one to depend upon those which have not first been thoroughly tested. I have isolated an annual strain, the seed of which germinates quickly and uniformly. Several hundred plants of this strain will be grown this year. This should be a sufficiently large number of plants to test the strain for commercial purposes. The official biennial species has been hard to grow to maturity. Once this is accomplished and a good supply of fresh seed obtained the work on this form should progress more rapidly. One of the worst things to contend with in growing henbane, even on a small experimental scale, is the ravage of the potato beetle. It has been almost impossible to protect the plants from this insect even by the use of the most effective poison.

Concluding with stramonium we find that what was said of *digitalis* will apply in some degree to this form. With the wild plant growing abundantly in the United States, there is some question of the advisability of attempting its cultivation. It is usually supposed that stramonium will grow in spite of itself, but such is not the case and good results could only be expected on rich soil and by the practice of clean cultivation.

This leads us into a discussion of the problems of drug cultivation from a dif-

ferent viewpoint. We have too often heard of the fortunes to be derived from weeds, of the statements that this or that plant will grow and flourish anywhere and we as often wonder upon what type of reasoning such statements are founded. We know that history records but very, very few fortunes as having originated from weeds except probably through their elimination. It is also evident that all plants now known to man, do possess selective properties which enable them to reach their maximum developments only under environmental conditions which are within certain definite limits. The mere fact that a form has been observed growing as a weed is not good evidence that it will behave in a similar manner when introduced into cultivation. In fact, this is not what we desire. If we merely wish to grow them as weeds and thereby realize an abundant profit we had better stop where we are now, for we would likely derive neither weeds nor profit. What is most desired is to grow medicinal plants not as weeds, but as cultivated plants, improved, perfected and developed in the same manner and to the same degree of perfection as already obtains in the case of other economic forms. To merely grow medicinal plants upon a commercial scale is not sufficient. In fact it is very doubtful whether or not most of them can be produced economically unless some form of improvement is followed. We cannot compete with European producers upon a mere basis of equality. We may be able to compete with them, however, by increasing the quality and yield of the drugs through improvement. This can only be brought about through careful breeding and selection.

The field of research in this respect is almost unlimited and practically untouched. There is hardly a vegetable drug of any importance that does not suggest opportunity and the possibilities for improvement in this line of work. We only need turn to a careful consideration of existing conditions with reference to such drugs as henbane, belladonna, digitalis, stramonium, cannabis, and others for these suggestions. Henbane of disgraceful appearance and low in alkaloidal value is admitted to the United States in order to meet the constant demand for this drug. We have an official description of this drug and a species requirement, but who knows or is able to determine what species are actually included in the crude drug of European origin. From the appearances of many shipments it seems that every species, both plant and animal, which might inhabit the average barnyard has been included in the make-up of this drug. Here is abundant evidence of much needed improvement and it can best be accomplished by the introduction of this plant into cultivation and its subsequent improvement by breeding and selection. The testing of other species of *Hyoscyamus* may lead to the discovery of a more valuable form, and while Schneider says that the annual form of henbane is not desired medicinally, let us not despair since we find that this annual form has really never been tested thoroughly for its alkaloidal and therapeutic value.

Belladonna is in the same class with henbane, and while the range of species is not so large, still there is the variety *lutea*, which has so far never been tested. Seeds of this variety were brought to this country by Professor Henry Kraemer and through his kindness we now have this form growing in our experimental grounds. It offers an opportunity for hybridization with the official species *Atropa belladonna*. Sievers, of the Bureau of Plant Industry, has already shown

what may be expected from consistent selection with the official belladonna. Further work of this nature, but leading to increased yield, together with a better understanding of soil and climatic condition is highly desirable. A similar series of investigations is suggested by the genus *Datura*. Here, however, the range of species is much greater and the variation in the nature of the alkaloids in the various species is such as to present problems of a different character, and which should lead to the use of some of these species for different specific purposes. The species *Datura tatula* has recently been shown to be equal to or better than *Datura stramonium* in the percentage of alkaloids. Both of these species have yielded to selection and hybridization in such a manner as to promise the early development of a much-improved strain. Turning to *digitalis*, we find a host of species and horticultural varieties of unknown therapeutic value which should furnish an abundance of material for the investigator. Many of these have been found to be extremely toxic, both in the flowering and nonflowering stages.

And so the discussion might be continued in detail for *cannabis*, *conium*, *colchicum* and any others that might be grown within the United States. Sufficient has been said, however, to draw attention to the many difficulties that may be encountered in attempting to grow medicinal plants upon a commercial scale, and of the opportunity and desirability for improvement. The beginner in this work should be advised to commence upon a small, experimental scale with a few of the most valuable drug-producing plants and enlarge his operations as results might indicate. The value of the work cannot be questioned, and while it is vitally important that medicinal plants be grown with the same care and consideration as in the case of corn, wheat or other economic forms, still the step from the wild plant to the highly developed variety of known constitution is a long one and cannot be accomplished in a few days.

It is hoped that nothing has been said which will tend to discourage the present widespread movement in drug cultivation. Rather, we would wish to encourage it but in such a manner as to lead to a fair understanding of the true state of affairs and to dispel the idea that large profits may be expected.

BOTANICAL DEPARTMENT, ELI LILLY & COMPANY, Indianapolis, April 8, 1915.

### THREE INTERESTING INCOMPATIBILITIES.\*

WILBUR L. SCOVILLE.

The first deals with the action of light and heat on the organic acid salts of the cinchona alkaloids.

In 1853, Pasteur found that on heating acid sulphate of cinchonine to 130° C. for several hours, a poisonous compound was formed which was isomeric with cinchonine. This for many years was regarded as one of the curiosities of cinchonine, possessing no practical interest, because in the use of cinchonine it never became necessary to heat it in this way, and consequently no change was expected. Hesse

---

\* Presented to the Detroit Branch, A. Ph. A., Feb. 19, 1915.

(1868, 1873 and 1875) studied the reaction several times in establishing the constitution of cinchonine, and Howard (1872) and Roques (1895) also studied it.

In 1805, Miller and Rhode found that on heating cinchonine with acetic acid at 100° C. for several hours, a similar compound was formed but which crystallized in a different form. Pasteur had called his product *cinchonicine*, and Miller and Rhode called theirs *cinchotoxin*, but in 1900, Brinner showed that the two substances were identical and that the body crystallizes in two forms.

In 1912, Prof. H. C. Biddle of the University of California, made a study of this reaction at temperatures of 100° C. and also at 36° C. with a view to learning whether this compound was likely to influence the therapeutic action of quinine or the other cinchona alkaloids.

Cinchonicine or cinchotoxin is an isomeric form of cinchonine, one hydroxyl group being changed to a ketone group. This change entirely destroys the febrifuge action of cinchonine and it becomes strongly poisonous. The new body resembles digitoxin in its action, inducing convulsions and death in sufficiently large doses. A similar change occurs with quinine, but quinicine (or quinotoxin) is not as intense in its action as cinchonicine.

Biddle found that by heating either quinine or cinchonine in the presence of acetic, citric, tartaric, lactic, formic or malic acids, the alkaloids were completely converted to the poisonous isomer in from 24 to 48 hours at 100° C. Half of the conversion, he found, takes place in the first six hours. The change is shown by a darkening of the solution, and a lesser solubility of the product.

The color is a good indication of the change, the depth of color being proportionate to the amount of conversion. With sulphuric and hydrochloric acid there is no conversion, and when these acids are present in excess the change with organic acids is almost entirely prevented.

The change was also studied by Professor Biddle at 36° C.—approximately body temperature. As might be expected, it occurs much more slowly at this temperature, being less than 2% of conversion in 36 hours. But that it occurs at all at this temperature is significant, and stands as a warning for pharmaceutical combinations.

The change is induced by sunlight as well as by heat, and it has been shown that the brown color observed in bottles containing quinine, cinchonine, etc., and their salts, which have been exposed to light during long periods, is due to a small amount of these toxic compounds.

Pharmaceutically the change occurs most frequently in elixirs and syrups containing quinine in combination with iron citrate, such as Elixir of the Phosphates of Iron Quinine and Strychnine, Syrup of Iron Quinine and Strychnine Phosphates, etc.

These, as is well known, tend to darken on storage, especially if exposed to light, and the presence of ferric salts accelerates this action. This darkening is due in part to the change in the quinine by action of the organic acid present and promoted by heat or light. That an elixir or syrup so darkened is not only unsightly, but is also poisonous from the presence of quinotoxin, is the fact to be borne in mind. Doubtless some cases of "idiosyncrasy against quinine" are due to the presence of the isomeric and toxic body.

Such preparations should be stored in amber bottles, and should not be dispensed when a decided darkening has taken place.

Professor Biddle further cautions against the free eating of acid fruits when taking quinine as being liable to form enough of the toxic body to produce unpleasant results.

An interesting instance of the probable quinine combinations which may be made, and which need caution in storing is the following prescription which was recently brought to my attention:

R	Aspirin.		
	Quinine Sulph.....	55	5ss
	M ft. capsul.....	xii	no.

This prescription was compounded and not called for. At the end of about a year the druggist found that the mixture had liquefied in the capsules, and asked for an explanation. It is probable that a series of reactions had occurred.

First, the water of crystallization in the quinine sulphate may have decomposed the aspirin, liberating salicylic and acetic acids. (The liquid in the capsules had an odor of acetic acid.)

Second, the acetic and salicylic acids converted a part of the quinine, forming quinotoxin, which is a liquid at ordinary temperatures.

Third, the quinotoxin, being a ketonic body, is likely to form an eutectic with salicylic acid, and if this eutectic melts at ordinary temperatures the liquid would thus be further accounted for.

There is some ground for this view, because a mixture of aspirin and quinine sulphate, when heated in a steam bath, soon liquefies and darkens. Quinotoxin is not as dark as cinchotoxin, but forms a brownish-yellow oil which does not crystallize easily. Hence, a slight darkening with quinine means more than with cinchonine. Quinine sulphate with acetic acid does not liquefy, but it does with salicylic acid.

Preparations containing quinine or other cinchona alkaloids, in combination with or in the presence of organic acids, should not be heated nor exposed to a strong light, and if stored for any length of time should be observed carefully. They are safer if a small proportion of free mineral acid is also present. This hinders the change, or may prevent it entirely.

The second incompatibility which I wish to discuss is that of ferric salts on organic acids induced by light.

A few years ago I was called on to explain why Wine of Beef and Iron, containing 20% of alcohol, persisted in fermenting. Sterilization and the presence of antiseptics did not prevent it, but it was noticed that the change, which closely resembled alcoholic fermentation in its physical aspects, and which gave off carbonic dioxide, seemed to be hastened by sunlight. Finally a sample, which showed a considerable pressure when the cork was removed, and which had all the appearance of active fermentation, was proved not only to be sterile itself but to be incapable of growing bacteria or yeasts which were added to it.

Sterile fermentation was certainly something new!

But that it could be anything but fermentation did not occur to me until its sterility was absolutely proved.

About this time abstracts of experiments upon the chemical action of light be-

gan to appear frequently in chemical literature, and this gave the clue to the true cause of decomposition.

Sunlight decomposes many organic compounds, and among the more sensitive are the organic acids, notably citric, tartaric, and lactic acids. This action is accelerated by ferric salts, which are thereby reduced.

Thus Wine of Beef and Iron, whether made from ferric citrate or tincture of citrochloride of iron, contains the iron in the ferric condition and also a citrate. It is furthermore acid in reaction. Hence, in the presence of strong light the iron is gradually reduced to the ferrous condition and the citric acid is completely oxidized to water and carbon dioxide. Like many other reactions, after once started it proceeds more vigorously, and may be energetic enough to burst the bottle.

Amber bottles, of course, inhibit this action. Neither does it occur in the presence of ferrous iron, at least not as vigorously.

In a diffused light the action is slow, yet I have had a bottle of tincture of citrochloride of iron develop considerable pressure while standing on a laboratory shelf where the direct rays from the sun never reached it, in the course of about two years. In direct sunlight this tincture will show an evolution of gas within a few hours.

The iron elixirs, bismuth elixirs, and most liquid ferric preparations are subject to this reaction. They should never be exposed to the direct rays of the sun and are much better preserved in bottles of amber glass.

The third incompatibility deals with combinations with boric acid. You are all doubtless aware of the fact that glycerin will decompose borax and change it from an alkaline to an acid reaction. This has usually been explained as first a combination in which the glycerin unites to form glyceryl borate and liberates sodium metaborate and water, then the water in turn decomposes glyceryl borate and liberates glycerin and boric acid. So the end products have been said to be sodium metaborate, glycerin, boric acid and water.

This reaction was very simple and satisfying—on paper—until in 1911 W. C. Duncan, Ph. C., of Edinburgh, in a paper published in the *British Pharmaceutical Journal*, pointed out these faults in the reaction. First, that compound esters are not easily formed in the presence of water; second, that such esters are hydrolyzed slowly, not instantaneously, by water; and third, that the liberated acid is much more active chemically than boric acid, for it causes vigorous effervescence with carbonates, whereas boric acid reacts sluggishly with carbonates. He found also that the amount of glycerin necessary to produce an acid reaction is two molecules of glycerin to one of borax, but if a permanent and active acidity is desired four molecules of glycerin must be used for each molecule of borax, or practically an equal weight, and this equation does not balance on the glycerylborate theory.

Mr. Duncan's explanation is that a new acid, glyceroboric acid, is formed which is analogous to glycerophosphoric acid, and is much more active chemically than boric acid.

Mr. Duncan attempted to prove this, but did not succeed in separating the pure substance from its excess of glycerin, and also failed to separate pure salts of lead, barium, calcium and magnesium which he prepared. But he did show that a number of reactions which occur with glycerylboric acid do not occur with ordinary boric acid, and the evidence is strong that the former acid is formed. Simi-

lar combinations occur with sucrose, glucose, and manitol, and with tartaric and citric acids.

Some time ago a complaint was made that an antiseptic tablet containing mercuric chloride, ammonium chloride, tartaric acid and boric acid did not keep well.

Examination showed that the tablets had a marked odor of hydrochloric acid, and subsequent experiments showed that the boric and tartaric acids had combined to form a borotartaric acid which was active enough to decompose ammonium chloride and liberate hydrochloric acid therefrom. Borotartaric acid was a somewhat familiar article in pharmacy fifty years ago, when its chief interest lay in the solubility, which is far greater than boric acid alone. But that the combination was powerful enough to liberate hydrochloric acid from ammonium chloride was not suspected.

Except for antiseptic washes and collyria, borax and boric acid are not prescribed often, but occasional combinations are found in which it is interesting to note that boric acid is not boric acid.

#### DISCUSSION.

In the discussion which followed, Mr. Mann stated that he had personally experienced very unpleasant results in a recent treatment of a hard cold, which he thought must have been due to taking rhinitis tablets (containing quinine sulphate) and aspirin at short intervals. A rash appeared which could not be accounted for in the normal course of the disease, and which was severe for a short time.

Mr. Seltzer stated that he had known of a number of cases of unpleasant results following the administration of quinine and aspirin in combination, and is now warning his physician-patrons of this incompatibility.

He thought that quinine and aspirin should not be administered together, or in sequence at short intervals.

Another interesting incompatibility which had recently come to his attention was the administration of hexamethylenamine in gelatin capsules. When these were taken into the stomach the gelatin softened and swelled, a small amount of the acid juices penetrated the capsule and started decomposition of the hexamethylenamine and the formaldehyde liberated acted immediately on the gelatin, rendering it insoluble and the capsules failed to dissolve. He cited one instance in which an active cathartic had resulted in a patient voiding a number of such capsules in an insoluble condition.

Mr. Seoville said that this is a particularly interesting case of incompatibility, gelatin being very sensitive to the action of formaldehyde, and such a condition as Mr. Seltzer had described was quite probable. Gelatin treated with formaldehyde has been recommended for enteric coatings, but while such a process was practical under proper conditions and adjustment, there was much danger of overdoing it and obtaining a wholly-insoluble instead of an enteric coating. The recommendation which had recently appeared in drug journals, to immerse gelatin capsules in a 10 percent formaldehyde solution for five minutes, then drying them and using for enteric capsules, should be condemned, because the result will be, not an enteric capsule but an insoluble one. Gelatin is so sensitive to the action of formaldehyde that minute traces show its effects.

The use of formaldehyde is more likely to result in an artificial leather than in an enteric coating.

# NEW METHOD OF MAKING SYRUPUS HYPOPHOSPHITUM, U. S. P., AND SYRUPUS HYPOPHOSPHITUM COMPOSITUS, U. S. P.\*

F. A. UPSHER SMITH, PH. C.

The pharmacist who wishes to make the official syrups of the hypophosphites encounters the fact that it is necessary to keep on hand five different salts, viz., the hypophosphites of calcium, iron, manganese, potassium and sodium. Even if he has a package of each of these salts it often happens that one or more of them are not on hand in sufficient quantity, or that the hypophosphites of potassium or sodium have deliquesced beyond the possibility of weighing them.

When I was with Noyes Bros. & Cutler, it occurred to me that a formula might be devised for making such syrups by taking advantage of the fact that these hypophosphites are all readily made from the calcium hypophosphite. This conjecture proved to be correct, and I obtained permission from Mr. C. R. Noyes to publish the formula.

In explanation of the process, let me remind you that when a solution of calcium hypophosphite is mixed with a solution of sodium sulphate in equimolecular proportions, these salts interact with formation of sodium hypophosphite, which remains in solution, and calcium sulphate, which settles as a white precipitate, insoluble in the liquid. If we take in this way a solution containing potassium sulphate, manganese sulphate, sodium sulphate and iron tersulphate, and add it to a solution of calcium hypophosphite, the resulting solution will contain the hypophosphites of potassium, manganese, sodium and (ferric) iron, while the precipitate of calcium sulphate is separated by filtration.

An excess of calcium hypophosphite is added to be retained in solution as such, according to the dosage of calcium hypophosphite required by the formula, and a further excess of calcium hypophosphite is added for the purpose of producing the correct amount of hypophosphorous acid, by decomposition with a carefully calculated equivalent quantity of sulphuric acid. The resulting solution is rendered stable by acidifying it in this most natural way with the free hypophosphorous acid so formed.

The formula which I have calculated out along these lines for *Syrupus Hypophosphitum Compositus*, U. S. P., reads as follows:

Calcium Hypophosphite .....	67.80 gms.
Hot Distilled Water.....	400.00 cc.
Diluted Sulphuric Acid, U. S. P.....	2.20 cc.

Dissolve and add the following solution:

Potassium Sulphate .....	14.63 gms.
Sodium Sulphate .....	26.53 gms.
Solution of Ferric Sulphate.....	3.38 cc.
Manganese Sulphate .....	2.40 gms.
Hot Distilled Water.....	150.00 cc.

When mixed add a solution of:

Sodium Citrate .....	3.75 gms.
Hot Distilled Water.....	5.00 cc.

\* Read before the Minnesota State Pharmaceutical Association.

Let stand over night, filter, then add:

Quinine Alkaloid .....	1.106 gms.
Strychnine Alkaloid .....	0.115 gms.

When dissolved, add:

Sugar .....	715.00 gms.
Distilled Water, q. s. to.....	1000.00 cc.

Dissolve sugar in cold water, strain through cotton and add water q. s. Keep in amber bottles.

A sample of the first batch of the syrup made from this formula, dated January 9, 1913, is here for your inspection, in the original bottle in which it was placed. You will notice that it is perfectly bright and clear, with an attractive yellow color. (Sample was exhibited by author at meeting.)

A few weeks ago I constructed a formula for making *Syrupus Hypophosphitum*, U. S. P., along similar lines, and am using the formula in my store:

Calcium Hypophosphite .....	70. gms.
Hot Distilled Water.....	450. cc.

Dissolve and add:

Diluted Sulphuric Acid, U. S. P.....	1.50 cc.
--------------------------------------	----------

When mixed, rub in a mortar with

Potassium Sulphate .....	12.50 gms.
Sodium Sulphate, dried.....	10.00 gms.

Let stand over night, filter, and in the filtrate dissolve, in the cold:

Sugar .....	650.00 gms.
-------------	-------------

Previously mixed with:

Tincture of fresh Lemon Peel.....	5.00 cc.
-----------------------------------	----------

Finally strain through cotton and add:

Distilled Water, q. s. to.....	1000.00 cc.
--------------------------------	-------------

Keep in amber bottles.

Although at first glance these formulas may appear to be more complex than those of the U. S. P., yet in practice they are easily worked, and they present the great advantage that the pharmacist needs to carry in stock for making these syrups only one hypophosphite, viz., calcium hypophosphite, which is the most stable, the most reliable and by far the cheapest of the hypophosphites. Without any preliminary practice, I am confident that you will be able to make your stocks of these two syrups by the litre or by the barrel, with satisfaction to yourselves, the physician and the patient.

## IDEALS IN PHARMACY.\*

THEODORE J. BRADLEY, DEAN OF THE MASSACHUSETTS COLLEGE OF PHARMACY.

As this is the day on which you receive your degrees and commence to be graduates in pharmacy it is an appropriate time for you to consider your future course, and I wish to call your attention to some of the conditions that confront the pharmacist today, and have you consider with me certain of the principles that should be adopted and followed by every pharmacist who is to achieve a success that shall be permanently satisfactory to himself.

\* An address given at the 1915 Commencement Exercises of the Albany College of Pharmacy.

You have chosen one of the oldest of the professions and one that has undergone many changes. In ancient times and during the dark ages medicine and pharmacy were practiced as one profession and such crude surgical work as was attempted was done largely by barbers. The successive periods in the development of mankind from utter savagery are generally designated by the materials from which our utensils and weapons have been made, as the stone age, the bronze age and the iron age, in the last of which the people that we say are civilized are now living. This present period could very well be sub-divided according to the sources of our medicines. In olden times parts of animals were used, empirically and often superstitiously, then herbs or simples and teas, then various mineral substances, followed by the tinctures and extracts of the early nineteenth century, these in turn largely displaced by the alkaloids and other active principles of plants and by various mineral drugs. Very recently we have made large use of synthetic compounds from coal-tar and similar sources, and, finally, we are entering a period characterized by the use of serums, antitoxins, animal extracts and similar products. Of course these periods are of varying length and overlap each other, and the most valuable drugs of former periods have been retained and probably will be for an indefinite time.

Each of the periods mentioned has been marked by an advance in medical knowledge and this has frequently made it necessary for the pharmacist to adapt himself to changing conditions governing the practice of his profession. At no time in the past have conditions changed more rapidly than they are changing now, and, when I hear a pharmacist complain of his profession, I wonder if the profession is to blame or his own lack of the adaptability necessary to adjust himself to changing conditions. Such complaints are frequently heard and many men oppose the changes, often to their own undoing.

The pharmacist is both a business man and a professional one, in about equal measure, and the general public's recognition that our calling has a professional aspect is one of our most precious possessions and we should do all we can to increase our standing as professional men. In continental Europe the practice of pharmacy is so restricted that there is no likelihood that the pharmacist will lose his professional standing, but in America and Great Britain there has been, recently, a large development of the commercial side of pharmacy, and we are in great danger of becoming mere buyers and sellers of goods. In fact many pharmacists seem anxious to exchange their birthright of recognition as professional men for a mess of pottage in the form of what is termed commercialism. The ideal pharmacist is the one who has retained his professional standing and used it to aid him in achieving commercial success. If we are to continue to be more than merely tradesmen it is necessary for pharmacists to realize this present danger and to overcome it by living up to the ideals of their profession. There is no incompatibility between professionalism and commercialism in pharmacy if they are developed side by side, each in its proper proportion and not at the expense of the other. It is difficult to control this matter by law in this country because of the great American principle of the liberty of the individual, but various attempts are being made to formulate laws to this end and we watch their progress with interest. It is obvious that a man cannot become a successful pharmacist unless he is a good business man, but neither can he become a success-

ful pharmacist unless he is a pharmacist. It may be that reasonable and equitable laws can be secured that will recognize that the practice of pharmacy is as personal as the practice of medicine, or law, or any other profession, and that such practice and the proprietorship of drug stores should be restricted to registered pharmacists. But pharmacists cannot expect the benefits of such laws unless they continue to show that they are professional men with professional ideals.

The frequently enacted special laws regulating adulteration, the sale of alcoholic liquors, the sale of poisons, and similar matters, put on the well-meaning pharmacist a burden that he must bear because pharmacy has in its ranks some men who are a discredit to the profession. All physicians and all lawyers suffer in the same way from the misdeeds of a few quacks and shysters. Many of these laws are proposed by men who see a real or imaginary evil to be remedied, but who know little or nothing about pharmacy or medicine. In dealing with these proposed laws the pharmaceutical associations show their value. These organizations are generally able to prevent the enactment of foolish and harmful laws and to secure the modification of objectionable parts of necessary laws, so that they do not oppress the pharmacist who knows his work and is trying to do right. As an example of this value of the associations may be cited their work on the national anti-narcotic law which has recently become effective. All who had any knowledge of the growing use of habit-forming drugs realized that strict regulation and control of their sale were necessary, but the first bills brought before Congress included many regulations that were impossible of enforcement and which would have worked great hardships on pharmacists and physicians. The national pharmaceutical organizations, including those of the retailers, wholesalers and manufacturers, promptly formed a joint committee which met several times at Washington and was able to show the unreasonableness and impracticability of the objectionable sections so conclusively that the bills were amended and combined and finally passed in a workable form. This beneficial influence on legislation constitutes only one of the reasons why every pharmacist should be a member not only of his local and state associations, but of both national pharmaceutical associations as well. They deserve and need his support and he receives a great deal in return for the moderate yearly cost of membership. The resultant contact with the leaders in his profession, which is enjoyed in these organizations, helps to broaden and develop a man as nothing else can do.

Besides these questions and others of general interest to pharmacists, there are some of just as great importance, but which are of personal and individual application.

During the past two years you have rapidly developed, and largely increased your knowledge or you wouldn't be here today. It is now necessary for you to decide whether or not you are to continue this development, and progress, or stop it, and regress. The New York State pharmacy law requires that a pharmacist shall have a minimum education of a general and a special nature. Education informs and develops the mind and the studies pursued in a pharmacy course do these things in about equal measure. What they lack is the cultural value possessed by the languages and history, which is of great benefit in the polish it gives to great minds, but is likely to lead to intellectual snobbery in little minds. Appreciate your education and build upon it, but do not misap-

prehend its value. After we have acquired the most elementary subjects, the value of our education is shown by what we can understand and do, rather than what we remember. You have learned much of the theory and practice that are essential to the trained pharmacist, but this knowledge forms no more than a set of tools with which you are to fashion your careers. If you have studied with no worthier motive than merely to pass your examinations and graduate, and with no real interest in the subjects themselves, and if the faculty has done no more than to teach you a mass of facts, more or less scientifically classified, you and they have failed in your work together. Your course has been successful, only if they have helped you to develop your powers so that you can understand and interpret facts and theories, think for yourselves and work independently. This day is only one of the prominent milestones in your journey through life. You must pass others, but you will not travel far if you know only what has been learned from teachers and can work only under supervision. Each of us has two kinds of education, one that is received from teachers and one that we give ourselves. We receive no diplomas from the courses we give ourselves, but they count heavily in the casting up of our lives' achievements.

A tendency that every one should guard against is the narrowness that is likely to follow close application to one kind of work. One of the chief features of our modern industrial organizations is specialization in work. If such specialization leads to thoroughness it is fine, but if it leads to narrowness also, it is vile. We no longer commission a shoemaker to shape a pair of shoes to our individual measure and expect that he is to do all of the work on them himself, but we buy a ready-made pair that is exactly like many others that have been turned out in a factory where dozens, perhaps hundreds, of men and women have each contributed a small bit of work to them. This modern method leads to economy and uniformity and style, but not always to quality, and never to versatility in the workmen. We are becoming so dependent upon each other that there may be a seriously bad effect upon the race after a few more generations. Perhaps this danger from specialization in work is not near to pharmacists, but, nevertheless the tendency to specialize is here. In the larger stores we now hire prescriptionists, store clerks, soda clerks, porters and others for special lines of work, so that the drug store boy, who did all of these things in turn and as a part of his apprenticeship, is fast disappearing. The clerks have an easier time now and are undoubtedly more comfortable in their work, and probably this is a real improvement in conditions, but we should not allow this tendency to specialize to dominate our own work unless we have already mastered all of the tasks of the modern drug store.

Every pharmacist should cultivate the habit of reading several of the drug journals and occasionally he should buy a new book on pharmacy or one of the related subjects and read that also. This will keep alive his interest in these subjects and inform him on new developments. Antitoxins and biological products do not yet receive much attention in the pharmacy curriculum, but pharmacists should be informed on them and I commend to you, for immediate post-graduate study, a course of reading on these new products.

One of the most satisfactory and profitable assets a pharmacist can have is a reputation as a scientific worker. I have in mind one man who has a drug store

in a city with fifteen thousand inhabitants. Some years ago, after graduating in pharmacy, he did some advanced work in bacteriology and used that and his knowledge of chemistry in working up a practice in clinical testing for the physicians of his city. He was soon appointed city chemist and bacteriologist, at a moderate salary for a small amount of work, but the prestige derived from this position has secured the best trade of the city for his store and his customers are willing to pay advanced prices because of the confidence they have in his products. All of us cannot do just as this man has done, but we can find similar opportunities if we look for them.

After securing the proper training it is necessary that we believe in ourselves. Opportunities constantly present themselves to us. We may have the training which prepares us to profit by them but we need also backbone enough to embrace them. Not long ago the college with which I am now connected was asked to recommend a man to take charge of the pharmacy department in a state university, a position that is attractive in all ways. The university is located in a beautiful town, the salary to start with was \$1500 for nine months' work, and there was a great opportunity for the right man to build up a strong department. After considering the matter we suggested two men, both of whom appeared to fill the requirements. The first was selected because he was among the honor men in his class, and the other because of his manliness and ability to make friends. The latter was a good student, though not a distinguished one. What happened? The university wrote to both men and the first one refused to consider the position because, as I understand it, he lacked confidence in his ability to fill it. Of course his reason appeared good to him, but I would much rather have had him undertake the work, as I feel sure that he could have done well in it. The other man secured the position and has been markedly successful in the work. He may not be as distinguished a scholar as the first man, but he makes up for this by a good measure of that quality we call gumption.

It is probable that every one who makes his own way in the world wonders, at one time or another, if he would have been more successful in some other calling than the one he chose to follow. Such thoughts are fruitless and unprofitable after we are established in a definite line of work. If we have the essentials for success in our make-up we shall have some measure of success in the work we are doing; lacking these essentials we should not be successful in any other work. This is true of all callings, except those which require natural artistic gifts. We should not allow ourselves to be influenced by some who can see no good in pharmacy as a profession. Every kind of work has its difficulties and we are likely to magnify those in our own path because we are so near them. We should choose to be with those who square their shoulders and overcome their difficulties rather than with those who are themselves overcome.

With all the changes that have affected pharmacy, conditions are better now, both for proprietors and for clerks, than ever before. A boy without any capital may decide to study pharmacy and it is entirely possible for him to earn his living while obtaining the store experience which is an essential part of his preparation. As his experience grows his compensation is increased and he can work for a part of his time while attending a college of pharmacy, earning enough to pay his expenses. When he completes his training and becomes a registered

pharmacist he has his choice of several good-paying positions, and it is not at all difficult for a dependable man to secure a store on a small first payment and then make the store earn the amount necessary to finish paying for itself. How different these conditions are from those governing other professions, like medicine or law. A man who chooses either of those professions must complete a college course and spend some time in hospital or law-office with little or no compensation, and then wait for an indefinite period before he can secure a practice sufficient to support him.

But the man who is to succeed must have certain qualities that are only indirectly connected with his education. The faculty has talked to you so much in college courses about the necessity and value of study that I feel that I should now caution you not to over-estimate the importance of knowledge. You have acquired much more than the average amount of education or you wouldn't be here today, but do not for a moment deceive yourselves into believing that a complete man is made by any amount of knowledge. Your happiness and success will come, mainly, from your character and health and common sense and industry. Many great opportunities come to all men who possess a good measure of these qualities in this country of ours. Your superior education only prepares you to profit by these opportunities to an extent far greater than can the poorly-educated man.

You should appreciate the importance of striving to do right at all times. The man who is trying to do right has a weapon that makes him invincible if he but use it. Remember that your acts and achievements are thrown back on the college which trained you. Your credit will be its credit and your shame would be its shame.

This room is filled with your friends; mothers, fathers, sisters, brothers, and, I trust, sweethearts. Each of you is now, or soon will be, able to support a wife, in comfort if not in luxury. I advise you each to find one by all means. If you get the right one you have a help, not a hindrance, and you become immediately a more dependable man. The world will respect you accordingly and the happiest men are those who are well married. A word to the wise is sufficient, so I shall not pursue this topic further.

In this talk I have asked you to keep alive the professional ideals of pharmacy, to support the pharmaceutical organizations, which will return to you much more than you give to them, to continue your personal development and to adopt high standards of conduct for yourselves. In conclusion, I want to add that the best policy that a man can have is to strive to do right because it is right. Be sure that the things you work for are real. Remember that money-making is not the only possible kind of success and don't mistake the glitter of ephemeral pleasures for the solid gold of abiding happiness.

## THE ANALYSIS OF DATURA STRAMONIUM LINNÉ.

---

L. E. SAYRE AND H. V. CADWELL, UNIVERSITY OF KANSAS.

---

The sudden cessation of foreign chemical manufacture and importation from European countries, notably Germany, has caused considerable discomfort in American chemical and pharmaceutical circles, since many of the common drugs used so generally here are manufactured abroad. A conspicuous example of the rapid rise in price of these drugs was cited in the Public Health Reports.<sup>1</sup> Thymol increased from \$2.00 a pound to \$15.00 a pound in three months. Many of these drugs are found in great abundance in the common weeds of this country.<sup>2</sup> The European monopoly of the drug trade has existed chiefly on account of the better established factories there, but since the prices have advanced to the present figure, the American manufacturer can well afford to equip his factory to handle the drug trade of this country.

It was with the idea of utilizing the American stramonium for the commercial production of the valuable narcotics of the belladonna series that this analysis was undertaken.

The *Datura Stramonium* L., commonly called "Jimson Weed," it is well known, grows profusely throughout the United States, Europe and Asia. It has a varying alkaloid-content when uncultivated, which has been found to range between 0.13 percent<sup>3</sup> and 0.62 percent<sup>4</sup>, with a general average of about 0.30 percent. With cultivation the alkaloid-content is increased to a considerable degree, Miller and Meader<sup>5</sup> finding an alkaloid-content of from 0.46 percent to 0.55 percent in plants raised in Indianapolis with cultivation.

The sample of leaves for this analysis was gathered from a hog lot at Fox, Kendall County, Illinois, just after the period of the full flower. After drying in an attic they were ground to pass a 100-mesh sieve. The analysis was made according to a modification<sup>6</sup> of Dragendorff's method of plant analysis, such that the first principal steps could be carried out in a Soxhlette extractor and the succeeding determinations could be made on the one sample.

*Moisture*.—Samples of from 2 to 3 grammes were dried in a Soxhlette drying oven for six hours at 100° C. The oven was equipped so that a rapid current of air was passing through it all through the interval.

*Ash*.—The ash determinations were run on samples of about two grammes at as low a heat as possible, finishing the oxidation with the addition of a little ammonium nitrate. The ash was then extracted with water and later with dilute hydrochloric acid.

*Nitrogen*.—The nitrogen was determined by the well-known Gunning modification of the Kjeldahl method, the albuminoids being calculated by the use of the factor 6.33.

*Chloroform-Soluble Constituents.*—About five grammes of the finely powdered leaves were placed in a Soxhlett extractor, having all glass connections, and extracted for eight hours with pure chloroform. This procedure brought into solution the alkaloids, glucosides, organic acids, chlorophyll, resins, fats, waxes, camphors, fixed oils and volatile oils.

The volatile oils were determined by evaporating the extract to dryness at the lowest possible temperature, then adding about 10 cc. of water and evaporating at 100° C. The difference in weight gives the amount of volatile oils.

The fixed oils were extracted with petroleum ether and determined directly.

The alkaloids, glucosides and organic acids were then extracted with water and determined directly. Qualitative tests for alkaloid with Mayer's reagent gave a pronounced reaction and for glucoside with Fehling's solution only a slight reaction after prolonged boiling with acidulated water.

Camphors, resins and chlorophyll were determined directly by extracting with 80 percent alcohol.

A residue remained, consisting of a green, gummy mass having a strong herbaceous odor.

*Constituents Soluble in 80 Percent Alcohol.*—The residue from the chloroform extraction was again extracted in the Soxhlett extractor with 80 percent alcohol for eight hours. The extract was then dried and extracted with water and the water extract divided into three portions. One portion was precipitated with copper acetate, another with neutral lead acetate and the third with basic lead acetate. The copper acetate precipitate consisted largely of tannic acid, the neutral lead acetate of tannic acid and some coloring matter and the basic lead acetate of the coloring matter.

*Constituents Soluble in Water.*—The residue from the alcoholic extraction was macerated in cold water for two days. This procedure brought the gums and pectin bodies into solution.

*Constituents Soluble in Dilute Acid.*—The residue from the water extraction was boiled for two hours with a 10 percent solution of hydrochloric acid which brought the starches and some albuminoid matter into solution. The extract was neutralized with potassium hydroxide, which precipitated some of the albuminoid matter. The remainder of the solution was boiled with Fehling's solution to determine the percentage of starch through the reducing sugars.

*Soluble in Dilute Alkali.*—The residue from the acid extraction was boiled for two hours with a two percent potassium hydroxide solution. This solution contained albuminous matter, humus and pectic acid. Hydrochloric acid precipitated a considerable amount of this matter.

*Crude Fiber.*—The residue from the alkali treatment was oxidized with bromine water and ammonia to remove the insoluble coloring materials from the cellulose.

*Cellulose.*—The residue from the crude fiber treatment consisted of cellulose and what mineral matter that had escaped extraction in the previous processes. The amount of cellulose was then determined by burning the residue from the mineral matter. The ash left was called the residual ash in the analysis.

The resulting analysis of stramonium was:

Moisture .....	7.37%
Chloroform soluble .....	9.71%
Soluble in 80 percent alcohol.....	17.29%
Soluble in water.....	9.37%
Soluble in dilute acid.....	34.24%
Soluble in dilute alkali.....	15.84%
Crude fiber extract.....	.54%
Cellulose .....	4.64%
Residual ash .....	1.00%

Total.....	100.00%
Total ash .....	17.02%
Water soluble ash.....	58.60%
Soluble in hydrochloric acid.....	31.89%
Residue .....	9.51%

Total .....	100.00%
Nitrogen as albuminoid matter.....	6.33%
Alkaloid assay .....	.28%

Constituents of the chloroform soluble material:

Volatile oils .....	20.30%
Fixed oils .....	15.30%
Alkaloids, glucosides and organic acids.....	25.00%
Camphor, resin and chlorophyll.....	12.00%
Residue .....	27.40%

Total..... 100.00%

Constituents of the 80 percent alcohol portion:

Tannic acids ppt. by copper acetate.....	18.58%
Tannins ppt. by neutral lead acetate.....	7.40%
Coloring matter ppt. by basic lead acetate.....	33.75%
Material not examined.....	40.28%

Total..... 100.00%

Constituents of the dilute acid extracts:

Precipitated by KOH.....	21.75%
Starch .....	1.45%
Not examined .....	76.80%

Total..... 100.00%

Constituents of the dilute alkali extracts:

Precipitated by acid.....	28.43%
Not precipitated by acid .....	71.72%

Total..... 100.00%

## Editorial

E. G. EBERLE, Editor.....63 Clinton Building, Columbus, Ohio

### THE EDITORSHIP OF THE JOURNAL.

IT is in order to state that the Committee on Publication has elected the writer Editor of the Journal of the American Pharmaceutical Association, which action has been ratified by the Council. It will be recalled by the members of the Association, that, because of personal illness, Dr. James H. Beal, formerly Editor of the Journal, was compelled to relinquish his duties last summer, to take effect as of September 1, 1914, and that Mr. E. C. Marshall, (formerly Advertising Manager) was made Acting Editor until a successor to Dr. Beal could be chosen.

In accepting the honor conferred, the Editor is mindful of the responsibilities he assumes, but reposes confidence in the helpfulness of his associates, namely, that of all the members of the Association. This is the expectation that gives him courage, judging from their work of the past, which has sustained and built up our organization, also realizing that such purpose can only be to grow into greater, or at least continued, usefulness, in the advancement of pharmacy.

The readers will pardon the presentation of thoughts which are not altogether new. If the individual member of an organization is true to himself, he is true to others, and this applies to our organization, which has always stood for exalted principles, in order to serve mankind and to co-operate intelligently with the medical profession. It is unnecessary, at this time, to refer to the leading lights in pharmacy of the past, for we have equally good and true pharmacists with us now; and while we may point to them as chiefs, we are mindful that they represent constituents. Progress is made possible only by co-operating under leadership, and the application of the best thoughts of yesterday with those of today.

The greatest lack of progress, in the past, in all lines of activity, has been due to lack of co-operation, the majority giving the few too much work to do. Hence, the call that every member should recognize his full duty as a member. Quite naturally some must direct and perform the duties of office, but individual initiative and team-work are necessary for a live organization. If a larger number of members can be persuaded to take a more intensified interest in the work of the Association, then a more substantial growth will be assured. What inducement can be offered to bring this about? The Editor will welcome helpful suggestions, for his ardent desire is that his work will stimulate the growth and development of the Association and all the objects it stands for.

It has been stated that one of the objects of the Journal is to publish the papers presented at the annual meetings, but other contributions furnished during the year will not only be welcome, but are earnestly solicited.

The advertisements in the Journal are a source of revenue to the Association and may be readily augmented if the members will encourage the advertisers by their patronage, evidencing that they take cognizance of those who favor the publication. The advertiser naturally expects results from money expended for

publicity. As a matter of business, therefore, he should be convinced that our advertising medium brings returns. The members of the Association have the opportunity in their hands. Will you help?

Publicity-methods at the present time are far different from those of former years. Now, advertised goods are the dependable kind. The writer's views may differ with those of some of the members, but in his estimation, modern advertising literature is educative, and should have a prominent place in professional magazines.

The work of the Editor is largely to co-ordinate the expressed desires of the members relating to the conduct of the Journal and the Association, perhaps to offer suggestions and ideas for development. He speaks only as an individual, though his efforts are assumed to present the views of many. He can be helpful, and much depends upon the efficiency of his services, but he must have inspiration from the co-operation given him by the members. The Journal belongs to the Association, and each and every member of it shares, not only in the advantages gained from the Journal, but also, in the responsibilities of ownership. We represent a working force in pharmacy, the utility of which is dependent upon our individual efforts or neglect. All members have influence, every day's membership affects the organization for good or ill; its purposes are advanced by staunch support, retarded by inaction and injured by discord.

In assuming the duties of the office, the Editor desires to touch elbows with his fellow-members, be a good listener, and do his utmost to maintain the high standard of usefulness established by Dr. James H. Beal for the Journal, so that it may contribute to the upbuilding of the American Pharmaceutical Association, aid in enlarging its opportunities, give thought and assistance to those things which should be preserved, and advance the usefulness of pharmacy in its best estate.

I desire, in conclusion, to express my grateful and sincere thanks for the high honor conferred on me by my election, and express the hope that my work will merit your approbation. My greeting implies action; now let us work together, "one for all and all for one."

E. G. EBERLE.

#### THE EDUCATION OF THE MODERN PHARMACY STUDENT.

THE difficulties that obtain in the teaching of pharmacy students are accentuated by the changing character of the drug business. The business has developed both along professional and commercial lines and doubtless this will continue. Those who are desirous for purely professional pharmacies, in this country, look in vain for indicative signs to encourage them; everyone must admit that the trading element in pharmacy is becoming more ostentatious, year by year. Whether we lament or rejoice, we must recognize conditions.

So far as definite records go, the apothecary kept open shop—inviting patrons, not only to have medicines prepared, but also to make purchase of perfume, spice and whatever articles that were seemingly compatible with the drug stock of the times. At the present, the so-called side-lines have an important place in every store, whether the owner is a studious pharmacist or stresses the importance of increasing the volume of sales. The complement to conducting a store is selling

something, hence merchandizing in a drug store is a sequence; the pharmacist renders professional service.

The object of these introductory remarks is not to discuss whether a pharmacist should be a tradesman or not, but to present an aspect of the inherent conditions of the drug business with the view of developing a line of thought relative to the chosen subject.

The apprentice system is no longer in vogue and most of the young men find employment in a drug store without the expectancy of continuing therein. They do not choose to follow pharmacy as a profession, but simply as a means of earning money, and continuing for several years, they realize that in order to receive more wages, they must qualify as pharmacists and thereafter attend a school of pharmacy. In reality they have not selected their vocation—they have grown up to it, fallen into it by accident, been thrust into it by others, or by the pressure of need. Here is the difficulty that is presented for the proper training and education of pharmacists, and here also we have the young men who will shape the pharmacy of a later day.

This is not said in any carping spirit, nor as suggesting that the pharmacists of this country are less efficient than those of Europe, but simply to point out that these young men can be directed in the course which will develop pharmacy along lines we have in contemplation. Are we satisfied with conditions as they exist, or not? Bend the twig accordingly.

The revolutionary changes from hand to machine work have affected pharmacy, so have also the exclusion of many medicinal preparations, the introduction of manufactured remedial agents and the decreased prescription of medicines, all of which have developed the need of vocational training to match these changes. And in the absence of such preparation, the drug business has been unduly commercially developed.

Educators in pharmacy must become expert students of conditions as they actually exist, not continue to follow a syllabus that conformed to the conditions of pharmacy twenty-five years ago. They must be students in the science and art of pharmacy, and they must also be students of life, of progress, of conditions, whether this conforms to their ideals or not. They must, if possible, point out the way to success in the vocation for which they prepare the students in their charge.

While the custom of teaching by subjects must be retained, their relative values should be determined and co-ordinated—with direction to the one grand object of practical application. An education in pharmacy means not only the assimilation of the essential knowledge in order to properly apply it, but also, a wide acquaintance with the possibilities of pharmacy. The kind of learning pharmacists usually need is that which enables them to fight for a living. Every avenue that may be opened to the student of pharmacy, should be pointed out to him, so that if desirable, he may specialize, or add a line of related work that will bring him remuneration and reflect credit. The wonderful development in motion pictures suggests the possibilities of bringing the activities of manufacturing industries to the attention of the students. By this means, also, the life and growth of plants may better be shown than explained, and in connection with the drug gar-

dens that are being established, will contribute much lasting and available knowledge.

In later years educational methods have been shifting toward the sympathetic understanding of the *individual* and building up of the inner life. The same progressive thought must obtain in educating and creating pharmacists; whatever we desire them to be, is one of our problems. Life is largely what we make it, and so with our activities, although they are influenced by environments. We must come to a more definite understanding regarding this important matter, so that there shall be better and more constructive work.

The higher entrance requirements in schools of pharmacy are said to have reduced the number of available pharmacists and increased their wage, thus reducing the net profit derivable from conducting a drug business. There are other economic conditions, also, which have made the business of the small dealers less remunerative. All of this must be admitted, but nevertheless, we must have some fixed ideas by which the progress of pharmacy must be directed, or it will be built-up like the house to which additions are made, without regard for symmetry. This was at least one of the reasons for the construction of the Pharmaceutical Syllabus. A lack of understanding as to what should really be required is evidenced at times by Board of Pharmacy questions. Those of the several branches should be synthetical and have as a purpose, the analysis of the qualifications of the candidates.

The idea that the public school system is a sort of procrustean bed to which all children must be fitted without regard to individual differences, is being displaced by the more rational and progressive one of looking forward to the adaptation of the pupil for life's activities. In the furtherance of such plans, pupils should have an opportunity of knowing what the service in pharmacy means and what it requires. This will enable them to have a voice in the choosing of their vocation; an occupation, if distasteful, dooms the individual to a life of discouragement and disappointment, while if the votary loves his work, it will not only mould his character, and develop his ability, but will help in shaping the destiny of his chosen profession.

E. G. EBERLE.

#### THE SAN FRANCISCO MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

THE time for the next annual convention of the American Pharmaceutical Association is rapidly approaching and the chairmen of the various sections are arranging their programs. Papers should be in their hands somewhat earlier than usual, as some members contemplate visiting the Exposition before the meeting and making side trips on their return journey.

Chairman H. P. Hynson, with whom are associated Messrs. F. H. Freericks, Joseph L. Lemberger, W. C. Anderson and F. M. Apple, were appointed on a committee "to investigate the House of Delegates and see if its usefulness could not be improved." A letter has been issued and was printed in the April number of the Journal, setting forth in a general way the value of this body, not only to the American Pharmaceutical Association, but to State and other organizations,

and we invite your careful consideration and afterward your suggestions, to be communicated to Chairman Hynson.

With all the possibilities of the American Pharmaceutical Association nothing will be accomplished unless the members co-operate. This is the secret of all success in association work; the conventions are always enjoyable, but not the main object. An important change has been made this year by convening the American Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy during the latter part of the week, preceding the annual meeting of the American Pharmaceutical Association.

We hope to have a list of all committees in the present number. From now until the meeting every possible effort should be put forth to increase our membership, one new application from each member would double the strength of the Association for doing good. Will you not resolve that your name be attached to one application before the next issue?

It is hardly necessary to say much of the trip involved in going to San Francisco, the opportunities for education and enjoyment are only circumscribed by the contents of your purse. The readers have doubtless informed themselves regarding the Exposition and therefore comment is needless; suffice it to say, San Francisco has made good her promises. The druggists of California anticipate entertaining the largest number ever in attendance at a convention of the American Pharmaceutical Association. Prepare for a profitable meeting, an enjoyable occasion, and the greatest sight-seeing tour of your life. E. G. EBERLE.

The Hotel Bellevue has been selected as headquarters for the San Francisco meeting.

#### PHARMACY AND THE PUBLIC.

THE newspapers often take a fling at pharmacists and included statements go by unchallenged. As a result the public has an entire misconception of the services rendered by pharmacists to humanity. On the other hand, we are neglectful in not seeking to obtain full credit, when the work of pharmacists is reported in the daily press. At the present time, pharmacy is really a great factor in many industrial lines.

The Journal of Industrial and Engineering Chemistry for April, 1915, in an editorial, makes it very plain that the public has not been informed relative to the vast and varied field of professional activity of the chemist, even ascribing the public sources of relative information to the signs displayed on the corner drug stores. The writer recites that chemists have received less public acknowledgment than the workers of any other profession and recognizes the publicity which has been given recently to the coal-tar dye industries and the public acknowledgment of the chemists' responsible connection with this important industry, as a great accomplishment.

That the editor is well pleased with the publicity given is clearly evident when he states that "it matters little whether the chemical profession comes into view riding the spectacular coal-tar hobby, whether it is 'trimmed' by the public press for its lack of initiative in seizing opportunities, or whether it is charged with an

utter absence of business acumen, so long as it comes to be publicly recognized as an important and as an essential factor in the industrial development and councils of this country."

We abstract further, "if the newspapers make mistakes in discussing our intricate scientific and industrial problems, we should not be content to blink and chuckle in our superior wisdom, but should come out in the open and set them right. If legislative styles point unmistakably to pension log-rolling, bureaucratic log-rolling, tariff log-rolling, it is our duty to teach legislators the value of rolling the logs that will develop the industries which support our profession."

We have thus quoted at length, because what is stated in that editorial might easily be shaped and made applicable to pharmaceutical activities, and also because of the very close existing relations, or perhaps better, because their industries are mutually dependent.

There is need for closer co-operation between industry, science and finance in the United States. When industry and science do not work together, industry is often handicapped by out-of-date and wasteful processes, conversely science has not the opportunity for research. German success must largely be ascribed to a more general and efficient organization supported by a superior educational system; their boast having been that within ten years there would be no such thing in the German Empire as an untrained workman, from the chimney sweep to the high-grade artisan. Liebig, Woehler, etc., founded schools which were later subsidized by Germany and brought into co-operation with her chemical industries.

We must adopt some of the German methods, if we desire to take advantage of the opportunities now before us; there must be co-operation between science, industry and finance. Financiers will profit by promoting industries; the latter will be made more productive through research work in the schools and laboratories; contact with the industries will stimulate the students, pointing out to them leads for research subjects, and professors will be turned from their accustomed system of teaching to methods that will be more practical, even though not as pleasingly ideal.

E. G. EBERLE.

#### STATE ASSOCIATION MEETINGS.

THE American Pharmaceutical Association extends to all State Associations its best wishes for successful and profitable meetings.

During the past year much has transpired that has affected the drug business adversely, more particularly through the unsettled conditions of the market, influenced by the war in Europe. To such an extent was the commerce of the United States involved that it became necessary to impose a stamp tax, and as usual many articles sold by druggists were designated as a source for such revenue.

Later the Harrison bill was enacted and again druggists were troubled for a time, feeling that a misinterpretation of the law might bring them trouble. Thus far the Revenue Department has given every aid possible and shown fairness. There have been a number of convictions, but these seem to have been deserved. What the inspectors will do, when there have been unintentional violations, remains to be seen. From the very fact that druggists labored for this law and as

a class have signified obedience, it would seem that fair and proper consideration should be given them.

In many states the legislatures have failed to enact laws complying with the National Act. In this issue will be printed a bill prepared by Messrs. J. H. Beal, F. H. Freericks and Hugh Craig, at the request of the National Association of Retail Druggists. This committee is desirous of having comment thereon from State Associations and they will present the same for discussion at the meeting of the American Pharmaceutical Association in San Francisco. In our opinion the committee has been eminently successful in the construction of the bill and your endorsement after careful consideration is expected.

It is hoped that the various State Associations will express their opinion anent the possibilities of the House of Delegates of the A. Ph. A., in bringing about a closer relation with the parent organization. Each state is entitled to a representation of three delegates from their association, and such selection should not be overlooked.

We may congratulate ourselves that there are evidences of returning prosperity. Our greatly increased exports have, in the first nine months of the Government's fiscal year, produced a favorable trade balance of 700 million dollars. If such a condition existed at any other time than during the present European war, it would bring about an unprecedented boom to business.

In again wishing to each association large and successful meetings, an invitation is extended to all their membership to meet with the American Pharmaceutical Association in San Francisco, during the week of August 9-14, 1915.

E. G. E.

### THE MODEL STATE NARCOTIC LAW.

**I**N this issue under "The Pharmacist and the Law" we have printed in full a bill prepared by Messrs. J. H. Beal, F. H. Freericks and Hugh Craig for a Model State Narcotic Law. The work was done at the request of the National Association of Retail Druggists and is deserving of thankful recognition by pharmacists throughout the United States.

There may be a difference of opinion as to whether a State law is necessary, complying with that enacted by Congress. This has nothing whatever to do with the duty that was assigned the committee and which they so conscientiously and efficiently performed. The bill, in our opinion, is a most complete and satisfactory draft and avoids adding even the least additional burden upon the several branches of the legitimate drug trade.

We invite a careful reading of the bill and if members have suggestions to offer, they will be welcomed by the Chairman of the Section on Education and Legislation, where discussion of the bill has a place on the program.

If a State provision is necessary, then compliance with the Harrison law is essential so as not to subject druggists to further burdens. It should be emphasized that the work of the Committee is deserving of unstinted praise for the efficient manner it was performed, and every encouragement should be extended to accomplish the purpose of the request made of them. Let us never be derelict in acknowledging services faithfully performed.

E. G. EEBERLE.

SOME OBSERVATIONS ON THE BRITISH PHARMACOPŒIA, 1914.\*  
(Fifth Revision.)

---

IRWIN A. BECKER, MICHAEL REESE HOSPITAL.

---

To learn the purposes of and the reasons for any book, one consults its preface, as it is here authors "state their case." By doing so, one avoids making undeserved and ill-considered criticisms.

In this instance, careful reading of the preface is quite essential for the proper understanding of the subject. Here one will find that certain deviations are permitted, and inclusions made, to broaden the scope of the book to better serve the whole empire.

The "histological characters of the parts of plants officially recognized are fully described whenever the information is important;" so also of drug powders, where "by chemical testing alone the identity of the article in question could not be certainly determined."

Thus omitting non-essential or the more technical details wherever it was deemed permissible. "Words in the text" referring to articles, reagents, and processes defined or described in an appendix, are printed in italics, thus emphasizing their importance and facilitating reference.

We are informed that "the English titles are not, as a rule, literal translations of the Latin titles." Again that the list of abbreviations in the index, in the interest of international uniformity, is in response to a suggestion of Dr. Remington, chairman of the U. S. P. convention, and that the list probably will be found useful to those in foreign countries, who have to interpret the abbreviations of British practitioners.

Because the  $\bar{\text{S}}$  symbol is used to represent 60 grains as well as one fluid drachm, and the  $\text{S}$  symbol is used to represent sometimes 480 grains, sometimes 437.5 grains, as well as one fluid ounce, and are liable to be misread, "it is recommended that prescribers should cease to employ them."

Other features are the use of the centigrade thermometric scale, and metric weights and measures only, in stating temperature and quantities.

Doses are stated in both the metric and the imperial systems, with only approximate equivalence intended. The term millilitre is used instead of cubic centimetre, being shorter, and in better conformity with the metric notation.

In stating doses of fluids, the contraction "mil," and its compounds "decimil" and "centimil" are used—a decided improvement on our present method.

For "metric measures" and "volumetric vessels" the standard temperature is 15.5° C. (60° F.), however, for purposes for which the imperial system is used, vessels are "recognized" which have been graduated at 16.7° C. (62° F.).

The terms "water-bath" and "steam-bath" are specifically defined.

The atomic weights adopted are the 1914 values of the International Committee on Atomic Weights, on the basis of Oxygen = 16.

In quantitative testing, proportional amounts of those stated, are permitted.

---

\* Read before Chicago Branch, April 27, 1915.

The last sentence of this paragraph seems like an official recognition of professionalism in British pharmacy, and a compliment to British pharmacists, and reads as follows:

"In short, the details of procedure in these and other chemical operations are now left to the skill and judgment of pharmacists and of analysts who are assumed to be fully trained."

Considering the several monographs, the grouping of the various reactions and tests, and the descriptions of general processes in the appendix has resulted in a great saving of space, producing a smaller book than the present U. S. P.

The simple and direct manner of statement adds definiteness and brevity, for example, Hydrochloric Acid is defined as "a liquid containing 31.79 percent, by weight, of hydrogen chloride, HCl, and 68.21 percent, by weight, of water. And under "Characters and Tests" we find: "Lead limit 10 parts per million. Arsenic limit 5 parts per million." Both statements short and to the point.

"Alumen Purificatum," may be either potassium or ammonia alum. "Amylum" includes corn, rice, and wheat starch.

Under "Acidum Acetylsalicylicum" the test for absence of salicylic acid reads as follows: "When 0.5 gramme is shaken with 20 millilitres of water and 1 drop of T. solution of ferric chloride is added, no violet coloration is produced." Prolonged shaking may sufficiently decompose a sample to give a positive reaction; also allowing the test to stand several hours gives a positive result, thus showing the need of time-limits on certain procedures and tests.

Under "Apomorphinæ Hydrochloridum" the following warning serves the busy pharmacist well: "The solutions decompose on boiling or keeping, with production of a green colour; but remain unchanged for a considerable time if acidified with a trace of hydrochloric acid."

There is a lack of uniformity in the titles of the bismuth salts: "Bismuthi Carbonas" is Bismuth Oxycarbonate, synonym B. subcarbonate; "Bismuthi Salicylas" is B. salicylate, and in the definition named oxysalicylate; "Bismuthi Subnitrates" is B. oxynitrate, without the synonym "Subnitrate." Chemical formulas are provided for these salts, thereby suggesting definite and uniform composition, which, however, will not likely be the case.

Cantharidin and its preparations replace Cantharides and preparations, assuring more certain medication.

Infusion Digitalis contains only 7 gm. drug per litre, less than half the U. S. P. strength. Hypodermic injection solutions of few drugs are provided. These are prone to fungus growths, and the use of tablets affords, more readily a closer approach to asepsis.

Formulas for several ophthalmic discs are included.

"Liquor Ammonia Fortis" is 32.5 percent by weight, of  $\text{NH}_3$ , 28 percent being the U. S. P. strength.

The ammonia waters, lime water, witch hazel, and hydrogen peroxide are classed as liquors. "Liquor Cresolis Saponatus" is made with castor oil.

"Oleum Phosphoratum" differs slightly from the N. F. preparation.

"Opium" contains somewhat less morphine than the U. S. P. standard requires.

A number of inclusions and omissions may seem odd to us: Codeine alkaloid and phosphate are included, the sulphate omitted; morphine acetate, hydro-

chloride and tartrate included, the alkaloid and sulphate omitted; strychnine alkaloid and hydrochloride included, the nitrate and sulphate omitted; quinine alkaloid is omitted; pilocarpine nitrate only is official; "Potassa Caustica," potassium hydroxide, is included, sodium hydroxide omitted.

"Sodium Acid Phosphate" is a valuable inclusion.

"Spiritus Rectificatus," alcohol, is 90 percent by volume—the U. S. P. alcohol being 94.9 percent.

There are four diluted alcohols official, namely, 70, 60, 45, and 20 percent, respectively.

"Tinctura Iodi Fortis" is 10 percent, "Tinctura Iodi Mitis" is 2.5 percent. "Unguentum Hydrargyri" contains 30 percent mercury, conforming in strength to the International Agreement. "Unguentum Hydrargyri Ammoniaci" is 5 percent, a more commonly used strength. There are 43 ointments in the B. P., the U. S. P. containing only 24. "Benzoinated Suet" replaces benzoinated lard for ointments made in India.

There is a tendency of having opium in disguise in a number of preparations, examples of which are: "Compound Pill of Soap," "Compound Powder of Ipecacuanha"—"Dover's Powder," "Compound Powder of Kino," "Compound Lead Suppositories," and "Compound Tincture of Camphor"—Paregoric.

A number of "coined" names are among the official titles, such as "Barbitone" for diethylbarbituric acid—Veronal, "Benzamine Lactate" for beta-eucaine lactate, "Diamorphine Hydrochloride" for di-acetyl morphine hydrochloride, "Hexamine" for hexamethylenetetramine, "Phenacetinum" for para-acet-phenetidin, "Salol" for phenyl salicylate, "Sulphonal" for diethylsulphone-dimethyl-methane, "Methylsulphonal" for diethyl-sulphone-methyl-ethyl-methane.

Some of these names are new, others familiar; taken as a whole, perhaps better than former attempts.

There is a stated limit of error for Alkaloidal Assays, within which preparations must be brought in their final adjustment.

These are some of the things noted in a more or less careful inspection of the book, with a very limited working knowledge of the formulas.

## A PLAN FOR A MORE SERVICEABLE A. PH. A. JOURNAL.\*

R. P. FISCHER, B. S., PHAR. D.

It has been apparent to many members of the American Pharmaceutical Association for some time that the "Journal" of the Association is not giving as satisfactory service as might have been expected, judging by the contentions of those who advocated discontinuing the issuance of a volume of annual proceedings and substituting therefor a monthly journal. In the editorial outlining the policy of the "Journal" published in the first issue of the latter it was stated that it had been brought "into existence to serve the necessities of the Association," and that, "except for its ability to render this service in more complete manner

\* Read before New York Branch, A. Ph. A., March 8, 1915.

and form than can be rendered by other existing agencies, the 'Journal' has no excuse for being."

The purpose of this paper is not to adversely criticise the past or present management of the "Journal," but rather to outline a plan by which it can be made to serve the members of the Association with greater satisfaction.

One must realize that the problem of presenting the entire proceedings of the Association and its local branches, together with the great volume of literature brought before the meetings of these bodies, in twelve monthly installments, is no easy task. But the present limitations of the "Journal" make it an inferior representative of the scope and activities of the American Pharmaceutical Association.

Modern journalism of any type demands that news be presented to the reading public as concisely and expeditiously and yet as fully as possible. Members of the American Pharmaceutical Association who present papers at its meetings or at meetings of its local branches are not permitted, according to the by-laws, to publish these papers elsewhere until they have appeared in the Association's Journal. Such a requirement would be just, if the papers were published within two, three or even six months of the date of presentation, but when a member presents a paper at one meeting of the Association and fails to see it printed in the "Journal" until a full year has elapsed, "it will possess value for only one division of the Association, namely the Section on Historical Pharmacy," and it is questionable whether a member will think it worth his while to contribute future papers of any importance to the Association. Only a very small percentage of the members are in a position to attend the annual meetings and besides, there is never sufficient time to read all of the papers presented, so it is really through the publication that members expect to bring their views before the pharmaceutical public.

It should be the function of the "Journal" to serve the members of the American Pharmaceutical Association in such a way as to at least compare favorably with the publicity obtainable through the balance of the pharmaceutical press.

The proceedings of a convention should be chronicled, as far as possible, in one issue of the "Journal" in order to be of interest to the non-convention-goer.

Few people care a great deal for serial stories spread over a half dozen or more issues of a magazine, and members of the American Pharmaceutical Association are not exceptional in this respect. How many, then, are interested enough to read the entire proceedings of a meeting of the Association when the report of the first session may appear in September and reports of succeeding sessions are not published for two, three or four months following.

Under the present plan the contents of the "Journal" include editorials, proceedings of the general sessions of the Association, council business, legal problems, news items of general interest and the papers presented to the meetings of the sections and branches of the organization, together with their discussion.

The editor is confronted with the rather difficult problem of giving each of these topics sufficient space to properly present it and at the same time make the "Journal" the official record of the proceedings of the Association. Is it any wonder then that some one's paper must be deferred for a year before it can be published and that the proceedings of the annual meeting must be spread over

several issues? There is no fault to be found with the editing, but why should an Association like the American Pharmaceutical Association have such poor publicity facilities? The American Medical Association has found it necessary to make its publication a "weekly" and even then there seems to be no space to spare.

While the American Pharmaceutical Association is big enough, in every sense of the word, to support a weekly journal, it would perhaps seem like too great a leap to take at once, to urge a weekly publication at present.

Conditions are such, however, that one need not hesitate to strongly advocate a semi-monthly publication of the "Journal." If we had two issues each month, the material available could be presented in a manner somewhat as follows: Assuming that the dates of publication would be the first and fifteenth of each month, the issue appearing on the first of each month could contain the editorials, selected articles, local branch, and general news, legal items and reports of council business.

The issue appearing on the fifteenth of each month could then be devoted exclusively to the proceedings of meetings, to the publication of the papers presented at the meetings of the Association and its local branches with discussions, contributed articles, and such special features of scientific or general pharmaceutical interest which the editor and the publication committee may deem worth publishing in this number.

If the annual meeting of the Association were held in August, and this plan be followed, the issue of September 15th could contain a full record of the proceedings of the entire meeting, without the papers and their discussion, of course. The segregation of the minutes and proceedings of the annual meeting in one issue for reference would be welcomed by many, even though they attended the meeting.

The issue of October 15th could contain the papers and proceedings of the scientific section; that of November 15th, the papers and proceedings of the commercial section; that of December 15th, the papers and proceedings of the dispensing section; that of January 15th, the papers and proceedings of the historical section; that of February 15th the papers and proceedings of the educational and legislative sections, and so within six months one would have a complete collection of the papers presented at the annual meeting as well as the proceedings of the meeting. Perhaps it would take seven months, if the number of papers is unusually large, or again it might take only four or five months if the number of papers read is below the average. All of this, would, of course, be subject to conditions.

The papers presented to local branches and contributed articles, as well as pre-convention matters would keep this "15th of the month number" well supplied with material until the time of the next meeting when the same program could be repeated.

I realize that this is merely an outline and does not present all of the possibilities of a semi-monthly American Pharmaceutical Association Journal in detail, but I believe that if such a plan were followed it would be a distinct advantage to the Association, both from a revenue-yielding point of view, through increased advertising, and from the point of view of service to the members.

The semi-monthly issues could, of course, be gotten up in the same style as the monthly journal is appearing at present.

The plan outlined above has the advantage of enabling those who keep their copies of the "Journal" for reference, to have all of the papers presented to the Association and its branches consecutively arranged and classified under the various sections, by annually binding the issues appearing on the fifteenth of each month, in their numerical order.

If the news matters, editorials, etc., are to be kept, and it is certainly desirable for pharmaceutical workers that they should be, the issues appearing on the first of the month could also be bound in a separate volume.

Thus in the second instance one would have a volume recording a year's American Pharmaceutical Association news and in the first instance one would have a volume resembling the old "proceedings" of the Association, whose loss continues to be felt by pharmaceutical workers.

---

### COMPARISON OF AMERICAN AND EUROPEAN SPRINGS.\*

Research of the Department of Balneology of the College of Jersey City.

---

DR. FELIX VON OEFELE.

---

During the European war it is impossible or at least inconvenient to send patients to European mineral spring resorts. Therefore our Balneological Department herewith furnishes the following alphabetical list of well known European springs which can be replaced by American springs. The comparison is based on physical, chemical and physiological properties. This list is only preliminary, and it will be continuously supplemented and corrected in our files, if a reason becomes evident. More complete analyses of American springs are soon expected and for these different reasons a Department of Balneology has been instituted at the College of Jersey City.

Aachen—San Luis, California.

Abbach—Santa Rosa, White Sulphur Springs, California.

Abbazia—Atlantic City, N. J.

Adelheidsquelle—Americus Mineral Well, Michigan.

Aix les Bains—Arrow Head Hot Springs.

Amelie les Bains—Clifton Springs, N. Y.

Antogast—Schooley Mountain Springs, New Jersey.

Apenta—Pluto, French Lick, Indiana.

Appollinaris—Arrington Mineral Springs, Kansas.

Assmannshausen—Lebanon Springs, New York.

Baden-Baden—Jemez Hot Springs, New Mexico.

Baden (Switzerland)—San Diego de los Banos, Cuba.

Baden (Austria)—San Diego de los Banos, Cuba.

Badenweiler—Las Vegas Hot Springs, New Mexico.

Bath (England)—Allegheny Spring, Pa.

Boklet—White Sulphur Springs, Sullivan County, New York.

Brueckenau—Adirondack Mineral Springs, New York.

---

Copyrighted 1915 by the College of Jersey City. Permission granted to reprint.

\* It was deemed that the information given would be of special interest at this time.

- Cudowa—Different Springs of Genesee County, New York.  
 Driburg—Schooley Mountain Springs, New Jersey.  
 Eilsen, Sharon Springs, N. Y.  
 Elster—Saratoga Springs, N. Y.  
 Ems—Des Chutes Hot Springs, Oregon.  
 Flinsberg (Schlesien)—Napa Soda Springs, California.

## THE PRESCRIPTION OF LIFE.\*

---

J. W. ENGLAND.

---

Aunt 'Liza's former mistress was talking to her one morning, when suddenly she discovered a little pickaninny standing shyly behind his mother's skirts.

"Is this your little boy, Aunt 'Liza?" she asked.

"Yes, miss, dat's Prescription."

"Goodness, what a funny name, aunty, for a child! How in the world did you happen to call him that?"

"Ah simply calls him dat becuz Ah has sech bahd wuk gettin' him filled!"

Life is a funny proposition. It's just like the model prescription described by Joseph P. Remington in his model textbook on "Pharmacy." It may be compatible or incompatible, palatable or unpalatable, bitter, sour or sweet.

It may do good or harm. It may bring joy to the heart of the sick or ease the pain of the dying. It all depends upon the skill with which it is prescribed and compounded.

The prescription has six parts and so has life:

1. We have the "Superscription or heading." In the prescription, this consist of the symbol **R**, which is an abbreviation of the word recipe, meaning to "take," the imperative of the Latin verb recipio. The use of the inclined stroke on the tail of the R is traced to a custom in the ancient days of superstition, of

---

\* From address to School of Pharmacy, Temple University, at the Smith, Kline & French Co. Laboratory, April 14, 1915.

placing at the top of the prescription an abbreviation or invocation, which represents a prayer to the favorite deity.

In life, the symbol stands for ourselves and we "take" all we can get, from infancy to old age, and constantly invoke the gods for more! Man comes into this world without his consent and he goes out the same way. When a baby, everybody wants to kiss him, and before he goes everybody—don't! "In his infancy he is an angel; in his boyhood he is a devil; in his manhood he is everything from a lizard up; in his dotage he is a fool!"

2. We have "the name of the patient." In the prescription, this is directed to be placed at the head of the prescription and transferred to the label. It is frequently omitted.

In life, we are labelled with a name as soon as we are born, and hang onto it like "grim death to a dead negro," unless we happen to be a "she," when we gladly change it, on request, for another name, sixteen or more years later.

3. We have "the inscription or the names and quantities of the ingredients." In the prescription, this is the most important part of all and requires the greatest amount of care in compounding. It embraces:

a. "The basis or chief active ingredient." The basic ingredient of life is character or moral excellence. Not what the world thinks a man is, but what he is; not what a man has been, but what he may become. With character, a man can fight down all the storms of life unafraid and undismayed, and he can go down to death, if needs be, with a smile on his lips and immortality in his eyes. Without character, he is a rudderless ship, bound to the land of nowhere. And we can train character, just as we can train flowers to become more and more beautiful.

b. "The adjuvant or aid to the basis, to assist its action." In life, the adjuvant is the just appreciation of "the value of time, the need of perseverance, the pleasure of work, the dignity of simplicity, the power of kindness, the influence of example, the obligation to duty, the wisdom of economy, the virtue of patience, the improvement of talent, and the joy of originating."

c. "The corrective, which is intended to qualify the action of the basis and adjuvant." In life, the corrective is rational optimism or a cheerful disposition—looking on the bright side of life and yet appreciating its cheerful disposition—looking on the bright side of life and yet appreciating its serious note. Thinking the best of your fellowmen and not the worst. Full of good cheer and yet responsive to sorrow. Looking upward, and not downward, forward and not backward, and lending a hand—and a smile, "pro re nata."

d. "The vehicle, the ingredient which serves to "carry all" or hold together, dilute them, and give to the whole, the proper consistence, form and color." In life, the "vehicle" is a man's daily work. In its prosecution, he has to use basis, adjuvant and corrective, and as he uses them, "secundum artem," so is the measure of his success.

4. We have "the subscription or directions to the compounder." In life, every man is the architect of his own fortune, and he must frame and follow his own directions. It is a case of "misce et fiat mistura."

5. Then we have "the signa (mark) or directions for the patient." In life, this is the service a man renders his fellowmen.

6. Finally, we have "the names or initials of the physician with the date." In life, the Great Physician orders, and the date is from birth to death—three score and ten years, perhaps a little longer—and then "finis," the prescription of life is completed.

What the end-result will be, in any individual case, no man knoweth, because no one has ever returned from the Great Beyond to tell us. But with faith and courage and cheerfulness, coupled with the best thought of which we are capable, let us compound our prescription of life according to the "talents" given us, so that it shall be of lasting credit to ourselves, our profession and our Alma Mater.

---

## IODINE OINTMENT—DATA AND METHOD OF ASSAY.

---

LEO H. FRIED, PH. G., PHAR. D.

---

Before explaining the method of assay, let us first consider the absorption of iodine by benzoinated lard. The free iodine in the ointment is readily absorbed by the lard, even though potassium iodide and glycerin are present to retard this. The figures which I have computed by various experiments will readily show this.

A. N. D. Pullen explains in "The Pharmaceutical Journal and Pharmacist," November 16, 1912, page 610, that if no glycerin or potassium iodide were present in the ointment there would only be one twentieth of iodine in the free state within a few hours. He also claims that in the presence of glycerin and potassium iodide the absorption is attenuated, so that after a lapse of four months there still is 2.92 percent of the original 4 percent in free state. However, I find in my experiments that within a period of ten days there is 1.16 percent of iodine absorbed, leaving 2.84 percent free iodine. This ointment which I experimented with was kept at ordinary room temperature on a shelf, so that the changes of temperature was that of any ordinary room. On examining this ointment ninety days later, I found that only a trace of absorption had taken place. After a period of eight months from the date of compounding, no more iodine was absorbed.

### METHOD OF ASSAY.

I first made up one hundred grammes of iodine ointment according to the U. S. P. VIII, page 494, as follows:

Iodine .....	4 gms.
Potassium Iodide .....	4 gms.
Glycerin .....	12 gms.
Benzoinated Lard .....	80 gms.

---

100 gms.

### ASSAY FOR FREE IODINE.

Carefully clean, dry and tare 120 cc. Erlenmeyer glass stoppered flask and accurately weigh into it from 3.0 to 5.0 gms. of ointment, using a glass rod for the transfer of same. Add 30 cc. chloroform, shake the flask a few minutes until the ointment is apparently dissolved. Then add 30 cc. of distilled water and shake (this will dissolve the potassium iodide and glycerin which did not go into the chloroformic solution). Immediately, titrate the solution with N/10 sodium thiosulphate, shaking the flask well after every addition until a light yellow color

still remains, and add about 1 cc. cold starch T. S., and continue titration until the blue color of starch iodide disappears after vigorous shaking and does not return in one minute.

I specifically mention that the titration should be immediately performed so that the chloroformic solution will not aid in the absorption of iodine by the lard

CALCULATION.

$$\frac{\text{No. of cc. used} \times \text{factor} \times 100}{\text{Weight of sample}} = \text{percent of free Iodine}$$

*On assaying as above I have the following figures of free iodine:*

Immediately after making.....	3.89%
One hour " " .....	3.51%
One day " " .....	3.48%
Five days " " .....	3.06%
Ten " " " .....	2.84%
Thirty " " " .....	2.81%
Ninety " " " .....	2.8096%
Eight months " " .....	2.8093%

By these figures we see that the absorption goes on slowly until the maximum amount is absorbed.

ASSAY FOR POTASSIUM IODIDE.

Accurately weigh about 5 gms. of ointment into an ordinary 250 cc. Erlenmeyer flask and attach to a distillation apparatus, using as a receiver a 250 cc. glass stoppered Erlenmeyer flask, containing one gm. potassium iodide dissolved in 30 cc. distilled water and add to it 30 cc. of chloroform. Allow the end of the condenser tube to dip into this mixture. Make all connections air-tight, using rubber stoppers and not cork. Mix 5 cc. sulphuric acid with 150 cc. of distilled water, add the acid mixture quickly into the flask. Drop in a few pieces of pumice stone which have previously been heated to redness and dropped into cold water. Finally drop in a piece of ferric alum, about 5 gm. Place upon a wire gauze and apply direct flame very slowly at first, until the purple vapors of iodine have all distilled over. The iodine will sometimes condense in the tube and not go down into the receiving flask; if this happens move the flame and allow the liquid in the flask to suck up into the tube, whence it will dissolve the iodine. Replace the flame and continue distillation until an oily substance comes over. Discontinue the distillation by first removing the tube from the liquid in the receiving flask. Then take away the flame. Wash out the condenser tube and end with about 20 cc. distilled water. Immediately titrate the distillate with N 10 sodium thiosulphate, shaking the flask vigorously after every addition. Note the number of cc. of N. S. used, and calculate total iodine liberated.

CALCULATION.

$$\frac{\text{No. of cc. used} \times \text{factor} \times 100}{\text{Weight of sample}} = \text{percent total Iodine}$$

$$\text{Total Iodine less Free Iodine equals Iodine from KI}$$

Iodine	Potassium Iodide	:	:	Iodine	:	Potassium Iodide
125.9	161.76	:	:	from KI	:	X
= percent KI						

I will admit that this distillation process is not the speediest way of obtaining the percentage of potassium iodide in the ointment, but I can say that it is the most accurate. I have tried other processes such as, washing out the potassium

iodide by means of hot water, also using oxidizing agents such as ferric chloride, sodium nitrite, potassium permanganate, manganese dioxide, etc., to liberate iodine from the potassium iodide, and find that liberation is either incomplete or else the oxidizing agents interfere with the final titration. By the above method given, I got an average of 3.91 percent of KI from four titrations.

In conclusion, while this does not directly belong to the assay, I might state that from a therapeutical standpoint, many physicians I have spoken to on the subject, seem to prefer an ointment that is not freshly prepared as required by the U. S. P., but claim that an older ointment has the same effect with milder action.

### MAGNESIUM PHOSPHATE IN POPPY CAPSULES.

---

J. E. KIMLEL, PH. C.

---

Whether or not the knowledge of the existence of magnesium phosphate in poppy capsules is new, the writer is unable to state. The literature, so far as investigated, makes no mention of it.

Since the existence of the anti-narcotic law, preparations of poppy heads will undoubtedly receive more attention from the chemist.

Morphine is the important constituent and varies, according to King, from 1 to 2 percent.

To the busy chemist with little time for research, the U. S. P. method for determination of morphine in opium preparations will probably be applied, which may lead to very serious error in the final result.

Magnesium phosphate being slightly soluble in the hydro or hydro-alcoholic menstruum used, is extracted from the ground capsules and remains in the finished product.

In the course of assay, using the fluidextract for example, the extract is concentrated, ether and alcohol added and ammonia water to liberate the morphine. The whole is then vigorously shaken and set aside to allow the morphine to crystallize.

The magnesium phosphate originally present in the capsules and again in the fluidextract is by this process converted into insoluble ammonium-magnesium phosphate, which crystallizes out along with the morphine, providing enough ammonia water has been added to render the whole alkaline, otherwise no morphine will be found in the residue.

The ammonium magnesium phosphate resembles minute crystals of morphine and with a little washing is rendered bright and clean, still retaining a yellowish color, imparted by the mother liquor.

If now the residue is weighed and calculated as morphine, without further purification, as is sometimes done in the assay of opium (the writer is not discussing the propriety of such an omission) the analyst's report will not show the correct morphine content.

From this it can easily be seen that any method for the determination of morphine in poppy capsules that depends upon the crystallization of the morphine

from an ammoniacal solution and the subsequent weighing as such, will be productive of error.

Calcium was also found to a considerable extent in the ash of the capsules but was absent from the precipitate produced by ammonia in the concentrated fluid extract.

## THE QUALITY OF COMMERCIAL BLAUD'S PILLS.\*

---

L. E. WARREN, PH. C., B. S.

---

In view of the known instability of ferrous salts, it has been generally held that pills of ferrous carbonate U. S. P. (*Pillule Ferri Carbonatis*, U. S. P.), commonly known as Blaud's pills, are unstable. Thus, the U. S. Pharmacopœia directs that they shall be freshly prepared when wanted. Pharmaceutic manufacturing houses, evidently holding this requirement to be unnecessary, almost universally sell ready-made Blaud's pills. On the other hand, some firms sell special forms of the preparation with claims of keeping qualities superior to the ordinary pill. Nevertheless, it was recently pointed out<sup>1</sup> that a proprietary brand of Blaud's pill, which the manufacturer claimed to be greatly superior in keeping quality to the ordinary Blaud's pill, and an ordinary commercial specimen, were each of good quality. To determine whether there is justification for the sale of ready-made Blaud's pills, and to determine whether the existence of special forms of Blaud's pills is warranted, an examination of the principal market brands was undertaken. Twelve freshly purchased specimens were examined, together with a specimen of each of three brands which were known to be several years old. Three specimens of the freshly-purchased pills were what the manufacturers called "soft mass" pills.

Some of the claims made for the "soft mass" pills are:

"... present advantage of being rapidly soluble and disintegrating in the stomach and intestinal tract. ... Under proper storage conditions they retain their soft consistency and shape perfectly."

"They disintegrate or dissolve readily in the digestive tract."

"They keep well, i. e., do not lose strength under proper conditions of storage."

"They show little tendency to become hard when kept under reasonable conditions."

"They are strictly true to formula."

The "soft mass" pills were "chocolate-coated." The remainder, except where stated to the contrary, were gelatin-coated. Three of the specimens (one of which was old) were not claimed to have been prepared according to the U. S. P. formula, but in general were claimed to contain the ingredients from which ferrous carbonate is produced, so that after ingestion ferrous carbonate in the "nascent" state would be formed in the alimentary tract. A number of the specimens were proprietary. These included Frosst's Blaud Capsules; Laminoids Ferruginous (nascent) Schieffelin; Laminoids Blaud (a specimen known to be at

---

\* Contribution from the Chemical Laboratory of the American Medical Association. Reprinted from the *Journal A. M. A.*, April, 1915.

<sup>1</sup> *Queries and Minor Notes*, the *Journal A. M. A.*, Oct. 4, 1914, p. 1315.

least seven years old) Schieffelin; Ferruginous Blaud, Upjohn (one of the "nascent" preparations), and two specimens of tabloids (one of which was old). The laminoids were uncoated. The tabloids were sugar-coated. With one exception all of the preparations were stated to contain 5 grains of Blaud's mass, which is equivalent to about 1 grain of ferrous carbonate. This one was a specimen of Tabloids Blaud Pill and Aloin which was known to be at least six and one-half years old. One specimen of gelatin-coated Blaud's pills (Parke, Davis & Co.) also was known to be at least six and one-half years old.

Concerning Frosst's Blaud capsules, the following claims were made:

"Blaud capsules 'Frosst' represent freshly precipitated Ferrous Carbonate of a high percentage of purity, deprived of moisture and incorporated with Castor Oil that it may be readily incapsulated in a freely soluble gelatine covering. The capsules do not harden with age nor the contents oxidize."

The cost of Frosst's Blaud capsules was nearly twice that of any other brand of Blaud's pills examined.

The following statements were made concerning Laminoids:

"The Laminoids (Ferruginous, Nascent) consist of two lamina, one of ferrous sulphate and the other of sodium bicarbonate, united by pressure. When brought in contact with water or the fluids of the stomach, chemical action at once takes place, producing fresh ferrous carbonate with the accompanying salts. An excess of carbonate is present to neutralize the acid in the stomach.

"In Laminoids (Ferruginous, Nascent) the physician will find an absolutely reliable means of administering Blaud's formula, without the possibility of the efficiency of this time-tried remedy being impaired by oxidation and the formation of more or less inert material."

The total iron content in the several preparations was determined gravimetrically, and the amount of ferrous carbonate determined by titration. In order to obtain information as to the variation among the individual pills, the assays for ferrous carbonate were made on three pills taken together and on each of three pills taken singly, or four assays in all. The average was then obtained by dividing by six. In some instances, additional assays were made. The results in some cases show considerable variation from the claimed amount of medicinal ingredients. In some of the brands the average results found by titration for ferrous carbonate were somewhat higher than those obtained by calculation from the determination of total iron. Evidently this is due to the fact that because of great variations in the weight of individual pills, uniform samples could not be obtained. The total iron content of the real Blaud pills when calculated to ferrous carbonate varied between 77 and 156 percent of the amount claimed, and that of the "nascent" preparation between 88 and 183.2 percent of the amount claimed. The determinations of ferrous carbonate did not markedly fall below this, showing that oxidation had not taken place to any considerable extent. The analytic findings are given in the accompanying table.

In order to obtain some information as to the relative disintegrating properties of the several brands of pills, tests were carried out by treating a specimen of each (1 pill) with 90 cc. of 0.2 percent hydrochloric acid at ordinary temperature in a 100 cc. Erlenmeyer flask, and agitating the mixture by inverting once every ten minutes. This process was continued until the pill had become disintegrated, or until the experiment had continued for nine hours. In a second series of tests at the end of six hours, the acid was removed from such of the pills as had

TABLE SHOWING QUALITY OF COMMERCIAL BLAUD'S PILLS

Product	Manufacturer	Claims; Composition	Ferrous Carbonate Calculated from Determination of Total Iron, Percent of Claim	Ferrous Carbonate (by Titration of Ferrous Iron), Percent of Claim	Disintegration in Acid Solution (Hours)	Disintegration in Alkaline Solution Following Acid (Hours)
Blaud Capsules	Charles E. Frost & Co.	5 grains, approximately $\frac{1}{2}$ grain of iron in the ferrous state	77	79.2*	No effect except to dissolve coating	No effect

Tabloid Blaud Pill and Albin (old specimen)	Burrroughs, Wellcome & Co.	Blaud Pill 1 grain, 29% ferrous carbonate; Albin $\frac{1}{20}$ grain	106.1	113.1	8.50 6.00†	6.00

\* The apparent discrepancies between the amount of ferrous carbonate as calculated from the determination of total iron and that obtained by titration of ferrous carbonate are explained elsewhere in this paper.

† Not completely disintegrated in twenty-four hours.

not become completely disintegrated, and 90 cc. of a 1 percent solution of sodium carbonate substituted. The digestion was then continued as described above until the pill had become completely disintegrated, or until a period of six hours had elapsed. Although the disintegration would undoubtedly have taken place more rapidly at a temperature of 37° C. and possibly faster in a weak pepsin solution, it is believed that for comparative purposes the results obtained are sufficient.

The results not only showed great variation among the several brands, but also considerable variation among the several pills of the same brand. The Laminoids disintegrated the most readily, but these were not coated. The next in order were the Parke, Davis & Co. brand of soft mass pills and the Sharp & Dohme brand of soft mass pills. It should be noted that the Lilly brand of soft mass pills disintegrated more slowly than the ordinary kind from that firm. The results are given in the table.

The results of the examination refute the commonly assumed instability of ready-made Bland's pills. On the other hand, it is seen that the Bland's pills of the market are not very reliable as to iron content. A range of from 77 to 182 percent of the claimed amount of ferrous carbonate denotes carelessness in manufacturing or lack of proper analytic control over the finished product. Further, the examination demonstrates that the "nascent" preparations, the soft mass pills, and the gelatin encapsulated oily suspension show no advantage over the ordinary kinds. In view of the findings, physicians should consider the advisability of directing the pharmacist to prepare Bland's pills according to the U. S. P. whenever they are prescribed.

---

## THE N. A. R. D. DRAFT FOR A STATE ANTI-NARCOTIC LAW.

---

J. H. BEAL, URBANA, ILL.

---

The N. A. R. D. Draft for an Anti-Narcotic Law suitable for state enactment was prepared by a special committee of three appointed by the N. A. R. D. Executive Committee, the special committee consisting of J. H. Beal, Mr. Hugh Craig, Editor of the N. A. R. D. Journal, and Frank H. Freericks, Esq., of Cincinnati.

The principal purposes of the draft are:

- (1) To promote uniformity in state legislation respecting the possession and sale of anti-narcotic drugs.
- (2) To provide a body of well-considered provisions from which selections can be made for use in states where the existing laws need to be revised in order to bring them into correspondence with the Harrison Act.
- (3) To provide a list of provisions that can be utilized in preparing substitute bills for less acceptable measures which may be introduced into state legislatures.

To the objection that the bill seems rather lengthy it may be said that it is not really as long as it seems to be, its apparent length being due mainly to the separation of Section One into series of brief sub-sections or paragraphs, each dealing with some particular subject or exemption. It is true that all of these sub-sec-

tions might have been condensed into a single paragraph by the liberal use of general terms and connective, but the advantage gained by any such condensation would have been more than offset by the loss in directness and certainty, the two prime requisites in statutory enactments, especially in those which have a criminal bearing.

Another reason the committee had in mind was that an "expanded" or "open" form of draft would render it easier for legislative committees to select the provisions which, with slight modifications, will best suit their requirements.

The same advantage will apply in the striking out of specific provisions which may not be acceptable, or in adding other features which may be desired, since almost any of the specific provisions of the draft can be stricken out or modified without disrupting or destroying the general coherence of the bill.

The following brief review is intended to set forth some of the more important features of the draft.

The first paragraph of Section One adds to the drugs named in the Harrison Act "alpha- and beta-eucaine," and "synthetic substitutes," because it was thought that in most states there would be a demand for their inclusion. If it is not desired that these drugs be included the words can be stricken out without disarrangement of the paragraph.

The second paragraph of this section makes proof of possession *prima facie* evidence of dealing in the drugs possessed, which should be of value in the administration of the law in cases where considerable quantities of the drugs are found in the possession of persons not authorized to deal in them, but where no direct evidence of dealing in them can be secured. The presumption created by the paragraph being only *prima facie*, the defendant will be permitted to show that his possession was lawful and did not involve a dealing in the drugs possessed.

If not desired in the law, the provision can be dropped without marring the draft.

Taking them in their order, the various provisions or exceptions of Section One are as follows:

(a) This proviso exempts from all of the requirements of the law such chemical constituents and derivatives of opium, coca leaves, and their alkaloids as do not possess narcotic or habit-forming properties. There are quite a number of these innocent substances, such as meconic acid, apomorphine, etc., that are neither narcotic nor habit-forming, and it would be absurd to apply to them the restrictions imposed upon dealing in the harmful compounds and derivatives.

The presence of this saving clause in the bill will also tend to check the activity of over-zealous officials who might be inclined to stretch the meaning of the word "derivative" so as to include many other things not intended to be covered by the law as, for example, that "benzoic acid should be regarded as a derivative of cocaine because it is one of the substances produced by the decomposition of that alkaloid," etc.

It cannot be contended that the presence of this sub-section will in any way weaken the effectiveness of the measure for the control of the sale of habit-forming narcotic drugs, since in a later section it is provided that defendant claim-

ing the benefit of any exemption under the law must sustain the burden of proof to establish his right to such exemption.

(*b*) Sub-section *b* enumerates certain persons, manufacturers, hospitals, institutions etc., who may lawfully possess the drugs enumerated in the first paragraph of Section One. To prevent the possible organization of fictitious companies, hospitals, etc., for the purpose of dealing in these drugs in an illegitimate way, this sub-section makes it necessary for all such companies and institutions to be authorized or licensed in accordance with Section Three, and by reference to the latter section it will be seen that the only institutions which will need this special license will be those which do not have a licensed pharmacist, physician, dentist or veterinarian in their employ. As practically all reputable houses and institutions have one or more of such qualified persons on their staffs, this provision should not occasion any hardship to legitimate interests.

If deemed desirable by legislative committees, the list of persons covered by sub-section *b* can be either increased or decreased.

(*c* & *d*) Sub-sections *c* & *d* provide for the possession of the drugs by persons other than those who deal in them on their own account.

(*c*) Sub-section *c* provides for the possession and sale of mixtures containing certain limited amounts of narcotic drugs. The quantities named are the same as those specified in Section Six of the Harrison Act, but the wording is slightly modified to indicate that these permitted quantities can not be cumulated, i. e., that it will not be permissible in such preparations to use the maximum amount of one opium alkaloid plus the maximum amounts of each of the others, unless the total of such alkaloids will not exceed the maximum of that which would be contained in the extractive of two grains of opium. The accompanying proviso is also modified by requiring the admixture of other active drugs with the narcotic drugs, so that the intention of the act could not be defeated by dispensing the latter mixed with large quantities of inert diluents, as water or sugar.

(*f*) The provisions of sub-section *f* govern the sale of narcotics by authorized dealers, etc., to each other or to persons entitled to obtain them without a prescription. Though differing somewhat in their phraseology, these provisions are practically the same in effect as the corresponding provisions of the Harrison Act, so that the use of the order blank and the making of the records required by that act will serve as a compliance with the provisions of the state law, thus avoiding the duplication of records relating to the same transaction.

(*g*) Sub-section *g* relates to prescriptions and the requirements as to dating, filing, repetition, etc., and these requirements are substantially the same as are to be found in most of the state laws which deal with the subject. By the reference which is made to sub-section *e* it is evident that the requirements concerning filing, dating, repetition, etc., do not apply to prescriptions for the quantities specified in that sub-section.

The requirements for the labeling of containers are made specific, so as to prevent the dispensing of narcotic mixtures in such a manner that they cannot be traced to the prescriptions upon which they are alleged to be based.

(*h*) Sub-section *h* relates to the dispensing of narcotic drugs by licensed physicians, dentists, and veterinarians. It does not place any limit upon the *quantity*

which they may dispense in legitimate practice, but does require that a *record shall be kept* when more than the quantities specified are dispensed at one time.

It is conceded that there should be no unnecessary interference with the rights of licensed physicians to administer to their legitimate patients such drugs as they may deem necessary, but it must be remembered that exemptions of this kind, if too liberal, will permit of the practical nullification of the law by unscrupulous practitioners, and it is essential therefore that some limit be placed upon the quantities of such drugs which may be dispensed without keeping a record.

The committee does not assert that the quantities specified in this sub-section are the most appropriate or suitable quantities, and it will be open to legislative committees who may desire to use this sub-section to either increase or decrease these exempted quantities as in their discretion it may seem advisable.

Section Two of the draft relates to the prescribing or furnishing of narcotic drugs for the use of habitues. It permits a licensed physician to prescribe or furnish whatever he may deem necessary for the treatment of a patient for the cure of a drug habit, but requires certain notices to the state board of health and the keeping of certain records, in order that unscrupulous members of the profession may not be tempted to abuse their professional privileges by supplying habitues with the drugs in quantity without making any attempt whatever to effect a cure.

The same section prohibits the prescribing or furnishing of the drugs by a dentist for the use of any person not under his professional treatment as a dentist, or for any other purpose than as a part of such treatment. Veterinarians are also forbidden to prescribe or furnish such drugs for the use of any human being.

Section Three provides that certain manufacturers, dealers, hospitals, etc., that do not have a licensed pharmacist, physician, dentist, or veterinarian in their employ to dispense the drugs covered by the law, must obtain a license from the state board of pharmacy before they can lawfully possess or handle them.

The second paragraph of this section authorizes the sale of preparations containing the quantities exempted in sub-section *c* of Section One only by dealers having a fixed place of business and located at least one mile distant from a licensed pharmacist or physician, and only when specially licensed by the state board of pharmacy. That is to say, itinerant vendors will not be permitted to sell preparations containing narcotic drugs in the quantities named in subsection *c* of Section One, nor will general stores be permitted to handle them unless their place of business is at least one mile distant from the place of business of a licensed pharmacist or the office of a licensed physician.

(This licensing feature, of course, has nothing to do with pharmacists or other persons who are authorized to deal in these drugs by other provisions of the bill.)

Under the third paragraph of this section the state board of pharmacy will not grant such special license unless satisfied that the preparations will be used only for legitimate purposes.

Section Four of the draft relates to penalties. In addition to the offenses ordinarily provided for in anti narcotic laws, it introduces some necessary prohibitions regarding the forgoing, altering, or destruction of prescriptions or other records, the making of false pretenses for the purpose of obtaining narcotic drugs,

etc., and exempts pharmacists from liability for the innocent dispensing of such drugs upon false or altered prescriptions, etc.

The penalties prescribed are *maximum* penalties only, so that the court will be able to "make the punishment fit the crime," by inflicting a light fine for merely technical or trivial offenses.

The last paragraph of this section makes it necessary for those who claim the benefit of exemptions in the law to show by the evidence that they are entitled to such exemptions, and is a quite necessary provision if the law is to be effectively enforced.

Section Five provides for suspension or revocation of the license of persons who have been twice convicted of violating the law, but the convictions must be obtained in a "court of record," i. e., in a court above the grade of the ordinary magistrate's court, and must be for "substantial," and not for merely trivial or technical violations.

The same section also provides the means for the revocation of the license of one who has become so addicted to the use of drugs as to make him an unsafe person to handle them.

The last paragraph of Section Five also makes it possible to prosecute separately a member or agent of a corporation, etc., and inflict upon such persons the penalty of imprisonment and revocation of license.

The remaining sections are of the usual sort, and present no features deserving of comment.

The committee do not offer the draft as an ideal measure that cannot be improved upon, but rather as one which has been formulated after a considerable study of the subject and as one presenting a variety of provisions that should be useful to legislative committees who are charged with the framing of bills for state enactment.

It is natural to expect that in a bill the length of this there will be particular features to which all will not agree. The committee itself did not always reach its decisions by a unanimous vote, and therefore will not feel aggrieved if its conclusions do not in every instance meet with the full approval of those who were not members of the committee.

It is perhaps needless to add that the committee does not advocate the enactment of this or of any other measure unless there is a real need for new legislation to correct existing state laws or to bring them into correspondence with the Federal law, known as the Harrison Act.

---

Never to despise, never to judge rashly, never to interpret other men's actions in an ill sense; but to compassionate their infirmities, bear their burdens, excuse their weakness, make up and consolidate the breaches of charity happened by their fault, to hate imperfections, and ever to love men, yea, even your enemies; therein the touchstone of true charity is known.—*N. Caussin*.

## REPORT OF COMMITTEE ON UNOFFICIAL STANDARDS.

The following portion of the report of the Committee on Unofficial Standards relates to certain crude drugs and chemicals suggested for inclusion in the next revision of the National Formulary, and by order of the Council is published in the Journal in order to afford opportunity for discussion before the standards proposed are finally adopted.

Manufacturers, importers, analysts, and others interested in any of the proposed standards, are requested to send their criticisms and comments to the chairman of the committee, George M. Beringer, 501 Federal St., Camden, N. J.

## ALUMINI CHLORIDUM.

## Aluminum Chloride.

1. It contains Aluminum Chloride ( $\text{Al Cl}_3 \cdot 6\text{H}_2\text{O} = 241.57$ ) corresponding to not less than 29.5 percent of Aluminum Oxide  $\text{Al}_2\text{O}_3$ . Aluminum chloride is to be kept in well-stoppered containers.

2. White, or yellowish white, deliquescent, crystalline powder; nearly odorless; taste sweet and very astringent.

3. Soluble in about 1 part of water and about 3 parts of Alcohol at  $25^\circ\text{C}$ ., also soluble in glycerin.

4. An aqueous solution (1 in 10), should be clear, and show an acid reaction to litmus, and yield with silver nitrate T. S. a white curdy precipitate insoluble in nitric acid, and with ammonia water a white gelatinous precipitate almost insoluble in an excess of ammonia water, and with potassium hydroxide T. S. a white gelatinous precipitate completely soluble in an excess of the reagent.

5. 10 cc. of an aqueous solution (1 in 100), after the addition of .2 cc. of barium chloride T. S. must not become cloudy within one minute (limit of sulphate).

6. 10 cc. of an aqueous solution (1 in 50), must not respond to the Time-Limit Test for *heavy metals* omitting the addition of ammonia water.

7. The addition of .3 cc. of potassium ferrocyanide T. S. to 20 cc. of an aqueous solution (1 in 150), must not produce a blue coloration within one minute (Iron).

8. 5 cc. of an aqueous solution (1 in 25), must not respond to the U. S. P. Modified Gutzet Test for Arsenic.

9. Dissolve about .5 gm. of the salt, accurately weighed, in 100 cc. of water, add 1 gm. of ammonium chloride and then precipitate the aluminum hydroxide by the addition of a slight excess of ammonia water to the boiling solution. Collect the precipitate on a filter, wash it with distilled water, dry, ignite thor-

oughly and weigh. The weight of the aluminum oxide so obtained must not be less than 20.5 percent of the weight of the aluminum chloride used.

## ALUMINI SULPHAS.

## Aluminum Sulphate.

1. It should contain not less than 99.5 percent of pure Aluminum Sulphate  $\text{Al}_2(\text{SO}_4)_3 \cdot 13\text{H}_2\text{O} = 630.67$ .

2. A white, crystalline powder, or shining plates, or crystalline fragments; without odor, having a sweetish and afterwards an astringent taste, and permanent in the air.

3. Soluble in 1 part of water at  $25^\circ\text{C}$ . ( $77^\circ\text{F}$ .), more soluble in boiling water, but insoluble in alcohol.

4. When gradually heated to about  $200^\circ\text{C}$ . ( $392^\circ\text{F}$ .), it loses its water of crystallization (45.7 percent of its weight).

5. The aqueous solution of the salt has an acid reaction upon blue litmus paper.

6. The aqueous solution of the salt yields, with barium chloride T. S., a white precipitate insoluble in hydrochloric acid; and with potassium hydroxide T. S., a white, gelatinous precipitate which is soluble in an excess of the alkali, but which is again separated on the addition of a sufficient amount of ammonium chloride T. S.

7. If 1 gm. of Aluminum Sulphate be gently heated with 5 cc. of potassium hydroxide T. S., the liquid should not evolve the odor of ammonia.

8. A filtered, aqueous solution of the salt (1 in 10) should not become more than faintly opalescent within five minutes after the addition of an equal volume of tenth normal sodium thiosulphate V. S. (limit of *free acid*).

9. The aqueous solution of the salt (1 in 20) should not respond to the U. S. P. Time-Limit Test for *heavy metals*.

10. The addition of 5 drops of potassium ferrocyanide T. S. to 20 cc. of the aqueous solution of the salt (1 in 50) should not pro-

duce at once a blue coloration (limit of iron).

11. 5 cc. of an aqueous solution (1 in 25) must not respond to the U. S. P. Modified Gutzzeit Test for Arsenic.

12. Dissolve about .5 gm. of the salt, accurately weighed, in 100 cc. of water, add 1 gm. of ammonium chloride and then precipitate the aluminum hydroxide by the addition of a slight excess of ammonia water to the boiling solution. Collect the precipitate on a filter, wash it with distilled water, dry, ignite thoroughly and weigh. The weight of the aluminum oxide so obtained must not be less than 16.1 percent of the weight of the aluminum sulphate used.

#### ANTIMONII OXIDUM.

##### Antimony Oxide.

1. It contains not less than 97 percent of antimonous oxide ( $\text{Sb}_2\text{O}_3=288.4$ ).

2. Antimony Oxide is a white or grayish white powder odorless and tasteless.

3. It is insoluble in water, alcohol or nitric acid, readily soluble in hydrochloric acid without effervescence, and also in a warm solution of tartaric acid or in a boiling solution of potassium bitartrate.

4. When heated it turns yellow, becoming white again on cooling. At a dull red heat it fuses to a yellowish liquid, volatilizing at a higher temperature.

5. When dissolved in a slight excess of hydrochloric acid and this solution diluted with a large volume of water, a white precipitate is produced which is changed to orange by hydrogen sulphide.

6. The solution of 0.1 gm. of the oxide in 3 cc. of hydrochloric acid and 5 cc. of distilled water is not rendered turbid at once by a few drops of barium chloride T. S. (sulphate).

7. The solution of 0.1 gm. of the oxide in 10 cc. of distilled water and 1 gm. of tartaric acid does not become more than slightly opalescent after the addition of 0.2 cc. nitric acid and 0.2 cc. silver nitrate T. S. (chloride).

8. Dissolve 0.5 gm. of the oxide in 10 cc. of hydrochloric acid, dilute the solution with distilled water until it begins to become permanently turbid and then precipitate with hydrogen sulphide. This precipitate when thoroughly washed with distilled water dissolves in ammonium or sodium sulphide T. S., without leaving a black insoluble residue (copper, lead).

9. A solution of 0.1 gm. of Antimony Oxide in 5 cc. of hydrochloric acid does not respond to Bettendorf's test for arsenic.

10. Weigh accurately about 0.2 gm. of Antimony Oxide, dissolve it by warming with a solution of 1 gm. of tartaric acid in 10 cc. of distilled water, (adding a few drops of hydrochloric acid to aid the solution), nearly neutralize the solution with sodium carbonate, then add 40 cc. of a cold saturated solution of sodium bicarbonate and titrate at once with tenth-normal iodine, using starch T. S., as indicator.

11. The titration shows not less than 97 percent of antimonous oxide. Each cc. of tenth-normal iodine corresponds to 0.007210 gm. of antimonous oxide.

#### ANTIMONII SULPHIDUM PURIFICATUM.

##### Purified Antimony Sulphide.

1. It contains antimony corresponding to not less than 97 percent of antimony trisulphide ( $\text{Sb}_2\text{S}_3=336.61$ ).

2. Purified Antimony Sulphide is a heavy grayish black powder, odorless and tasteless.

3. It is insoluble in water or alcohol, soluble in hydrochloric acid with the evolution of hydrogen sulphide.

4. At a temperature below a red heat it fuses to a dark brown liquid.

5. A solution made by boiling the sulphide with a moderate excess of hydrochloric acid, until the vapors no longer blacken lead acetate paper, yields, when added to about ten times its volume of water, a white precipitate which is changed to orange by hydrogen sulphide.

6. Intimately mix 2 gm. of the sulphide with 8 gm. of pure sodium nitrate, fuse the mixture in a porcelain crucible, and after cooling boil the mass with 25 cc. of distilled water and filter. Acidulate the filtrate with nitric acid, boil it until no more nitrogen oxide is evolved, then dissolve in the solution about 0.1 gm. of silver nitrate, filtering again, if necessary, and cautiously over lay 10 cc. of this solution with a few drops of ammonia water. Not more than a white cloud, but no red or reddish precipitate appears at the line of contact of the two liquids (limit of arsenic).

7. Weigh accurately about 1 gm. of Purified Antimony Sulphide, mix it with 20 cc. of hydrochloric acid, and then with a clear solution of 5 gm. of tartaric acid in 10 cc. of water and heat the mixture gently on the

water bath until the vapors no longer blacken lead acetate paper. Now filter the solution, wash the residue, if any, with distilled water until the washings are neutral to litmus and ignite it. The weight of the residue does not exceed 1 percent.

8. Dilute the filtrate and washings from the preceding test to 200 cc., nearly neutralize 50 cc. with sodium carbonate, add 40 cc. of a cold saturated solution of sodium-bicarbonate and titrate at once with tenth-normal iodine, using starch T. S. as indicator.

9. The titration indicates an amount of antimony corresponding to not less than 97 percent of antimony trisulphide. Each cc. of tenth-normal iodine consumed corresponds to 0.008415 gm. of antimony trisulphide.

### BERBERIS.

Berberis (Oregon Grape Root).

1. The rhizome and roots of species of the section *Odostemon Rafinesque* of the genus *Berberis* Linné (*Fam. Berberidaceae*).

2. Cylindrical, more or less knotty, strongly branched, usually cut into pieces of varying length and up to 45 mm. in diameter; externally light yellowish-brown, longitudinally wrinkled and short scaly; fracture hard and tough; bark 1 mm. in thickness, easily separable into layers, wood yellow, the color more pronounced upon wetting, distinctly radiate, and showing rings of growth; pith of rhizome small, sometimes excentral; slightly odorous; taste distinct, very bitter, tingeing the saliva yellow.

3. Pieces without the bark should be rejected.

4. *Powder*—Yellowish-brown; composed chiefly of fragments of wood-fibers associated with a few tracheae and medullary rays; wood fibers yellowish, scarcely giving any reaction with phloroglucinol T. S. and hydrochloric acid, and with large, simple, transverse pores; tracheae chiefly with bordered pores, occasionally reticulate; medullary rays 4- to 12-cells wide, and in very long rows; starch grains single or 2- to 3- compound, the individual grains being irregularly spherical, 0.003 to 0.010 mm. in diameter and occasionally larger.

### BISMUTH CITRAS.

Bismuth Citrate.

1. Containing Bismuth Citrate [ $\text{BiC}_4\text{H}_4\text{O}_7 = 397.04$ ] equivalent to not less than 55 percent, nor more than 59 percent of pure bismuth oxide.

2. Bi-muth Subnitrate, one hundred grammes ..... 100 gm.  
Citric Acid, seventy-five grammes 75 gm.  
Distilled Water, a sufficient quantity.

Mix the Bismuth Subnitrate and the Citric Acid with 400 cc., *four hundred cubic centimeters* of Distilled Water, and heat on a bath of boiling water, with frequent stirring, until a drop of the mixture yields a clear solution with ammonia water. Then add *five hundred cubic centimeters* of Distilled Water, allow the suspended matter to deposit, wash the precipitate, first by decantation, and afterwards on a strainer, with Distilled Water, until the washings are tasteless, and dry the residue at a gentle heat.

3. A white, amorphous or micro-crystalline powder, odorless and tasteless. Insoluble in water or alcohol, but soluble in ammonia water, and in solutions of alkali citrates.

4. When strongly heated the salt chars, and, on ignition, leaves a more or less blackened residue having a yellow surface, and soluble in warm nitric acid. This solution, when dropped into a large excess of water, occasions a white turbidity.

5. A solution of 1 gm. of Bismuth Citrate in ammonia water, when treated with hydrogen sulphide in excess, yields a black precipitate.

6. Deprive the filtrate from the latter of the excess of hydrogen sulphide by heating it; a cooled portion of the liquid boiled with an excess of lime water, yields a white precipitate.

7. Mix 0.01 gm. of the salt with 1 cc. of water, add 5 cc. of sulphuric acid, cool the mixture and then carefully pour over it 5 cc. of ferrous sulphate T. S. without mixing; no red or brown zone should appear within 5 minutes (*nitrate*).

8. Ignite 3 gm. of the salt, dissolve the residue in just a sufficient quantity of warm nitric acid, and pour the solution into 100 cc. of distilled water; a white precipitate is produced. Separate the filtrate from this precipitate and evaporate it on a water-bath to 30 cc., again filter the liquid and divide the new filtrate into portions of 5 cc. each; these should respond to the tests for purity described under *Bismuthi Subcarbonas* (See U. S. P. IX), (*lead, copper, silver* and sulphates).

9. Three gm. of Bismuth Citrate, after ignition and treatment with nitric acid as di-

rected in the following test, should not respond to the Bettendorf's Test for arsenic as stated in the U. S. P.

10. Ignite 1 gm. of Bismuth Citrate thoroughly, in a porcelain crucible, and, after cooling, add 5 cc. of nitric acid to the residue, drop by drop, warming until complete solution is effected, then evaporate to dryness, and again ignite it; a residue of bismuth oxide should be left weighing not less than 0.56 gm., nor more than 0.58 gm.

11. *Average dose.*—0.125 gm.=125 milligrammes (2 grains).

#### BRAYERA.

Brayera. Cusso. Kousso.

1. The dried panicles of the pistillate flowers of *Hagenia Abyssinica* (Bruce) Gmelin (Fam. *Rosaceae*).

2. In rolls or flattened bundles from 25 to 40 cm. long, reddish-brown, each branch arising from the axil of a sheathing bract, and two rounded bracts at the base of each flower; calyx-tube top-shaped, pubescent, and subtended by a circle of five rigid, spreading, obovate, purple-veined bracts, which are larger than the five usually shrivelled and incurved calyx lobes; petals five, caducous and usually absent in the drug; carpels two; styles exserted, stigmas broad and hairy; odor slight; taste bitter.

3. The large stems should be rejected.

4. *Average dose.*—16 gm. (240 grains).

#### BROMUM.

Bromine.

1. It should contain not less than 97 percent of Bromine  $\text{Br}=79.92$ , and not more than 3 percent of chlorine. Bromine should be kept in glass-stoppered bottles in a cool place, the bottle being enclosed in a larger vessel with the space between filled with some compound capable of absorbing and combining with any Bromine vapors which might be given off.

Bromine is a heavy, dark brownish-red, mobile liquid, evolving, even at ordinary temperatures, reddish fumes, highly irritating to the eyes and lungs, and having a peculiar, suffocating odor, resembling that of chlorine.

3. Specific gravity: About 3.016 at 25° C. Boiling point, about 63° C.

4. Bromine is soluble in water, and freely soluble in alcohol, ether, chloroform and carbon disulphide.

5. On exposure to air or to heat, it is volatilized.

6. Bromine destroys the color of solutions of litmus and indigo, and imparts a yellow color to starch T. S.

7. On adding 5 cc. of Bromine to an excess of potassium hydroxide T. S., it should combine to form a permanently clear liquid, without the separation of oily drops (*organic bromine compounds*).

8. On shaking 10 cc. of a saturated aqueous solution of Bromine with a slight excess of reduced iron until it becomes nearly colorless, the filtered liquid, on the addition of 5 drops of ferric chloride T. S. and of 5 drops of starch T. S., should not assume a blue color (*iodine*).

9. Dissolve 10 gm. of potassium iodide in 25 cc. of distilled water, introduce the solution into a 100 cc. glass-stoppered graduated flask and determine accurately the weight of the flask and its contents. Add about 1 gm. of Bromine to the contents of the flask and determine its exact weight by noting the increase over the previous weighing and then fill the flask to the mark with distilled water. The titration of 25 cc. of this solution with tenth-normal sodium thiosulphate V. S., using starch T. S. as indicator and the calculation to the amount of Bromine originally taken, should show not less than 97 percent of Bromine (with not more than 3 percent of chlorine). Each cubic centimeter of tenth-normal sodium thiosulphate V. S. used corresponds to 0.007992 gm. of Bromine (Br) and 0.003346 gm. of Chlorine (Cl).

Each gramme of Bromine, U. S. P., (containing not more than 3 percent of chlorine) corresponds to not more than 129.831 cc. of tenth-normal sodium thiosulphate V. S.

#### CALCI PHOSPHAS PRÆCIPITATUS.

Precipitated Calcium Phosphate.

1. It should contain, when dried to constant weight, not less than 96 percent of Calcium Phosphate,  $\text{Ca}_3(\text{PO}_4)_2=310.29$ .

2. Precipitated Calcium Phosphate occurs as a white, amorphous or micro-crystalline, bulky powder, odorless and tasteless; permanent in the air. At an intense, white heat, the salt fuses without decomposition.

3. Almost insoluble in cold water; partly decomposed by boiling water, which dissolves out the acid salt; almost insoluble in acetic acid, except when freshly precipitated; easily dissolved by hydrochloric or nitric acid; insoluble in alcohol.

4. When moistened with silver nitrate T. S., either before or after ignition, the salt

acquires a yellow color (distinction from *acid calcium phosphate*, which, after ignition, when moistened with silver nitrate T. S., remains white).

5. For applying tests of identity and of purity, shake 2 gm. of precipitated Calcium Phosphate with 20 cc. of distilled water, add nitric acid, drop by drop until solution is effected, and then add sufficient water to make the liquid measure 40 cc. While making this solution, no effervescence should occur on adding the acid (carbonate).

6. From a portion of this solution the salt is precipitated unchanged by a slight excess of ammonia water. Silver nitrate T. S. added in excess to this mixture and then acetic acid, drop by drop, until the excess of ammonia is neutralized, will cause the color of the precipitate to change from white to yellow.

7. From another portion ammonium molybdate T. S. precipitates yellow ammonium phosphomolybdate; the reaction is accelerated by a gentle heat, not exceeding 65° C.

8. Five cc. of the solution, acidulated with nitric acid to which 0.5 cc. of silver nitrate T. S. is added should result in the production of not more than a slight turbidity (chloride).

9. Five cc. of the solution, strongly acidulated with nitric acid, to which 1 cc. of potassium sulphate T. S. is added, should not result in turbidity upon standing 15 minutes. (*barium*).

10. An aqueous solution of Calcium Phosphate (1 in 20) obtained by shaking the salt with distilled water, adding hydrochloric acid, drop by drop, and heating until solution is effected, should not respond to the U. S. P. Time-Limit Test for *heavy metals*.

11. Five cc. of a solution of Calcium Phosphate, in diluted hydrochloric acid (1 in 25) should not respond to the U. S. P. Test for *arsenic*.

12. *Average dose*.—1 gm. (15 grains)

### CALENDULA.

*Calendula*.

1. The dried ligulate florets of *Calendula officinalis* Linné (Fam. *Compositae*).

2. Florets, 15 to 25 mm. long, yellow or orange-colored, one- to three-toothed, the short hairy tube occasionally enclosing the remnants of a filiform style and blind stigma; odor slight, somewhat heavy; taste slightly bitter, faintly saline.

3. *Average dose*.—1 gm. (15 grains).

### CASSIA FISTULA.

*Cassia Fistula*.

1. The dried fruit of *Cathartocarpus fistula* Persoon (Fam. *Leguminosae*).

2. Cylindrical, 25 to 50 cm. long, about 20 mm. in diameter, chestnut-brown in color, on one side a longitudinal groove and on the other a smooth line or slight ridge, indicating the sutures; indehiscent, the cavity divided transversely into numerous compartments, each containing a reddish-brown, glossy, flat-tish-ovoid seed embedded in a blackish-brown sweet pulp; odor resembling that of prunes.

3. *Average dose*.—4 gm. (60 grains).

### CATARIA.

*Cataria*. Catmint. Catnep.

1. The dried leaves and flowering tops of *Nepeta cataria* Linné (Fam. *Labiatae*).

2. Tops, when whole, 10 to 20 cm. in length, much branched, commonly crushed and broken; stems quadrangular, downy; leaves opposite, those of the stem petiolate 2 to 7 cm. long, rounded heart-shaped at the base, oblong, pointed at the apex, pale gray-green, soft hairy above, downy beneath, margin deeply crenate, floral leaves small, bract like; flowers in dense, interrupted spikes; flower small, calyx hairy, tubular, curved obliquely and equally 5 toothed, corolla whitish, dotted with purple, throat dilated, bilabiate, the upper lip erect, 2 cleft, leaves spreading, 3 cleft, the middle lobe largest, sometimes notched; stamens 2 pairs ascending under the upper lip, lower pair shorter. Odor faintly aromatic and mint-like; taste bitter, pungent, aromatic.

It should yield not more than 16 percent of ash.

### CHIMAPHILA.

*Chimaphila Pipsissewa*.

1. The dried leaves of *Chimaphila umbellata* (Linné) Nuttall (Fam. *Ericaceae*), with not more than 5 percent of stem or other foreign substances.

2. Oblanceolate, 2.5 to 5 cm. long, 8 to 18 mm. broad, the upper portion coarsely and sharply serrate, acute or somewhat obtuse, the lower wedge-shaped and nearly entire; coriaceous, smooth and uniformly dark green on the upper surface, paler beneath, the veins being very prominent; odor slight; taste astringent and bitter.

3. *Average dose*.—2 gm. (30 grains).

(to be continued)

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

<>

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished with not to exceed 50 reprints, without cover, of papers accepted for publication in the JOURNAL.

Larger numbers of reprints will be supplied by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

100 copies, 4 pages, no cover,	\$2.50, with cover,	\$4.50.
200 copies, 4 pages, no cover,	\$3.00, with cover,	\$5.50.
50 copies, 8 pages, no cover,	\$2.75, with cover,	\$4.50.
100 copies, 8 pages, no cover,	\$3.50, with cover,	\$5.00.
200 copies, 8 pages, no cover,	\$4.50, with cover,	\$6.50.
50 copies, 12 or 16 pages, no cover,	\$4.00, with cover,	\$5.50.
100 copies, 12 or 16 pages, no cover,	\$5.00, with cover,	\$6.50.
200 copies, 12 or 16 pages, no cover,	\$6.50, with cover,	\$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

## PAPERS FOR THE ISSUES OF JUNE, JULY, AUGUST, AND SEPTEMBER.

As the papers that were read at the Detroit meeting of the American Pharmaceutical Association have nearly all been printed, the editor requests that contributions for the succeeding numbers of the Journal be submitted. It is not desired to interfere with the work of the Sections and doubtless papers read at the Branch meetings will contribute largely to our present needs.

<>

### POISONS AND HABIT-FORMING DRUGS.

A digest of laws and regulations relating to the possession, use, sale and manufacture of poisons and habit-forming drugs enacted during 1913 and 1914, now in force in the United States. By Martin I. Wilbert, Technical Assistant, Hygienic Laboratory, United States Public Health Service. Reprint No. 240 from the Public Health Reports, Washington, Government Printing Office, 1915.

This pamphlet of 100 pages is designed as a second supplement to Public Health Bulletin No. 56, a Digest of Laws and Regulations Relating to Poisons and Habit-Forming Drugs, published by the Public Health Service in 1912. This second supplement presents a compilation of the laws and regulations enacted in thirty-two of the political divisions of the United States during 1913 and 1914 that are not included in either of the earlier publications. The extracts from and the references to these several laws and regulations have been arranged under the following headings: "Sale and Use of Poisons," "Sale and Use of Cocaine and Narcotics," "Drugs to be Announced on Label," "Poisons in Articles of Commerce," "Occupational Intoxications," "Methyl Alcohol," "Sale and Use of Intoxicating Liquors," "Practice of Pharmacy," and "Standards for Drugs."

The introductory portion, including 16 pages, reviews some of the current activities and presents a number of tables giving interesting data regarding the use and abuse of poisons and habit-forming drugs.

In discussing the sale and use of intoxicating liquors the suggestion is made that retail druggists might take advantage of the precedent established under the provisions of the Federal anti-narcotic law and secure legislation providing for a special license for the sale of alcohol for medicinal and mechanical

purposes. By extending the principle of registration and record embodied in the Federal anti-narcotic law to cover alcohol and alcohol containing medicines, it would be possible to differentiate between dealers in alcohol and alcoholic liquids for medicinal purposes and dealers who sell alcoholic liquids for beverage purposes. Such a provision could be made to furnish the necessary information to make prohibition and local option laws more effective, would practically preclude the sale of alcohol for beverage purposes under the guise of medicine and thus afford to officials in prohibition or local option territory an opportunity to enforce restrictive legislation in a way hitherto impossible. A distinct form of license with provisions to restrict the sale of alcohol to strictly legitimate channels would also serve to remove from pharmacists the suspicion of selling alcoholic liquids for beverage purposes and thus tend to re-establish the respect due to all honest members of our profession. To pharmacists who are interested in the promulgation of restrictive legislation this compilation of laws and regulations will be particularly interesting and useful. To the extent of the edition, the reprint may be had on application to the Surgeon General of the United States Public Health Service, and additional copies may be procured from the Superintendent of Documents, Government Printing Office, Washington, D. C., at ten cents a copy.

&lt;&gt;

*Elementary Practical Chemistry*, by J. E. Myers and J. B. Firth. The book is designed for medical students preparing for their first examination in practical chemistry. The authors say that the syllabuses of most of the medical examining bodies of the British Isles have been carefully considered, with a view of including herein all information necessary to meet their requirements.

The book is divided into four parts, as follows: (1) General Methods of Chemical Manipulation; (2) Inorganic Qualitative Analysis; (3) Inorganic Quantitative Analysis, including examples in both gravimetric and volumetric work; (4) Practical Organic Chemistry.

The authors have been very successful in condensing the various branches of chemistry in such a small volume, including at the same time most essential laboratory exer-

cises. A purpose seems to have been to explain simple apparatus, and the chemicals have been selected with thought for cost and in smallest amounts. The explanations and directions are plainly stated. The little book conforms to the claims of the authors. J. B. Lippincott Company are the American publishers, representing Charles Griffin & Co. of London.

&lt;&gt;

*Honorary President Geo. H. Schafer* directs our attention to the following statement in the Chicago Tribune by Dr. W. A. Evans: "The Pharmaceutical Journal quotes a druggist as saying that for every ounce of laudanum dispensed on prescriptions, he sells at least a gallon to self-dopers. He says that this is the rule among drug stores." The reference is indefinite, the last clause is not only false but manifestly unjust. Charges of this kind should not go unchallenged. Dr. Evans and the Tribune should have considered the statement in connection with the efforts put forth by pharmacists to regulate the dispensing of narcotics.

&lt;&gt;

General Secretary William B. Day attended the banquet of the Pharmacy Department of Purdue University, Lafayette, Ind., May 6th. Aside from an enjoyable occasion, the Secretary found that a number of applications for membership in the American Pharmaceutical Association awaited him.

&lt;&gt;

L. C. Gill, formerly of Texas, now representing William R. Warner & Co. in Panama, has sent in his application for membership in the American Pharmaceutical Association.

&lt;&gt;

Bolivar Jurado, Professor of Chemistry and Physics in the National Institute of Panama, has been appointed Municipal Chemist for the City and District of Panama. Professor Jurado joined the Association four years ago; he has the possibility in mind that a Branch may be formed on the Isthmus.

&lt;&gt;

Every day I am more sure of the mistake made by good people universally in trying to pull fallen people up instead of keeping the yet safe ones from tumbling after them; and in always spending their pains on the worst instead of the best material.—Ruskin

## The Bulletin Board

### NATIONAL COMMITTEE ON THE PHARMACEUTICAL SYLLABUS. BULLETIN III.

A report on the affairs of the Committee to date.

In the treasurer's report made in August at Detroit and of which copies were sent to members of the committee on October 20, 1914, there appeared a balance of \$246.95 due the printers, and a balance of \$115.82 due Dr. Taylor for cash advanced. These debts were more than balanced by the value of the 426 copies of the Syllabus on hand and of the plates for printing the Syllabus. Dr. Taylor has requested that the balance due the printers be paid first.

The three parent organizations have sent the usual annual contribution of \$25 each, and with these and receipts from the sale of the Syllabus \$150 have been paid to the printers on account, leaving an unpaid balance of \$92.95. It is estimated that all debts can be paid before the end of 1915.

A circular letter advertising the Syllabus was sent on December 1, 1914 to members of Pharmacy Boards and College Faculties throughout the United States. This resulted in the sale of about 50 copies. Some members of the Committee have sold 60 or more copies to their students in Colleges of Pharmacy. There are about 300 copies in stock, enough to last for a year or more, unless there is an unexpectedly large sale for them.

The storage and insurance of the plates for printing the Syllabus was referred to the Executive Committee with power. The Committee has had them transferred to the New York Education Building and insured at a total cost of \$2.00 for the insurance.

Harry B. Mason, John Culley and Julius A. Koch have been reappointed to the Committee by the A. Ph. A., the N. A. B. P. and the A. C. P. F., respectively. Ernst O. Engstrom, of Pittsfield, Mass., Clarence O. Bigelow, of New York, and Turner A. Miller, of Richmond, Va., have resigned from the Committee, and the N. A. B. P. has appointed John W. Gayle, George C. Diekmann and Mason C. Beebe in their respective places.

The Committee now has the following membership:

FROM THE AMERICAN PHARMACEUTICAL ASSOCIATION.

Term Expires

- 1915 George M. Beringer, Camden, N. J.
- 1916 William B. Day, 74 East 12th St., Chicago, Ill.
- 1917 Willis G. Gregory, Buffalo, N. Y., 344 Richmond Ave.
- 1918 Henry L. Taylor, Albany, N. Y., 2 Woodlawn Ave.
- 1919 Charles Caspari, Jr., Baltimore, Md., University of Maryland.
- 1920 Eugene G. Eberle, Dallas, Texas, P. O. Box 1539.
- 1921 Harry B. Mason, Detroit, Mich., P. O. Box 484.

FROM THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY.

- 1915 Charles Gietner, St. Louis, Mo., 203 South Broadway.
- 1916 William Mittelbach, Booneville, Mo.
- 1917 John W. Gayle, Frankfort, Ky., Ann St. and Broadway.
- 1918 William H. Rudder, Salem, Ind.
- 1919 George C. Diekmann, New York City, 115 West 68th St.
- 1920 Mason C. Beebe, Burlington, Vt., 75 Church St.
- 1921 John Culley, Ogden, Utah, 2479 Washington Ave.

FROM THE AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES.

- 1915 Theodore J. Bradley, Boston, Mass., 70 St. Botolph St.
- 1916 Henry H. Rusby, Newark, N. J., 776 DeGraw Ave.
- 1917 James H. Beal, Urbana Ill., 801 W. Nevada St.
- 1918 Charles W. Johnson, Seattle, Wash., College of Pharmacy, University of Washington.
- 1919 Clement B. Lowe, Philadelphia, Pa., 6630 Germantown Ave.
- 1920 William C. Anderson, Brooklyn, N. Y., 315 Greene Ave.
- 1921 Julius A. Koch, Pittsburgh Pa., Bluff and Pride Sts.

The sub-committees now have the following membership:

#### MATERIA MEDICA.

Henry H. Rusby, *Chairman*, Mason C. Beebe, George M. Beringer, John Culley, William B. Day, Clement B. Lowe, and William Mittelbach.

#### CHEMISTRY.

Julius A. Koch, *Chairman*, William C. Anderson, Theodore J. Bradley, George C. Diekmann, John W. Gayle, Charles W. Johnson, Henry L. Taylor.

#### PHARMACY.

James H. Beal, *Chairman*, Charles Caspari, Jr., Eugene G. Eberle, Charles Gietner, Willis G. Gregory, Harry B. Mason, William H. Rudder.

Corrections of any errors in the above lists should be sent to the Secretary at once as the lists will soon be printed.

WILLIS G. GREGORY, *Chairman*.

THEODORE J. BRADLEY, *Secretary-Treasurer*.

## SECTION ON EDUCATION AND LEGISLATION.

Partial list of topics upon which papers are desired to be read at the San Francisco A. Ph. A. meeting under the auspices of the Section on Education and Legislation:

First—Prescription pricing. Is it desirable to consider a revision of the present method for pricing medicines sold upon prescription? Is it advisable to discuss this subject with medical societies with a view of overcoming the evil of dispensing by physicians?

Second—How can the individual druggist be helpful to bring about a correct public understanding of the druggist in his relationship to the public?

Third—Should Pharmaceutical Ethics be taught in a separate course, or can needs in this respect be fully served by teaching them incidentally?

Fourth—What special methods may be adopted by teachers in Colleges of Pharmacy to secure the best work from students without examinations?

Fifth—How can the druggist be helpful to assist the boards of health in educating the public regarding sanitation and the proper care of contagious diseases?

Sixth—Proprietary and Patent Medicines. Is it just to require publication of complete formula? Is the public welfare served by requiring publication, only, of potent drug content, and how in such case should potent drug content be defined?

Seventh—Teachers in Colleges of Pharmacy. Can the fitness of those who desire to teach in Colleges of Pharmacy be determined without regulation? Should there be a standard educational requirement for teachers in Colleges of Pharmacy?

Eighth—Can lack of preliminary education be overcome by supplementing the regular courses in Colleges of Pharmacy with such general educational courses as will most properly fit the student?

Ninth—Is the public welfare properly safeguarded by allowing the prescribing and distribution of medicines without record of some sort open to possible inspection by third persons and by the authorities?

Tenth—What general plan can be adopted to retain or to again establish a condition which will offer sufficient opportunity for the skilled pharmacist?

Eleventh—To what extent should Pharmacology be taught in Schools of Pharmacy?

Twelfth—Uniform marking systems and methods of grading work done by students in Schools of Pharmacy.

Thirteenth—How much time of a Pharmacy Curriculum should be devoted to Bacteriology?

Fourteenth—To what extent should Toxicology be taught in Schools of Pharmacy?

Fifteenth—How much time should be devoted to the study of Pharmacognosy?

Sixteenth—In what course and by what methods are drugs of the Organic Chemistry Laboratory best taught in Pharmaceutical Schools?

Seventeenth—Complete and detailed outlines of courses of study dealing only with Prescription Work.

Eighteenth—Should a library reading course be made a part of the curriculum of Schools of Pharmacy?

Many of the above topics, while not entirely new, should be timely and of deep interest to the teaching members of the Section. Papers are, therefore, especially solicited from those engaged in the teaching of the various subjects mentioned. It should be remembered that, according to an established custom, the time required for the reading of a paper should not be more than fifteen minutes.

Additional subjects are solicited.

Papers should be in the hands of the Chairman or Secretary of the Section not later than the first of August.

R. A. KUEVER, Secretary.

Iowa City, Iowa.

## THE MODERN PHARMACY LAW.

The work of drafting a Modern Pharmacy Law by the Section on Education and Legislation of the American Pharmaceutical Association is progressing splendidly. Chairman Freericks has been able to secure appointments from forty-three state Pharmaceutical Associations and forty-three state Boards of Pharmacy. In other words, forty-three states have appointed subcommittees of two, one from the examining board and one from the state association, to co-operate in the work of drafting a Modern Pharmacy Law. These various subcommittees together in one body are known as the Voluntary Conference of the Section on Education and Legislation—each man having signified his willingness to serve and his interest in the work.

## MEMBERS OF THE VOLUNTARY CONFERENCE.

*Appointees of the State Boards.*

W. E. Bingham, Tuscaloosa, Ala.  
 T. L. McCutchen, Yuma, Ariz.  
 Frank Schachleiter, Hot Springs, Ark.  
 Frank E. Mortenson, care Dundee Pharmacy, Pueblo, Colo.

The Section on Education and Legislation has been very fortunate in securing for its Voluntary Conference not only pharmacists of the very highest type but men who are thoroughly qualified and have a great deal of interest in legislative work. The personnel of the Conference insures in a measure the success of the drafting of the Modern Pharmacy Law.

Chairman Freericks announces that there has been some delay purposely in this work in order that legislative work in the various states might not conflict. But now, with that mostly out of the way, the work of making the first draft of the Modern Pharmacy Law is to proceed as rapidly as possible. The Chairman suggests that representatives of the Board of Pharmacy and of the State Association get together, wherever possible, to agree upon what they deem advisable in the way of changes in their state laws. In states where the representatives are not in close proximity to each other or are unable to get together for other reasons, a separate copy of their present law, with such notation of changes as they deem advisable, should be sent individually. Moreover, Chairman Freericks has requested that these various state laws with suggestions are to be sent in by the first of May since the sitting and compiling and reconciling of all suggestions for changes for improvements will be a difficult and tedious task.

To facilitate matters each member of the Voluntary Conference has been asked for an expression of his opinion regarding the advisability of embodying in the draft of the Modern Pharmacy Law provisions which will cover in some manner the following special features:

First.—Is it deemed advisable that the Modern Pharmacy Law should contain a provision which would require the manufacturer of proprietary medicines to show on the label,

the contents of potent drugs? This does not mean to require publication of formula, but simply means the publication of potent drug contents. And in such case how can potent drug contents be best defined?

Second.—Is it deemed possible to restrict the sale of proprietary medicines containing potent drugs to qualified people exclusively, or at least in all places where there are such qualified people within a certain distance? In such case what should be the distance prescribed from where qualified people are located, so as to permit beyond such distance the sale by unqualified people?

Third.—Should the manufacturer of proprietary medicines be required to have a registered pharmacist in charge, or should he, at least, be required to become licensed by the Board of Pharmacy for the manufacture of his proprietary medicines?

Fourth.—In view of the great difference of opinion which exists in different sections of the country regarding college graduation as a prerequisite for registration as pharmacists, is it possible to reconcile the strongly opposing views, so that in some manner progress might be secured in every state without coming in conflict with the opinion of those who do not favor the college prerequisite? To make this thought clear, take for instance the states in which college education is not today a prerequisite for registration as pharmacist, would it be feasible to allow such condition to continue without interference, and then in such states create an additional class to whom the college prerequisite would apply, as for instance to give such class the name "Registered Pharmaceutical Chemist"? Such Pharmaceutical Chemists would have the right to exercise all of the present-day functions of the Registered Pharmacist, and some additional functions which might subsequently be decided on, which in no manner would interfere with the privileges and prerogatives of the present-day Registered Pharmacist. Members of the Conference who are opposed to the prerequisite are respectfully asked not to become impatient with this suggestion immediately, but to please give it thorough consideration. It would seem that this would open the way for young men in every state to so qualify themselves under the laws of their state, so as to later on, if conditions made it necessary, be able to go into any and every state and become there registered as a Pharmacist. At the same time such inauguration

of a third class in states where the prerequisite for pharmacists is not desired, would gradually have a tendency to improve conditions in that respect, and yet not to the extent of conflicting with the views of those who are today opposed to the prerequisite.

Fifth.—Should there be a provision to govern those who would be privileged to act as teachers and instructors in Colleges of Pharmacy? Today it seems that most anyone may teach pharmacy, and its allied subjects, the measure of fitness being left with the person who would teach. The thought has been expressed, that those who would teach should in some manner be required to first prove their qualification.

Sixth.—Should the law prescribe requirements for Colleges of Pharmacy which they would need to meet in order to be recognized by Boards of Pharmacy?

Seventh.—Should the law require all who would dispense medicines to make and keep a record of medicines so dispensed? For instance, third persons can know only what medicines have been given to a patient, when the medicines have been secured from a pharmacist on a physician's prescription. When the physician dispenses his own medicines to his patients, it is altogether impossible for third persons to know what such medicines may have been. It seems in keeping with the public welfare that there should be opportunity in every case to know what medicines may have been given to a patient. The question is, therefore, whether it be deemed advisable that when physicians dispense their own medicines, they be required to make a record of such dispensing.

R. A. KUEVER, Secretary.

#### MEDICINE PIPET HOLDER.

Various holders and bottle attachments for medicine pipets have been devised, but are seldom available when needed.

An efficient holder can be improvised in about ten seconds' time by the use of two common brass pins. The pins are inserted deeply into the cork, parallel with each other and nearly in contact. They will possess spring enough to hold securely an ordinary medicine pipet as shown in the accompanying illustration.—

Dr. H. S. Reynolds, New Haven, Conn., in *Journal A. M. A.*

## Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

#### PHILADELPHIA.

##### FEBRUARY REVIEW OF PHARMACEUTICAL LITERATURE.

It is apparent from a survey of the pharmaceutical journals published during the month of February that original work along pharmaceutical lines has been confined chiefly to researches in pharmaceutical chemistry and botany.

The greater part of the literature published during the month is devoted to drug store business problems and other articles of general interest, either copied or original.

The following abstracts are from original articles appearing in the February issues of the publications mentioned.

#### *Journal of the American Chemical Society.*

G. A. Linhart (page 258) separates mercuric chloride from benzene quantitatively by shaking out the benzene solution with a solution of sodium chloride and precipitating the  $HgCl_2$  from the latter with hydrogen sulphide. This method is stated to be well adapted for quantitative work.

Curtman and Wikoff (page 298), in a paper on "The Detection of Bromides in Presence of Thiocyanates, Cyanides and Ferrocyanides" point out that the presence of the latter substances interferes in the detection of bromides by the ordinary methods, and that from their experiments it is evident that thiocyanates offer the greatest and ferrocyanides the least interference.

A rapid method, taking about 15 minutes, and showing trustworthy results is given,

whereby 2 mgm. of bromine can be detected in presence of 500 mgm. of each of the interfering substances. In the method proposed the interfering substances are precipitated in the form of their cuprous salts by first treating the solution containing them with a saturated solution of  $\text{SO}_2$  and then with double normal  $\text{CuSO}_4$  in excess. The precipitate is separated by filtration and the filtrate is boiled to remove excess of  $\text{SO}_2$  and then treated with triple normal  $\text{H}_2\text{SO}_4$  and 1%  $\text{KMnO}_4$ . Carbon disulphide is added and by shaking out, the presence of Bromine is established.

Another paper of pharmaceutical interest in this issue (page 323), but too lengthy and technical for short abstracting is the one on "Chlorophyll," by Richard Willstätter.

Isolation of chlorophyll and separation into its components; the carotinoids, comparative investigation of leaf pigments and the question of chemical constitution of chlorophyll are considered.

---

*Journal of Industrial and Engineering Chemistry.*

Satow (page 113) has isolated an insoluble, naturally yellow, mordant coloring matter said to be identical with "myricetin," from the bark of *myrica rubra*, and by converting this substance into azo, sulfide and nitro compounds was able to produce other useful soluble dyestuffs.

---

*Journal American Pharmaceutical Association.*

The papers and proceedings of the section on practical pharmacy appearing in the current issue are all worthy of attention. In a contribution entitled, "The Relation of Pharmacy to Medicine," A. H. Dewey makes the following interesting distinction between the commercial pharmacist and the professional pharmacist:

"The Commercial pharmacist practices a kind of pharmacy which is wholly independent of the medical profession, while the professional pharmacist practices a kind of pharmacy which is wholly dependent upon the medical profession."

---

*American Journal of Pharmacy.*

The article on natural and synthetic camphor by Percy A. Houseman is very interesting. The author calls attention to the commercial importance of natural camphor to the producing countries, and then takes up its

extraction and refining, properties, uses and chemical constitution. Synthetic camphor manufacture is also discussed and the author believes the future of this industry to be quite uncertain, due to the fluctuation in the price of natural camphor and the variation in price and supply of turpentine.

In a paper on Arsenic antidote, by J. W. England, attention is called to the importance of the suggestion for using magma magnesiae N. F. in place of magnesium oxide in the preparation of the official arsenic antidote.

---

*Western Druggist.*

A practical paper in this issue (page 34) is the one by P. J. Jacobs entitled, "Preparing a Proof of Loss by Fire," in which attention is called to the importance of druggists being prepared to face loss by fire and having all the necessary information tabulated when claiming insurance. A hypothetical case is used for purposes of illustration, and all necessary figures are given.

---

*Practical Druggist.*

Walker and Klein (page 27) describe a test which aids the diagnosis of cancer and sarcoma. The urine of the patient is treated with tenth-normal iodine solution and  $\text{HCl}$ , and the color obtained is compared with a previously-prepared standard. A marked difference in color from that of the standard is said to indicate an advanced state of the disease, while slighter color variations indicate incipency or less advanced stages.

---

*Bulletin of Pharmacy.*

An interesting contribution to historical pharmacy may be found on page 68, under the title, "What the Drug Business has Come From."

Prescription pricing is the title of a paper found on page 80, and presents the views of several druggists on the prices that are and should be received for medicines by the retailer.

---

*National Druggist.*

An editorial on "The Ownership of the Prescription" states that "the right to possess it lies consecutively with the individuals in whose hands it reposes at the various stages of its career." This would seem to make the pharmacist the final and permanent possessor of the prescription.

Some good suggestions, which are also

timely, are contained in the article on "Easter Trade," by Edgar L. Mills (page 50).

---

*Spatula.*

"Pharmacy in Europe" is the title of an interesting story describing a traveler's experiences in the pharmacies of England, Holland, Sweden, Norway, Denmark, Germany, Belgium, France, and Italy.

---

*Pharmaceutical Era.*

Felix J. Koch (page 57) discusses in detail the sources and cultivation of our saffron supply and the government investigations with regard to its adulteration.

---

*Chemist and Druggist.*

Pharmacists' activities in the European war are receiving considerable attention in the pharmaceutical journals of the various belligerent nations.

It is significant to note that few serious epidemics are reported. The Chemist and Druggist (page 258) reports that the word Aspirin has been removed from the British Trade-marks Register, so that anyone may use this name.

The various local associations are discussing the revision of the British Pharmacopœia and many adverse criticisms are being made. English pharmacists, speaking generally, are not satisfied with the revision and the dissatisfaction is partly explained by the fact that pharmacists have had no part, officially, in the revision.

An interesting brief (page 201) regarding antimony brings out that there is ground for believing that a good deal of the metal contracted for shipment to the U. S. from Europe will not be shipped, owing to the present scarcity.

---

Canadian Pharmaceutical Journals are protesting against the war tax on proprietaries which has recently been levied by the Canadian government.

The Canadian Pharmaceutical Journal, in commenting on the tax says, "Why tax the baby's cough syrup and pass over the young man's favorite brand of chocolates?"

The tax according to this journal is from 10 to 12% specific, taking away practically the entire retail profit on patent medicines.

---

*American Druggist.*

An article by Wilhelm Bodemann (page

48) and editorial comment sound a note of warning against making graduation from a high school a pre-requisite for entrance to colleges of pharmacy and ultimate registration. An article (page 52) describing methods of collecting outstanding accounts and including a set of letters used for requesting payment without hurting the feelings of the debtor should be of considerable interest to the retailer who has a credit business.

---

*Midland Druggist.*

An editorial (page 47) on "Accuracy in Pharmaceutical Spelling" criticises board members and teachers for laxity in regard to spelling pharmaceutical names and urges preceptors to insist on proper spelling by their apprentices.

---

*Merck's Report.*

A paper on sugar cane by R. I. Geare (page 28) of Washington, D. C., takes up some of the requirements for the proper cultivation of this plant in the United States and emphasizes particularly the use of the proper kind of fertilizer to furnish potash, phosphates and nitrogen, which are essential to its successful growth.

---

*The Druggists Circular.*

Spurious Drugs (page 87) is the title of a paper by John Uri Lloyd, dealing with adulterants found in some crude drugs. The author takes the attitude that ignorance on the part of collectors and others is often responsible for the admixture of crude drugs having similar characteristics.

Proper instruction of those in charge of collecting drugs and remuneration corresponding to the responsibilities involved, are offered as suggestions for preventing this unintentional adulteration.

In conclusion, the author states that the American drug market presents a deplorable uncertainty that can be overcome only by the means just suggested and can be materially improved by employing experts to purify our native *materia medica*.

ROBERT P. FISCHER, B. Sc., Ph. D.

<>

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held on Tuesday evening, April 13, at the Medico-Chirurgical College. In the absence of the president and vice-president, Prof. C. H. LaWall was ap-

pointed chairman pro tem and he called the meeting to order at 8:30 p. m. The minutes of the last meeting were read and approved.

The committee, appointed at the March meeting to audit the treasurer's accounts, reported them to be correct.

Under the head of new business the following communication was read:

April 12, 1915.

Secretary Philadelphia Branch, A. Ph. A.:

Dear Sir—Inasmuch as the time which elapsed between sending the reply to the Pearson article, to the Council of the A. Ph. A., and its receipt from them, was so great, and taking into account the number of adverse comments which were received regarding it, I feel that it should be withdrawn and do so move, with the approval of the committee to whom was entrusted the task of drafting it.

Very truly yours,

(Signed) C. H. LAWALL.

Mr. Apple moved that the reply to Pearson's Article—Pills and Piracy—be laid on the table. The motion carried.

The program of the evening was then taken up and Mr. Joseph Rosin read Dr. Rosengarten's paper on "The Standards and Tests for Organic Chemicals in the U. S. P. IX."

Mr. George M. Beringer gave a comprehensive survey of the new features of "The Extracts, Fluidextracts and Tinctures of the U. S. P. IX."

"The Current Review of Pharmaceutical Journals" was presented by Prof. E. Fullerton Cook, after which the meeting adjourned.

J. ED. BREWER, Secretary.

<>

#### CHICAGO.

The April meeting of the Chicago Branch of the American Pharmaceutical Association was held the evening of April 26 at the Kuntz Remmler restaurant, following a complimentary dinner to Professor Joseph Price Remington. A large attendance was had.

James H. Wells reported for the legislative committee that the various bills before the Illinois Legislature amending the Pharmacy law were making some progress, but stated that, because of the greatly overcrowded condition of the legislative calendar, much pressure would have to be brought to bear to get a hearing and vote on the pharmacy amendments.

William Gray reporting for the Committee on Practical Pharmacy read a very interest-

ing instructive paper on the preparation and use of Bang's Solution for the determination of sugar in urine. Mr. Irwin A. Becker also presented a valuable paper entitled, "Some Observations on the new British Pharmacopœia." Mr. Becker discussed at some length the test for free salicylic acid in aspirin on acetylsalicylic acid and by practical demonstration showed the inaccuracy of the test as stated in the British Pharmacopœia.

Charles Orr, employed as pharmacist by the Illinois Central Railroad Company, read a most interesting paper on "The Opportunities of a Pharmacist in Railway Hospital Work."

The three papers were well received and by motion were ordered presented to the Publication Committee of the Association for publication in the Journal, if desirable.

Professor Remington was enthusiastically received after a characteristic introduction from President Craig. Professor Remington presented various phases of the work in the new U. S. Pharmacopœia, especially the subjects of liquid petrolatum, whiskey, patented chemicals, adrenalin, etc. He exhibited the page proof of the first hundred pages of the new book and named October as the month in which he expected it to be on the market.

The discussion that followed was most instructive and the reminiscences most entertaining. Professor W. B. Day moved a vote of thanks and Mr. George P. Englehard offered a touching tribute to Professor Remington's character and his great gifts to pharmacy.

<>

#### BALTIMORE.

The April meeting of the Baltimore Branch of the American Pharmaceutical Association was held Wednesday evening, April 21, in the Hynson, Westcott & Company assembly room at Charles and Franklin Streets, with President E. W. Hodson in the Chair.

The regular program included:

Some Notes on Glucosides, by Dr. Herman Englehardt.

Some Dispensary Observations, by Miss Carrie G. Mossop.

Little Journeys Through the Journals.

Doctor Englehardt read a paper on the "Synthesis of Glucosides," which was very interesting and instructive and of considerable educational value.

By the vote of the branch it was referred to the Journal for publication as a paper

coming through the branch to the Association.

A brief synopsis follows:

#### SYNTHESIS OF GLUCOSIDES.

After discussing the properties of glucosides and the action of the enzymes in general, a few methods for isolating glucosides were given. The earlier work done by Schützenberger, Michael, Schiff and Fischer was discussed and finally the important work done by Bourquelot and his associates and pupils was reviewed.

Bourquelot's method for synthesizing the glucosides differs entirely from the methods applied by the above-mentioned investigators and depends on the fact that enzymes have the power not only to hydrolyze glucosides, but also to reconstruct them from the products of hydrolysis. Some of the glucosides prepared synthetically by the last mentioned method were then discussed. Finally the great importance which the enzymes and glucosides have in biochemical synthesis was mentioned and also the importance of synthesis and hydrolysis for the life of the plants.

Miss Mossop read a paper on "Dispensary Observations," which she prefaced by remarking that Doctor Hynson once told us that the pharmacist is a kind of triangle, the three sides being professional, commercial and social, and that she had chosen one division of the social side and would endeavor to tell of some of her observations of human nature at the free dispensary.

Although her paper was not along the scientific or ethical lines indicated in the program, yet it certainly did indicate that she had absorbed and observed as she went along and that her experiences in her sociological work among the classes met with in dispensary patients, were well worth recording and reading.

They were very much enjoyed and they could be printed in the Journal to edify those of us who have not been introduced to this side of our calling.

Extremes in appearance were cited in which some endeavored to "put up as good a front" as possible, and others to appear extremely shabby, some men going to the trouble to remove collar and tie outside of the dispensary door and hide them in their pockets.

The dependence of the genus male of the Ethiopian clan on the "Female of the Spe-

cies" is strikingly brought out there, as she invariably brings him and tells all of his troubles, he saying nothing unless asked or prompted by her.

The gratitude of some is shown in their kissing the hands of all who have served them, in bringing little presents of flowers and in many other touching ways.

Some are grafters and want something besides what is prescribed and sometimes will offer half the charge for a regular prescription to get it and occasionally, even more.

Some of the journals were considered and some of the articles were discussed.

A book on prescription writing, given as a premium by one of the pharmaceutical journals was introduced by Doctor Hynson as one containing horrible prescriptions and worse pharmacy.

During the discussion which followed, the necessity of education along the lines of pharmaceutical Latin was emphasized and the disparity between the "Dog Latin" of American pharmacy and American prescriptions and the good Latin of that of Europe was brought out.

The same difference was pointed out between the Latin of the prescriptions appearing in American pharmaceutical and American medical journals, although the Latin of the average prescription is awful.

The discussion resulted in a motion being carried that "It is the sense of the Branch that in an effort to improve the Latin of prescriptions, that the pharmaceutical journals should edit the prescriptions appearing in them."

In calling back to a physician, a prescription received over the telephone, it was felt that, unless the pharmacist knew his Latin, it would be best to repeat it in good English rather than in bad Latin.

WM. J. LOWRY, JR., Secretary.

<>

#### NEW YORK.

Minutes of the regular meeting of the New York Branch of the American Pharmaceutical Association held in the New York College of Pharmacy Building, March 8, 1915, President Roemer in the Chair.

Minutes of the preceding meeting were adopted as read.

Treasurer's Report: Read and received with thanks.

The member of the Council, Mr. McEl-

henie was not present and no report was received.

#### REPORTS OF COMMITTEES.

**Membership:** Chairman Rehfuess being absent no report was received.

**Legislation and Education:** Chairman Anderson presented a very detailed and interesting report concerning local, state and national legislative matters. Among other things he called attention to the ruling of the Commissioner of Internal Revenue that druggists must keep a record of narcotics used in manufacturing preparations, claiming that this was beyond the Commissioner's authority. Novocain is exempted from the provisions of the act.

Attention was directed toward the various bills introduced at Albany that have any bearing upon the drug-trade.

**Fraternal Relations:** Chairman Berger absent. No report.

**Progress of Pharmacy:** Chairman Dickman read an interesting report presenting numerous abstracts from various publications. Calmonal, a calcium-bromide-urethan compound is recommended as a hypnotic without narcotic effect. Durolit is a lacquer prepared according to a patented process and is said to resist hot solutions of alkalis. Normal opium is the name suggested for opium containing definite quantities of morphine, codeine, narcotine and meconic acid. Professor Kobert-Rostock states in the *Phar. Zentral-halle* that he considers artificial camphor free from poisonous properties. A long list of specialties were also included in the report.

A communication from Mr. C. A. Mayo was read requesting that the Branch send delegates to the N. Y. Pharmaceutical Conference and asking for financial support. The communication was received and motion carried that the president appoint three delegates.

A communication from President Roemer suggesting semi-monthly meetings was received and the secretary was ordered to embody the suggestion in the notices for the next meeting.

President Roemer presented for membership the name of S. Meyer of College Point, and he was duly declared elected.

Several representatives from the Board of Health and the Bureau of Standards were present and a discussion of the "Standardization of Pharmaceutical Graduates" resulted in the president being empowered to appoint a

committee to further consider the matter. The resolution follows:

Be it resolved, that the New York Branch of the American Pharmaceutical Association approves of the spirit of the suggested standardization of graduates as proposed by the Bureau of Standards of the New York Board of Estimate and Apportionment and that the president appoint a committee of three to discuss the matter with the representatives of the Bureau.

Dr. R. P. Fischelis then read a paper entitled, "A Plan for a More Serviceable A. Ph. A. Journal." The paper called for considerable favorable discussion and it was referred to the Committee on Publication with the approval of the suggestions by the Branch.

Professor Otto Raubenheimer then read a paper entitled, "A Review of the British Pharmacopoeia." Owing to the late hour, Prof. Raubenheimer limited his remarks. After calling attention to various changes the author expressed the opinion that the work was not as good as it ought to be.

The attention of the Branch was directed to the fact that the U. S. P. Revision Committee had decided to adopt the term "mils" in place of "cc.," and the following resolution introduced by President Mayo of the parent body was unanimously adopted:

Be it resolved, that the New York Branch protests against the adoption of the term "mils" for "cc.," and that the Chairman of the Revision Committee of the U. S. P. call for another vote on the question.

JEANNOT HOSTMANN, Secretary.

#### PITTSBURGH.

At the meeting of the Pittsburgh Branch held Friday evening, April 16th, the members and visitors were given a rare treat in listening to the paper presented by P. Henry Utech, of Meadville, Pa., on the subject, "An American Pharmacist in Germany," based upon his experiences as a member of the party of pharmacists that visited Europe last summer under the auspices of the German Apotheker Society, of New York, which was suddenly terminated when about half the itinerary had been covered on account of the breaking out of the war. Mr. Utech covered more than one hour, every minute of which was filled with interesting and instructive, as well as amusing accounts of men and things pharmaceutical encountered on his travels. We

would be glad to give a full reproduction of the paper in these columns, but space, and the rules of the American Pharmaceutical Association, forbids, so we must content ourselves with but a brief epitome:

"The German Apotheker is proud of his profession, which carries with it a certain prestige and distinction, and endeavors always to the best of his ability to live up to the precepts and principles which his predecessors have handed down to him—principles which serve as a beacon light on his high road to success. To become an Apotheker in Germany one must undergo a long, tedious process of study and training; he must assure the government of his fitness through a thorough examination. When an early member of the famous family of Merck, Johann Justus Merck entered upon his four years of apprenticeship in the Royal Court Pharmacy in Dresden, in 1741, among his other duties the following was exacted of him: "He was required above all things to respect God and His holy word, to hear the latter with pleasure and to pray morning and evening. He was to have no money in his possession and to keep free from all frivolous and luxurious habits."

In Darmstadt is located the plant of these chemical manufacturers known throughout the world—Merck's. This business was founded in 1668 as a small pharmacy by Frederick Johann Merck, this pharmacy has ever since been in continuous possession of the Merck family, and is still in operation under the name of "The Engel Apotheke," conducted by Dr. Emanuel August Merck, who is also one of the joint owners of the extensive chemical plant. The present plant occupies an area of about 75 acres, and is situated one mile north of the city of Darmstadt, and consists of 204 separate buildings. In equipment it affords a striking illustration of every latest appliance that man's ingenuity has evolved, and every possible protection is provided for its employees. It is surrounded by a colony of model dwellings for its working people, has an electric station, gas plant, and water works. There are old age pensions, allowances for heads of families during illness and a small donation of money each time a new member arrives in the family.

Since the European war has begun we as pharmacists have been brought face to face with the stern realization of our dependence

upon the warring nations for many of our supplies. One of our American drug journal editors has called attention to the fact that "we as a nation consume more and produce less drugs than any other country on the globe."

Among the many peculiarities that Mr. Utech noted that differ from usage in this country are that prescriptions are always returned to the patient after filling; all liquids are dispensed by weight; graduates are but rarely met with; poisons are kept in closets with always more than one and frequently as many as three locked doors to open before gaining access; patent medicines are sold only under a special license; drogeries handle toilet articles, sundries, soaps, perfumes, rubber goods, etc., but are not permitted to dispense drugs nor compound prescriptions, that being the business of the apotheker in which he is protected by the government, and it permits of no competition up to a population of ten thousand.

At the conclusion of Mr. Utech's paper, Dr. J. A. Koch, who spent six months in Dresden as a student, gave some interesting and amusing instances of famous men and noted places which Mr. Utech had mentioned in his paper. In all this was the most enjoyable evening's entertainment the Branch has ever enjoyed.

Mr. Campbell emphasized the importance of the Question Box feature of the Branch meetings, and said more use should be made of it by pharmacists with problems to solve, and presented several questions himself covering some of the proposed additions to the new pharmacopœias which he proposed be embodied for discussion in the program for the May meeting.

Dr. A. F. Judd requested the members to secure for him samples of "Cream Tartar" from different drug stores, as well as groceries, to assist him in work he has in hand covering conditions as to quality and prices in the open market of that article.

During the meeting, Dr. J. H. Wurdack announced the sad news that Dr. Emile F. Krapf, whose lecture on Radium delivered at the February meeting and which had attracted wide attention, had died on April 9th, after a short illness with pneumonia. Dr. Krapf was a young man and gave promise of having a brilliant future.

B. E. PRITCHARD, Secretary.

## SAINT LOUIS.

Dr. J. A. Warner gave a stereopticon lecture on "The Manufacture of Antitoxic Sera," and Dr. J. C. Falk a talk on the subject, "Why Physicians Should Prescribe," before the April 16th meeting of the Saint Louis Branch of the American Pharmaceutical Association.

The following participated in the discussion: J. J. Hoelscher, E. A. Sennewald, Dr. Gustav Rehfeld, G. T. Lehmberg, J. A. Morlan, Julius C. Hoester, J. W. Mackelden, C. H. Bierman, Grace Steingardt, Lydia F. Batdorf, Gustav Kring, Dr. W. P. Henrich, J. M. Good, Herman J. Couch, J. T. Walsner, Chas. H. Horton, Dr. J. C. Falk, W. K. Robinson, W. E. Crampsey, Dr. J. A. Warner, C. T. Buchler, C. Francis Sennewald, Dr. H. M. Whelpley, Chas. Gietner.

General Secretary William B. Day, Treasurer H. M. Whelpley and Editor E. G. Eberle spent several days in St. Louis discussing Association matters, and more particularly with regard to the Journal.

Monday noon, April 5, Dr. Whelpley guided the other two members of the delegation towards a place where strength might be developed by partaking of food. Instead of a quiet lunch the visitors were agreeably surprised by a company of about forty St. Louis pharmacists; with few exceptions, members of the local Branch, and the others so near, that the San Francisco meeting will not pass by without their accession. The hour was passed socially while enjoying the surprise dinner. At night, Dr. H. M. Whelpley, Professor Day and E. G. Eberle were guests of Dr. Charles E. Caspari at the University Club.

JULIUS C. HOESTER, Secretary.

## CINCINNATI.

The regular monthly meeting of the Cincinnati Branch, A. Ph. A., was held April 15, 1915, at Lloyd Library. President E. H. Thiesing presided.

The reading of the minutes of previous meetings and the reports of committees having been disposed of, the President introduced Mr. Louis Werner, Jr., who gave a very interesting talk on "New Organic Metallic Compounds," in which he demonstrated the formation of many compounds; such as

Acetphenetidin from the Benzene Series, the formation of Salvarsan and many others. An interesting discussion followed in which Mr. F. W. Weismann, Prof. C. T. P. Fennel and others participated. Mr. Weaver was warmly commended by the members for his excellent paper, after which President Thiesing introduced Professor John Uri Lloyd, who spoke on "Lloyd's Alkaloidal Reagent," giving experimental demonstration. He demonstrated his reagent: "Hydrous Aluminum Silicate," for example with powdered Sanguinaria, treating same with acidulated water, dividing the filtrate into two portions and treating one portion with the reagent; the colorless filtrate of which shows an absolute absence of the active principle of sanguinaria, giving positively no result with Mayers' Reagent for alkaloids. He shows how all alkaloids may be removed by Lloyd's Reagent. The Professor's investigations have extended over a period of forty years, and he believes that this is a beginning of a new era of organic and analytical chemistry, laying particular stress upon the experiments in Colloidal Chemistry, so well illustrated by Dr. Oswald and others.

The discussions which followed Professor Lloyd's lecture was participated in by Mr. Chas. G. Merrell, Professor C. T. P. Fennel, Professor Theo. D. Wetterstroem, and others, one claiming "it is a matter of adhesion, that charcoal may have the same adsorption," or, again, "I do not believe in colloidal action, but in catalytic action," but all agreed upon the absolute practical results shown by Lloyd's Reagent.

Professor Lloyd was tendered a rising vote of thanks by his appreciative auditors.

CLAS. A. APMEYER, Secretary.

## NORTHWESTERN BRANCH.

The March meeting of the Northwestern Branch of the American Pharmaceutical Association was held at the Nicollet Hotel, Minneapolis, Thursday evening, March 18, 1915. The meeting was preceded by a dinner and a brief business session of the Minneapolis Retail Druggists' Association. As this was the annual meeting of the Branch, reports were received from the various officers, and the annual election took place. Secretary Newcomb reported briefly upon the work of the past year and referred to the sixteen

new members acquired by the branch since the last annual meeting.

The Nominating Committee reported the following names as nominations for office during the coming year: President, A. D. Thompson, Minneapolis; Vice President, Truman Griffen, Minneapolis; Secretary-Treasurer, E. L. Newcomb, Minneapolis; Executive Committee, F. A. U. Smith, St. Paul; F. M. Parker, St. Paul; S. W. Smetana, Hopkins; A. J. Kline, Minneapolis. The names as presented by the committee were unanimously elected.

By motion the Branch voted an assessment of \$1 upon each active member to defray the expense of the secretary in connection with the sending out of meeting notices, etc.

Communications were read concerning the preliminary report of the Transportation Committee and copies of the report were distributed among those present.

The Branch concurred in the resolution concerning the death of Mr. Frank W. Klenert, adopted earlier in the evening by the Minneapolis Retail Druggists' Association.

The regular program for the evening, which was carried out, was as follows:

1. The Assay of Spiritus Aetheris Nitrosi and Acidum Hydrochloricum Dilutum, with demonstrations. By Prof. G. Bachman.

2. A continuation of the discussion on Spiritus Aetheris Nitrosi, Acidum Hydrochloricum Dilutum, etc., begun at the Scientific Section meeting of the Minnesota State Pharmaceutical Association. The best methods for the preparation and preservation of the above named products.

3. Latest rulings on the Harrison Anti-Narcotic Law.

4. The State Anti-Narcotic Bill and its provisions.

Professor Bachman's demonstration of the assay of Spirit of Nitrous Ether was highly appreciated by the members present and elicited many questions. The apparatus designed by Prof. Frank N. Moerck was exhibited and its use demonstrated. Prof. Bachman submitted the following concerning this preparation and urged each pharmacist to give strict attention to this preparation in order that the physician may obtain the result which he has a right to expect:

1. Do not make up more than the quantity sold within a month. Buy the concentrated

Spirit, preferably in hermetically sealed tubes. The contents of one of which will make a pint of Sweet Spirit of Niter.

2. Keep the Spirit in completely filled bottles in such sizes as are usually called for by the trade and these stored in a cool place protected from light.

3. Air space in the bottle has much to do with the decomposition of the Spirit.

4. Do not expose the Spirit to sunlight as this is one of the chief causes of decomposition.

5. Amber colored bottles afford good protection.

The paper by Prof. Bachman was discussed by Messrs. Griffen, Frost, President Thompson, Dean Wulling, Schmidley, Kline, Danek and others. Mr. F. A. U. Smith explained in detail the reason why amber colored bottles afforded a protection to the substances contained therein, which are susceptible to the actinic rays of light. Attention was called to the indiscriminate use of blue bottles for preparations which should receive the greatest protection from chemically active light rays.

Following the discussion of Sweet Spirit of Niter, the matter of a joint meeting between Twin City physicians and Twin City pharmacists was brought up and after discussion, the following motion was unanimously passed: "Moved by Dean Wulling, seconded by Mr. Frost, that the secretary be instructed to communicate with the chairman of the Minneapolis R. D. A. and the chairman of the St. Paul R. D. A. requesting each to appoint one pharmacist, who with a member of the Northwestern Branch, A. Ph. A., to be appointed by the president, are to constitute a committee of three to bring about not later than early May, a joint meeting of pharmacists and physicians of Minneapolis, and later a joint meeting of pharmacists and physicians of St. Paul, the committee to have power to make necessary arrangements."

Mr. John P. Jelinek, chairman of the Legislative Committee of the State Association, spoke on the state anti-narcotic bill and its provisions and urged the support of the Branch for the passage of the bill by the 1915 session of the Minnesota legislature. After some discussion, the bill was endorsed by the Branch.

About 50 attended the dinner and meeting.

## NASHVILLE.

The regular meeting of the Branch was held at Bloomstein's Hall, March 17th. In the absence of President E. F. Trollinger, Vice-President J. O. Burge presided.

Besides the regular members, there were in attendance a number of physicians, pharmacy students and attorneys who had been invited to hear a discussion of several bills relating to pharmacy, which have been introduced at the present session of the Legislature.

Dr. Ruddiman reported that the committee appointed at the last meeting had held a satisfactory conference with Dr. L. P. Brown in regard to amending the State anti-narcotic law.

W. R. White then made a report for the Legislative Committee which showed that bills had been introduced to allow persons who had held permits for four years to become Registered Pharmacists without examination by the Board; to require the dispensing of poisons in triangular bottles only; to regulate the sale of patent and proprietary medicines and toilet articles by requiring registration of the ingredients and therapeutic claims with the State Pure Food Inspector, to whom a special tax must be paid; to make it a felony to advertise or solicit business for a preparation to cure cancer or any other chronic disease; to prohibit the sale of heroin in this state, and to regulate the sale of alcohol by druggists.

After remarks had been made on the various bills by Mr. G. S. Martin, Dr. Holmes, D. J. Kuhn, Dr. E. A. Ruddiman, S. C. Davis, Dr. J. M. Rogoff and W. R. White, expressing the opinion that most of the bills were revolutionary and detrimental to the best interests of pharmacy, a resolution was adopted that the first three bills do not fill the requirements of the conditions and should be rejected. The remaining bills were referred to the Legislative Committee.

Dr. J. M. Rogoff then announced that he would give a series of lectures entitled, "A Scientific Side Line for the Pharmacist," in which he would demonstrate how the druggist can test urine, sputum and other physiological secretions, at Furman Hall, Vanderbilt, under the auspices of the Branch, and invited all who were interested to attend.

W. R. WHITE, Secretary.

## College and Society

### POST-GRADUATE PRIZES IN THE FORM OF A. PH. A. MEMBERSHIPS.

It will no doubt interest the members of the A. Ph. A. to learn that five prizes of nominations to memberships in the Association are offered in the department of Pharmacy of the College of Jersey City.

One is offered by Dr. Otto Raubenheimer, Professor of Pharmacy, and is to be given to the post-graduate student writing a thesis on a pharmaceutical subject. Another is offered by Dr. Joseph Koffler, Professor of Chemistry, and is to be awarded to the post-graduate student writing the best thesis on a chemical subject. The other is offered by Dr. Jacob Gutman, Professor of Physiological Chemistry and Clinical Microscopy, for the best thesis on that subject. Still another is offered by Dr. Felix von Oefele, Director of the Department of Balneology and Krunotherapy for the best thesis on a subject pertaining to this department. Last, but not least, in order to arouse more interest in Pharmaceutical History, Professor Otto Raubenheimer has offered another prize for the best thesis, written on that particular subject.

Another requirement is that besides the writing of the thesis the same also has to be properly defended before the faculty. Besides the one-year's membership in the A. Ph. A., a Certificate of Excellence issued by the Association and properly engrossed will also be awarded.

The Journal will be glad to learn of A. Ph. A. memberships offered by Colleges of Pharmacy for mention in these columns.

<>

### NORTHWESTERN UNIVERSITY SCHOOL OF PHARMACY EXTENDS COURSE.

Northwestern University School of Pharmacy announces that beginning with the session of 1945-1946 the course for the degree of Graduate in Pharmacy will occupy two years of thirty-two weeks each; and the course for the degree of Pharmaceutical Chemist will occupy three years of thirty-two weeks each.

THE COLLEGE OF PHARMACY OF  
THE UNIVERSITY OF MINNESOTA.

Although the student-body of the College of Pharmacy of the University of Minnesota has for some years now been made up almost wholly of high-school graduates, high-school graduation has not heretofore been an inflexible requirement for entrance because of the desire of many Minnesota pharmacists that entrance requirements be maintained at less than a high-school qualification. It is very gratifying to be able to announce now that recently the Minnesota State Pharmaceutical Association approved the standing recommendation of the pharmacy faculty that a high-school training or an equivalent be made a prerequisite to entrance upon the study of pharmacy at the University of Minnesota. Acting upon this approval of the Association the University Regents have enacted the existing entrance conditions into requirements, so that the entrance qualifications to the College of Pharmacy of the University are now formally placed at a high-school training or an equivalent.

&lt;&gt;

NORTH CAROLINA PHARMACEUTICAL  
ASSOCIATION.

The thirty-sixth annual meeting of the North Carolina Pharmaceutical Association will be held in Durham on the 15, 16, 17 of June, 1915.

An exceptionally large attendance at the meetings is expected this year because of two factors which tend to make successful conventions: First, the traveling men have organized into an Auxiliary of the Association and are going to assist in making the Durham meeting a success from an entertainment standpoint, and second the city of Durham is in the central part of the state and is easily reached from all parts of North Carolina. Then too, the local druggists are well organized, are enthusiastic over the approaching meeting, and promise to do everything possible to make things pleasant for the visiting druggists.

Mr. P. W. Vaughan, for thirteen years general secretary of the N. C. P. A., was elected local secretary at the Hendersonville meeting. Those familiar with Mr. Vaughan's deep interest in the Association and his previous record as secretary will anticipate a most successful convention.

Durham is one of the largest, if not the largest, smoking tobacco manufacturing

towns in the world. It will prove a matter of great interest to take a trip through the large factories engaged in making such popular brands of "smokes" as "Bull Durham," "Duke's Mixture," "Fatimas," "Piedmonts," etc., etc., since the various processes involved are intricate, yet wonderfully fascinating.

Mr. G. C. Goodman, of Mooresville, will preside over the meetings. A number of important matters will be brought to the attention of the members. It must be, it *will* be, the best meeting in the history of the North Carolina Association.

J. G. BEARD, Secretary.

&lt;&gt;

NORTH CAROLINA SCHOOL OF  
PHARMACY.

Another public service feature has been added by the University of North Carolina for the benefit of pharmacists throughout the state. This feature is the establishment of a Bureau of Employment which is conducted under the direction of the School of Pharmacy, by the assistant professor of pharmacy, J. G. Beard, who is also secretary of the North Carolina Pharmaceutical Association.

This bureau meets a long-felt demand of the North Carolina pharmacists, as it offers a means whereby proprietors may secure clerks and clerks can locate positions without any expense to either party. No charge will be made for any service rendered by the bureau.

&lt;&gt;

UNIVERSITY OF ILLINOIS SCHOOL  
OF PHARMACY.

The members of the senior class had the pleasure of listening to two excellent lectures on the subject of "Antitoxin and Vaccines," and the second on the subject of "Physiological Testing." These were given by Mr. O. V. R. Smith, of Parke, Davis & Co.

The annual banquet of the Alumni Association was held at the Congress Hotel, Wednesday evening, April 28. Prof. Joseph P. Remington, President James, members of the faculty and members of the Alumni responded to toasts. The members of the class of 1890 celebrated their silver anniversary by attending this banquet. The graduating class, the largest in the history of the school, were the guests of the Alumni on this occasion.

Professor Day recently made an address before the evening classes of the Young Men's Christian Association at the Division Street Branch on the subject of "Pharmacy as a Profession." This was one of a series

of lectures intended to aid the young men in selecting a career.

Mr. William Loesch, of the Public Drug Company, Chicago, has presented to the School of Pharmacy a second lot of about one hundred text and reference books on pharmacy, chemistry, botany and materia medica.

The senior students recently visited the laboratories of Bauer & Black and were shown the process of making absorbent cotton, medicated gauzes and adhesive plasters. The excursion was in charge of Professor Snow. <>

PROFESSOR BEAL TO ADDRESS  
ILLINOIS PHARMACISTS.

A notable feature of the coming convention of the Illinois Pharmaceutical Association, which is to be held at Springfield, June 15, 16 and 17, will be an address by Prof. James Hartley Beal. The officers of the Association are very much pleased to have Professor Beal's acceptance of their invitation to address the convention, especially in view of the fact that Professor Beal comes to the Association as an adopted son of Illinois, since he has made his home at Urbana. Professor Beal's long experience in Association activities, no less than his legal training and his participation in the framing of the Harrison Bill and other important legislation, make his accession to the Illinois Pharmaceutical Association most important and timely. It is the hope of the officers of the Association that an unusually large number of members will avail themselves of this opportunity to hear Professor Beal and welcome him to the Illinois Pharmaceutical Association. <>

A CORRECTION.

I notice an error in the article on cigarettes as published in the April issue of the Journal.

I find the error was in copying the "Analysis of Cigarette Papers." The total ash in the Austrian papers should be 1.95, and in the French 5.12, and the correction would read as follows:

Ash	1.95	5.12
Calcium oxide	88.80	81.02
Magnesium oxide	1.00	1.68
Iron, alumina and silica oxides	6.15	2.15

You understand the ash is made up of calcium, magnesium, etc., as stated in percentage, but the total ash is as above and not 88.80 and 81.02.

AZOR FULTON.

The Pharmacist and the Law

STATE ANTI-NARCOTIC BILL.\*

Prepared at the request of the Executive Committee N. A. R. D., by Messrs. J. H. Beal, F. H. Freericks and Hugh Craig.

A BILL

To Provide Against the Evils Resulting from the Traffic in Certain Habit-Forming Narcotic Drugs, to Regulate the Sale and the Having in Possession of Such Drugs, and Providing Penalties for the Violation Thereof.

Be it enacted, etc.

Section 1. It shall be unlawful, except as hereinafter provided, for any person to have in possession, or to deal in, dispense, sell, or otherwise dispose of any opium or coca leaves, alpha- or beta-eucaine, or any compound, manufacture, salt, derivative, or preparation thereof, or synthetic substitute therefor.

Proof of the possession of any of the substances enumerated in this section shall be construed as *prima facie* evidence of dealing in the substances so possessed.

Provided, That nothing contained in this section shall be construed to apply:

(a) To decoctanized coca leaves or preparations made therefrom which do not contain cocaine, or to chemical constituents or derivatives of opium or coca leaves or of their alkaloids which do not possess narcotic or habit-forming properties.

(b) To the possession of any of the above-mentioned substances by licensed physicians in connection with the practice of medicine or surgery; by licensed dentists in connection with the practice of dental medicine or surgery; by licensed veterinarians in connection with the practice of veterinary medicine or surgery; by licensed pharmacists in connection with the practice of pharmacy, by hospitals or similar institutions, when intended exclusively for the treatment of patients in said hospitals or institutions; by manufacturers; by wholesale druggists, or by colleges, scientific or public institutions when intended exclusively for educational, scientific or public purposes, provided that all such hospitals or similar institutions, wholesale druggists or

\* The bill adds no additional burdens, as it corresponds with the Harrison Law.

manufacturers have been duly authorized or licensed in accordance with Section 3 of this act.

(a) To the possession of any of the above-mentioned substances by a common carrier for delivery to a specified consignee; by a warehouseman holding possession under the direction of the owner thereof; by the agent or employe of a principal authorized by law to possess the same when such agent or employe is acting within the scope of his employment in the conduct of a lawful business; or by duly authorized officers of the law when obtained and possessed for the purpose of discharging any duty imposed by law.

(d) To the possession of any of the above-mentioned substances which have been dispensed by a licensed physician, dentist, veterinarian, or pharmacist, in conformity with the provisions of this act, when possessed in a container which is labeled in conformity with the provisions of this act.

(e) To the possession by consumers or the possession or sale by retail dealers licensed by the Board of Pharmacy in conformity with Section 3 of this act, by manufacturers, wholesale druggists, licensed pharmacists, physicians, dentists or veterinarians, of bonafide medicinal preparations intended for internal use which do not contain in one fluid-ounce or in one avoirdupois ounce, separately, more than two grains of opium or the extractive of two grains thereof, or more than one-fourth grain of morphine or any salt thereof, or more than one-eighth grain of heroin or any salt thereof; or of bonafide medicinal preparations suitable for external use only which do not contain cocaine, or alpha- or beta-eucaine, or any salt or derivative thereof or synthetic substitute therefor; *provided*, that all such preparations shall contain other active drugs in sufficient proportion to confer upon them other and additional medicinal properties than those possessed by the unmixed drugs, salts or derivatives named in this section; *and provided further*, that all such preparations are possessed, sold or otherwise disposed of solely for use as medicines and not for the purpose of evading the intentment of this act.

(f) To the sale or other disposal of the substances enumerated in this section by manufacturing pharmacists or chemists, wholesale druggists or licensed pharmacists, to manufacturers, wholesale druggists or licensed pharmacists, or to licensed physicians,

surgeons, dentists, or veterinarians, or to hospitals or similar institutions, colleges or public institutions: *Provided*, That a record of every such sale or disposal, showing the date of the transaction, the names and addresses of the parties thereto and the names and quantities of the substances so transferred be made and kept on file by both parties to the transaction for two years, open to inspection by duly authorized officers of the law; *provided also*, that the making and preserving of any order or duplicate, or of any record required by any other law to be made and preserved, which order, duplicate or record shall set forth the facts above required to be stated, shall be deemed a satisfactory compliance with the provisions of this paragraph.

Whenever required so to do by the authorities charged with the duty of enforcing the provisions of this act, any person possessing, selling or distributing any of the substances enumerated in this section shall render an itemized statement, verified by affidavit, of all such substances received by him within the ninety days next preceding the date of such request, including the names of the persons from whom received, the date when received, and the quantity in each instance received.

(g) To the sale or other disposal to a consumer of any of the substances enumerated in this section, by a licensed pharmacist pursuant to the written prescription of a licensed physician, dentist, or veterinarian. *Provided*, That with the exception of any prescription for a preparation which is exempted under paragraph (e) of this section, such prescription is dated as of the day on which it was written, bears the signature and address of the prescriber and the name of the person for whom the substance is intended; or if intended for a lower animal, shall state the kind of such animal and the name of the owner thereof; *provided further*, that such prescription when compounded or dispensed shall be serially numbered, dated, and filed by the compounder, and be retained on file for two years open to inspection by any duly authorized officer of the law; *and provided further*, that no such prescription shall be filled more than once, and no copy of such prescription shall be given to any person, except to the original prescriber or to a duly authorized officer of the law for use in connection with the enforcement of this act or of any other law; *and provided further*, that the medicine dispensed upon such prescription shall be delivered in a container which is labeled with

the serial number of the prescription or the name of the substance, the date when dispensed, the name of the person for whom intended, or if intended for a lower animal, with the kind of such animal and the name of the owner thereof, the name of the prescriber, and the business name and address of the establishment from which dispensed.

(h) To the administration, sale or other disposal, except as hereinafter provided, of any of the above-mentioned substances by a licensed physician or licensed dentist to a patient upon whom he is in professional attendance, or to the administration of such substances to a lower animal and not to a human being by a licensed veterinarian: *Provided*, That such licensed physician, licensed dentist or licensed veterinarian, shall keep a record of the name and address of the patient, or, if intended for a lower animal, of the kind of animal and the name and address of the owner thereof, the date of the sale or other disposal, and the name and amount of the drug transferred, in every such instance as he may dispose of otherwise than by direct administration to a patient, more than six grains of opium or the extractive of six grains thereof, or more than one grain of cocaine, or more than one grain of morphine, or more than four grains of codeine, or more than one-half grain of heroin, or of any salt or derivative of, or synthetic substitute for, any of the foregoing substances. The record so made shall be preserved on file for a period of two years and be open to inspection by any duly authorized officer of the law, and except when administered directly to a patient, all such substances shall be delivered in a container which shall be labeled in conformity with the provisions of paragraph (g) of this section.

*Section 2.* It shall be unlawful for any licensed physician, licensed dentist, or other person to furnish to or prescribe for the use of any habitual user of the same any of the substances enumerated in Section 1 of this act, or for any licensed dentist to furnish or prescribe any of the said substances for the use of any person not under his immediate treatment as a dentist or for any other purpose than as a part of such treatment, or for any veterinarian to furnish or prescribe any of the said substances for the use of any human being.

The provisions of this section shall not be construed to prevent a licensed physician from prescribing in good faith for the use of a

patient under his care for the treatment of a drug habit any substances he may deem necessary for such treatment: *Provided*, That the prescriptions given, the records to be made and preserved, and the labels of the containers in which the substances are dispensed shall conform in all respects to the requirements for prescriptions, records and labels provided in Section 1 of this act; *provided further*, that the physician shall immediately notify the state board of health of the beginning of the treatment of a patient for a drug habit, and the name and address of such patient, and shall repeat such notice every thirty days during the period such treatment is continued. It shall be the duty of the state board of health to retain on file for a period of two years all notices received by it under this section, which notices shall be open to inspection by the authorities charged with enforcing the provisions of this act.

*Section 3.* Where the possession, sale or other disposal of any the substances enumerated in Section 1 of this act by manufacturers, wholesale druggists, hospitals, or similar institutions, is not under the supervision of a licensed pharmacist, physician, dentist or veterinarian, a license shall be secured from the state board of pharmacy authorizing such possession, sale or other disposal.

The state board of pharmacy is authorized to license as a retail dealer for the purposes of this act the proprietor or manager of a retail merchandising establishment having a fixed location not less than one mile distant from the place of business of a registered pharmacist or from the office of a licensed physician, authorizing such licensed dealer to possess, sell and otherwise dispose of the preparations which are exempted under paragraph (c) of Section 1.

Such licenses shall be issued by the state board of pharmacy only when said board is satisfied that the possession, sale or other disposal authorized thereunder is for legitimate use only, within the intent and of this act.

The said board of pharmacy is authorized to require the prepayment of an annual fee of one dollar for each license issued to a manufacturer, wholesale druggist, hospital or similar institution, or retail dealer, in conformity with the provisions of this section.

*Section 4.* Whoever shall violate or fail to comply with any of the provisions of this act, or shall make or cause to be made any false statement in any of the prescriptions, records or reports required by this act, or shall mutilate

late, conceal or destroy any of the said prescriptions, records or reports, or whoever, for the purpose of obtaining any of the substances enumerated in Section 1 of this act, shall falsely represent himself to be a manufacturer, wholesale druggist, licensed physician, licensed pharmacist, licensed dentist, licensed veterinarian, or licensed dealer, or to be conducting a hospital or similar institution, or who shall make or issue a false or forged prescription, or alter or change a lawfully issued prescription, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not more than \$50, and upon conviction of a second or any subsequent offense shall be fined not more than \$500, or imprisoned not more than six months, or both fined and imprisoned in the discretion of the court. *Provided*. That no legally licensed pharmacist shall be held liable for the innocent compounding or dispensing of any of the articles enumerated in Section 1 of this act in consequence of a false, fraudulent, altered or forged prescription which he in good faith believed to be the original unaltered prescription of a licensed physician, dentist or veterinarian, issued for a lawful purpose.

It shall not be necessary to negative any of the exceptions or exemptions of this act in any complaint, information, indictment or other proceeding laid or brought under this act, and the burden of proof of any such exemption or exception shall be upon the person claiming the benefit thereof.

*Section 5.* Whenever any licensed physician, pharmacist, dentist, veterinarian, manufacturer, wholesale or retail dealer, or institution shall have been twice convicted in a court of competent jurisdiction of a substantial violation of this act, the officers or board having power to issue license to such licensed persons, may, after giving the convicted licensee reasonable notice and fair opportunity to be heard, order the suspension of such license for a stated period, or may order the complete annulment and revocation of such license, if in the discretion of the board, the public welfare requires such suspension or revocation.

Whenever it shall be made to appear that any licensed pharmacist, physician, dentist, veterinarian, or other person authorized to administer or otherwise dispose of the substances enumerated in Section 1 of this act, has become addicted to the personal use of any of the said drugs in a manner contrary to the public welfare, the officers or board

empowered to issue such licenses may, after due notice and a fair opportunity for a hearing to the person accused of such drug addiction, order the suspension or complete annulment and revocation of the license of such addicted person.

The provisions of this section shall not be held to prohibit an appeal to any court having jurisdiction for a review of the sufficiency of the evidence upon which the suspension or revocation of any license was made.

The word "person" as used in this act shall be construed to mean and include a firm, partnership, association, company or corporation as well as a natural person.

In case of the prosecution of an individual, a firm, partnership, association, company, or corporation for any violation of this act, the agent of such individual or the agent, officer or member of such firm, partnership, association, company or corporation, whose act or omission caused or permitted such violation may, in addition to the charge against the principal, be separately charged with such violation and on conviction shall be subject to all the penalties imposed by this act, including suspension or revocation of registration or license in the same manner as if the said act or omission had been for or on his own account.

*Section 6.* It shall be the duty of the state board of pharmacy or of the public prosecutor to enforce the provisions of this act, to investigate or cause to be investigated all reports of its violation, and to prosecute all violations of the same, and the said state board of pharmacy is hereby empowered to retain and employ such agents, inspectors, and other persons as it may deem necessary for that purpose.

All fines recovered under this act shall be paid to the order of the state board of pharmacy, and by said board shall be covered to the state treasury.

*Section 7.* That the sum of ——— dollars, or so much thereof as may be necessary, be and hereby is appropriated, out of any money in the state treasury not otherwise appropriated, for the purpose of carrying the provisions of this act into effect.

*Section 8.* All acts and parts of acts in conflict with the provisions of this act shall be, and the same are hereby repealed.

*Section 9.* This act shall be in force from and after the ———.

## Necrology

### FRANK D. OSBORN.

Frank D. Osborn, of Davenport, Iowa, was born at Davenport, Iowa, on December 16, 1884, and died after a long illness, on February 24, 1915, at the home of his parents, Mr. and Mrs. C. E. Osborn, of Davenport. He received his early education in the public schools of his native city, graduating from the high school in 1903. He then was apprenticed to S. Moetzel for two years, and later, entered the School of Pharmacy, University of Michigan, graduating with high honors in 1908. After graduation, he was employed as chemist for the Davenport Corn Products Refining Co., and then opened the first drug store in Bettendorf, Iowa, and was, also, the first postmaster of that city.

Mr. Osborn was a member of the Alumni Society of the University of Michigan, and the American Chemical Society, and became a member of the American Pharmaceutical Association in 1913.

J. W. E.

### FREDERICK A. HUBBARD.

Frederick Arthur Hubbard, of 8 Hollis Street, Newton, Mass., for twenty-seven years a pharmacist and formerly an alderman of that city, died on April 19, 1915, from heart disease, at his summer home, Duxbury, Mass. He was born in Manchester, N. H., and was 56 years of age. The funeral services were held at the Methodist Episcopal Church on April 22d.

Mr. Hubbard was a member of the American Pharmaceutical Association since 1907 and Chairman of the New England Branch, Ex-President of the Massachusetts State Pharmaceutical Association, and a member of its Legislative Committee. He was, also, a member of the Massachusetts College of Pharmacy and one of its Trustees, and President of the National Association of Boards of Pharmacy (1907-1908). He served two terms as a member of the Massachusetts State Board of Pharmacy, and was a member of the National Association of Retail Drug-gists. He was actively interested in the Dalhousie Lodge of Masons, and the Hinnnewell Club, and was the first president of the Newton Board of Trade.

Mr. Hubbard leaves a widow, a daughter, Mrs. Florence Whitcomb, of Oxford, Ohio,

and a son, George W., a student at the Massachusetts College of Pharmacy and associated with him in business.

Mr. Hubbard was highly respected as a citizen and by the members of his profession. He gave generously of his time for the benefit of his fellow pharmacists, and in both state and national legislation he was deeply interested. He was a man among men and a credit to his craft. All honor to his memory.

<>

J. W. E.

FRED. M. FISK.

Fred M. Fisk, manager of the European headquarters of Parke, Davis & Co., in London, died on the evening of Saturday, April 10. While the end came suddenly, Mr. Fisk had been seriously ill and in the hands of physicians for a number of months.

Mr. Fisk's connection with Parke, Davis & Co. covered a period of something like thirty years. He was employed to explore what was then new territory for the products of the house. First "covering" the Pacific Coast, he was subsequently sent on a trip around the world. His success in introducing the preparations of the house in countries like Japan, India and Australia ultimately led to the establishment of branches and to the final development of an enormous trade in those sections of the world.

Mr. Fisk was born in Adrian, Michigan.

He was prominent in the Masonic circles of London, and was master of the American Masonic Lodge at the time of his death. In the American Colony he was always conspicuous; he was secretary of the London branch of the American Navy League, and president of the American Society.

## Council Business

### COUNCIL LETTER No. 13.

Philadelphia, Pa., January 4, 1915.

To the members of the Council:

*Motions No. 23 (Approval of General Rules of Publication), No. 24 (Election of Local Secretary for 1915) and No. 25 (Disapproval of Proposed Exhibit at the Panama-Pacific Exposition)* have each received a majority of affirmative votes.

The following communication has been received from Frank H. Freericks:

"In voting 'No' on Motion No. 22, I feel the need for making a short explanation: The discussion which has taken place with reference to invitations was in each case an expression of an individual opinion or view, and in no manner can it be regarded as an expression of the Council. If any of those who are directly concerned have read or do read the discussion, they will realize that the entire matter was tabled (if such be the case) purely because of propriety and thoughtful consideration. It does not seem to me that the matter will be helped any by expressing sincere appreciation for unselfish work done, and I do not understand a New Year's greeting to be called for any more this year than any other year. I assume that all brother pharmacists in every one of the countries now at war have been doing their full duty, but frankly I do not know a thing about it, and I cannot well express appreciation for the doing of something which I do not know to have been done. Am sure that it will not harm anyone to send the "greetings" and to express appreciation, but somehow I am inclined to feel that some of the recipients would smile at our expense."

If any of the members of the Council wish to change their votes on Motion 22, the opportunity is open, as the vote has not been announced.

George M. Beringer writes as follows:

"Beyond any doubt the pharmacists of the countries engaged in the present unfortunate European war are suffering many hardships and their privations and tribulations may be expected to be still further increased as the war progresses.

Already there comes to us, through Hol-

land, an appeal for aid to the pharmacists of Belgium, many of whom have lost everything. A similar condition probably exists among the pharmacists of Northern France and in other countries where battles are being fought or have already been waged.

With peace will come even more urgently the need for the rehabilitation, the re-establishment of our brother pharmacists in these foreign countries. Many will need our aid to secure the opportunity to re-engage in their peaceful avocation as a means of livelihood.

I, therefore, recommend and will move that the American Pharmaceutical Association through the Council, appoint a Committee to co-operate with committees appointed for a similar purpose by other pharmaceutical, drug and chemical societies for the purpose of soliciting funds to aid the worthy and needy foreign pharmacists who have suffered by this war, irrespective of their nationalities.

By such a movement, American pharmacists, while maintaining neutrality, can, nevertheless, demonstrate that they are actuated by a true spirit of philanthropy to alleviate the suffering, to mitigate the hardships and to extend a helping hand to our brothers in distress across the seas."

The following communication has been received:

Philadelphia, Pa., January 2, 1915.

Members of the Council:

Gentlemen—It will be recalled that at the Detroit (1914) meeting of the Association the position of Editor of the Journal was not filled, but that the matter of selecting an Editor was left to the Committee on Publication with power to act, subject to the approval of the Council.

The Committee on Publication not being able to decide the question at the Detroit meeting, engaged Ernest C. Marshall as Acting Editor, from month to month, until the Editor could be chosen. Professor William B. Day consented to serve as General Secretary, and on the nomination of the Chairman of the Committee on Publication, was so elected.

The position of Editor was then offered to Professor E. G. Eberle, who promised to decide later. He has decided to accept the position and has presented his application as follows:

Dallas, Texas, December 1, 1914.

Mr. J. W. England, Chairman of Committee on Publication, Philadelphia, Pa.:

Dear Mr. England—Replying to the request of the Committee on Publication for a proposition under which I would accept the editorship of the Journal of the American Pharmaceutical Association, my present connection should perhaps be referred to.

In the first place, the consideration came, as you know, through suggestion, and appealed to me as a possibility for service to the Association which might reflect credit upon myself and to this end my best efforts would be directed.

My several positions which will terminate when I leave here bring me about \$4,000 yearly, so that financial betterment is hardly the object with me; however, I must give thought to the financial side as quite a number look to me for support.

Leaving here, I am burning the bridges, some of which have been constructed by long friendships and service in behalf of the druggists in this section. It takes only a short while to give up that which has required years to obtain. You are more or less familiar with my activities.

Leaving now reference to my own affairs and speaking of the Journal; there will be opportunities for business throughout the year, but as advertising contracts are usually made following annual meetings, the most opportune time is in December and January.

I am of the opinion that it would be best for the Association to have the office of Secretary and Editor separate, because this insures two good workers instead of one, though very likely will involve greater expense.

These thoughts have had a part in shaping my offers which I submit for your consideration, though I think some flexibility ought to be provided for. I am open to suggestions and will be glad to have every phase discussed frankly and freely, as we are all working for the best interests of the Association.

Respectfully submitted,

E. G. EBERLE.

Application of E. G. Eberle to American Pharmaceutical Association for position of Editor of the Journal of American Pharmaceutical Association, General Secretary, etc.:

To the Committee on Publication of the American Pharmaceutical Association:

(1) I will assume the editorship and general management of the Journal of the American Pharmaceutical Association, to include the position of Advertising Manager and also the duties of General Secretary of the American Pharmaceutical Association, for a salary of \$4,000 per annum, payable in monthly installments of \$333.33<sup>1</sup>/<sub>3</sub>, to begin March 1, 1915, or as soon thereafter as may be practicable.

I am to be allowed two stenographers, who are to be compensated by the Association. The office expenses are to be agreed to between the Committee on Publication or those in authority and my self to be paid by the Association.

The necessary expenses incurred in attending the annual meeting of the Association are to be paid by the Association, and also all other trips made in an official capacity and sanctioned by the Committee on Publication or those in authority. All expenses, except the salaries provided, shall first be submitted for approval to the Committee on Publication or those in authority.

Or (2) I will assume the editorship and general management of the Journal of the

American Pharmaceutical Association for a salary of \$3,500, payable in monthly installments of \$291.66<sup>2</sup>/<sub>3</sub>.

My duties shall include those of the Advertising Manager, to begin on March 1, 1915, as above indicated.

I am to be allowed one stenographer at a salary to be agreed upon between the Committee on Publication or those in authority and myself, and paid by the Association, as also the necessary office expenses.

My expenses incurred by attending the annual meetings of the Association and those made necessary for the transaction of official business shall be paid by the Association. The latter shall always be authorized by the Committee on Publication or those in authority.

Respectfully submitted,

E. G. EBERLE."

The Committee on Publication has given very careful consideration to this application. Professor Eberle is one of the most earnest workers of the American Pharmaceutical Association and one of the most able pharmaceutical journalists. It is scarcely necessary to refer to his work as President of the American Pharmaceutical Association, as Chairman of the Council and as member of the Committee on Publication. It is known to every member of the Association and known most favorably.

The Committee on Publication therefore has unanimously elected (Professor Eberle not voting) Eugene G. Eberle as Editor of the Journal under the conditions of the second proposition submitted in his application above. His engagement as Editor and Advertising Manager is to begin on March 1, 1915, or later, the exact date to be fixed by the Committee on Publication (so as to give due notice of change to the Acting Editor).

The executive work of the Association is growing very rapidly. It is probably too large a task for one man to perform the duties of both Editor and General Secretary. The work of the two offices is dissimilar, and each is of large volume. A good Editor and a good General Secretary by active co-operation can do more and better work than can one man attempting to fill both positions.

Furthermore, at a cost of only \$250 more than was paid to Dr. Beal as Editor and General Secretary, and \$1250 less than was paid to Dr. Beal as Editor and Mr. Marshall as Advertising Manager in 1914, we can have the unusual opportunity of securing two such men as Eugene G. Eberle as Editor and William B. Day as General Sec-

retary, a combination whose enthusiasm and efficiency will be of the greatest service in promoting the interests of the Association.

It will be noticed that no mention is made in the application as to the Home Office of the Journal, but Professor Eberle states that he will leave this "entirely with the Association." The Committee on Publication is of the opinion that Columbus should be retained for the Home Office at least until the annual meeting, when the subject can be considered more fully.

The Committee on Publication asks the Council to ratify its action in selecting Eugene G. Eberle as Editor of the Journal and Advertising Manager under the conditions above stated.

Very truly yours,

J. W. ENGLAND,

Chairman of Committee on Publication.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

<>

#### COUNCIL LETTER No. 15.

Philadelphia, Pa., February 8, 1915.

To the Members of the Council:

Gentlemen: After the issuance of Council Letter No. 13, the following motion was received: "Moved by C. A. Mayo, seconded by H. Englehardt, that the action of the Committee on Publication in the selection of Eugene G. Eberle as Editor and Advertising Manager of the Journal of the American Pharmaceutical Association, as reported in Council Letter No. 13, be ratified by the Council."

Later (January 23), the following letter from Geo. B. Kauffman came to hand:

"In view of conditions which have arisen and of certain statements and charges made respecting the conduct of the affairs of the Association, growing out of the action of the Publication Committee in the matter of the selection of the Editor, which said statements and charges deserve more than passing comment, I move that action by the Council concerning the action of the Publication Committee in the matter of Editorship, be deferred until the next regular meeting of the Association, and that Mr. Marshall, the present Acting Editor, be given a hearing before the Council at that time."

The motion was seconded by E. H. Thiesing.

The question then arose as to which motion should be submitted first to the Council and it was referred to Chairman Eberle, of

Dallas, Texas, who replied that, under the circumstances, he felt dis-qualified to act, and asked that the question be referred to Vice-Chairman Godding, of Boston. The latter has decided that the motion of Mr. Kauffman's should be submitted first.

Do you favor motion of Mr. Kauffman, seconded by Mr. Thiesing, as given in above letter? This will be regarded as *Motion No. 28 (Deferring Action on Editorship until next Regular Meeting of Association, etc.)*

In connection with this motion, the following letter has been received from General Secretary Day:

Members of the Council:

Gentlemen—I understand that a motion is to be presented to the Council moving that the action of the Committee on Publication in the matter of Editorship of the Journal be deferred until the San Francisco meeting of the Association on the ground, practically, that the selection of the Editor has been hasty and without proper consideration of the merits of all the candidates. As a matter of fact, may I say, on behalf of the Committee on Publication, that the subject of Editor has received most careful and serious consideration by the Committee, not only at Detroit, but since. Every candidate has received fair treatment. Injustice has been done to no one. All were weighed in the balance, and the unanimous decision of the Committee was that, in journalistic experience, in official experience in the work of the Association, and in educational experience, Eugene G. Eberle was pre-eminently the best man. It is the opinion of the Committee that the welfare of the American Pharmaceutical Association is or should be superior to the interests of any individual member. The Association is not intended to create or provide a berth for anyone.

So far as the present Acting Editor is concerned, the Committee has nothing but kindly feelings. His interests were fully considered. He was engaged at Detroit as Acting Editor, tentatively, and accepted the position under such conditions. He was not promised the position of Editor, and that he failed of election as such, is not to his discredit, but to the fact that a more experienced man was found.

So, with "malice toward no one, with charity for all," I ask the members of the Council to vote down the resolution to defer, if such be presented, and pass a motion to ratify the action of the Committee on Publication in selecting Eugene G. Eberle as Editor.

I am, yours truly,

W. M. B. DAY,  
General Secretary.

Chicago, February 4, 1915.

J. W. ENGLAND,  
Secretary of the Council.

415 N. Thirty-third Street.

## COUNCIL LETTER No. 16.

Philadelphia, Pa., February 10, 1915.

To the Members of the Council:

*Motions No. 22 (Greetings to Pharmacists and Pharmaceutical Associations of other Nations)* and *No. 27 (Election of Members: Applications Nos. 59-75 inclusive)* have each received a majority of affirmative votes.

In reference to Tentative Program for Fifty-third Annual Meeting (C. L. No. 14), M. I. Wilbert suggests that the time of holding the meeting of the Committee on Nominations (Monday) be made either one hour before the time of the President's Reception or one hour before the Second General Session, and to meet this suggestion, if there is no objection, the time will be made 8:30 p. m.

Wm. J. Lowry, Jr., Secretary of the Baltimore Branch, advises that Henry P. Hynson has been elected Council Representative of the Baltimore Branch, succeeding John B. Thomas.

F. W. Nitardy, Secretary of the Denver Branch, advises that Samuel T. Hensel has been elected Council Representative of the Denver Branch, succeeding John A. Martin.

Jerome A. Wilkerson has been elected Council Representative of the St. Louis Branch, succeeding Wm. K. Ihärdt. (Journ. A. Ph. A., Dec., 1911, 1747.)

A number of communications have been received relative to Motion No. 26 (Reply to Article in Pearson's Magazine), as follows:

M. I. Wilbert—"Motion No. 26: This is neither wise nor expedient."

L. E. Sayre—"Motion No. 26: I would say p. 49, line 6 takes the valuable time, etc."

F. G. Eberle—"Motion No. 26: While my conclusions were to let the article go unnoticed rather than give it further publicity, the answer is well-worded, and I can offer no objection."

F. C. Godbold—"Motion No. 26: In voting 'no' on reply to article in Pearson's Magazine, I believe that it is best for the pharmacist as individuals to answer to their patrons such complaints, and for the Association to keep out of print on the matter. I have been answering this charge for years to individuals, as occasion required, to the satisfaction of the individual. I remember on one occasion a customer 'phoned for 25¢ worth of Brown Mixture, the XX kind. I sent for the prescription which was Brown

Mixture Tablets, No. XX. Take as directed."

T. F. Main—"Motion No. 26: In regard to the reply to article in Pearson's Magazine, it is very nicely worded but I am afraid it is over the heads of the people who read that magazine.

I have always given a short answer to those who complained that pharmacists charged one price for an article sold in bulk and a higher price for the same thing when dispensed on prescription, by calling the attention of complainant that the pharmacist's charge did not differ in any way from the practice prevailing in the trades, for instance, if one orders a carpenter to send 12 foot of 1-inch plank, he gets a bill for it, but if he orders him to send up a 12-foot 1-inch plank cut into three foot lengths, the same to be put up in a closet as shelving, he will get a bill for so many feet of plank, so many screws, so many brackets and finally for so much time, and I have always contested that the pharmacist's charge for his professional time was in the majority of cases far lower than the time charged by the ordinary laborer in the trades."

C. T. P. Fennel—"Motion No. 26: In reference to reply to Pearson article I will say that the opening statement is subject to criticism. Dispensing of medicines and their preparation in suitable form was in the hands of the physician. Alchemy next arose as an independent science. Paracelsus was the founder of Pharmacy (that is the preparation of medicine for the purpose of curing disease) by placing Alchemy with Medicine, and eventually the science of Chemistry and Pharmacy as separate sciences were evolved.

Take as a concrete example, etc. I would not use the term Baking Soda as synonymous with Bicarbonate of Soda. Baking Soda need not conform to the U. S. P. requirements, and hence the article usually sold by pharmacists and grocers, etc., is very much inferior and cheaper to the pharmacopoeial Bicarbonate of Soda. I would include in the paragraph the fact that there is a vast difference between Alum, Borax, etc., used for technical purposes and those used for prescription work. Epsom Salt, the by-product of the manufacture of CO<sub>2</sub> gas, has no commercial value, but it is sold in immense quantities by certain class of druggists in pound packages. The article does

not conform to the U. S. P., and hence price-comparisons in prescription is not possible."

S. L. Hilton—"Motion No. 26: With reference to Motion No. 26, permit me to say that I for one do not approve of any such action by the Council; there never was or never will be any question that is handled by a newspaper man, no matter how much merit there may be in it, that can be brought to the attention of the public in which the other side will not get the worst of it; we must remember that they have everything to gain and nothing to lose, and they have every means at their command to combat every argument that may be presented, and if it has any merit or justice in it they will resort to ridicule to break it down. 'It is always the hurt dog that hollers,' and I do not want to see the American Pharmaceutical Association placed in this position to be ridiculed, consequently I must vote 'No' on Motion 26.

I might also add that I had the same proposition put up to me to answer shortly after its publication; it took me but a few minutes to decide that it was absolutely useless for the reasons that nothing would be gained as above pointed out and I could not help but losing out."

W. C. Alpers—"Motion No. 26: As to the statement prepared by the Philadelphia Branch of the American Pharmaceutical Association every pharmacist will readily subscribe to every word stated there. In my mind, however, the wording of the statement is much too mild. Stronger words expressing indignation rather than complaint should be used and the miserable villifier punished and refuted in a manner that cannot be misunderstood. Why not ask him if the sheet of paper on which he wrote his invectives and the ink that he shamefully spilled in doing so were worth the price that he was paid for his article? Why not make the suggestion that a national board of magazine writers be created and that each writer should pass an examination as to his qualifications just as the pharmacist has to do? Such an arrangement would eliminate the miserable ignoramuses that now write on pharmaceutical, chemical and medical subjects for the purpose of creating sensation with total disregard of facts and truth.

These are only a few of the suggestions that might be made in reply to the article published in Pearson's Magazine."

Frederick J. Wulling—"Motion No. 26:

Concerning the reply to Pearson's Magazine, let me say that I would not dignify the article by any reply at all. I believe the Association should entirely ignore the article, for I believe it has not injured pharmacy in the eyes of fair-minded people. If the reply is published, I would suggest the omission of the poetry because it is not sufficiently clear and apropos for the average reader. The reply would also need editing. I take it that Motion 26 intends to give the Philadelphia Branch the privilege to send this reply. In that case it should appear that the reply is by the Philadelphia Branch and not by the Association. If the reply is to be by the Philadelphia Branch, I would not mind approving the motion, but if the reply is intended to come from the A. Ph. A., then I vote 'No.'"

Professor Wulling's point that Motion No. 26 intends to give the Philadelphia Branch the privilege of sending the reply submitted to the Council and represents only the opinions of the Branch and not the Council will be (if the motion carries) adopted, unless there be objection.

*Motion No. 29 (Applications for Membership).* You are requested to vote on the following applications for membership:

No. 76. Samuel Cahan, 864 North Tenth St., Philadelphia, Pa., rec. by Harry Seidman and Frank X. Moerk.

No. 77. Louis H. Luck, 198 W. Union St., Burlington, Vermont, rec. by John G. Godding and Wm. H. Zottman.

<<

# COUNCIL LETTER No. 17.

Philadelphia, Pa., February 22, 1915.

To the Members of the Council:

*Motion No. 26 (Reply to Article in Pearson's Magazine representing opinions of Philadelphia Branch)* has received a majority of affirmative votes.

Under date of January 6, a motion was received from C. A. Mayo "that the action of the Committee on Publication in the selection of Eugene G. Eberle as Editor and Advertising Manager of the Journal of the American Pharmaceutical Association, as reported in Council Letter No. 13, be ratified by the Council."

On January 23, a motion was received from Geo. B. Kauffman, deferring action on editorship until the next regular meeting of the Association, etc. (Council Letter No. 15). This motion was submitted to the Council, being regarded as *Motion No. 28*.

The results of the vote on this motion are as follows:

Yes—Messrs. Kauffman, Thiesing, Alpers, Packard, LaPierre, White, Schafer, and Hynson—8.

No—Messrs. Godding, Gordon, Gietner, Beringer, McElhenie, Day, Rogers, Seltzer, Diehl, Whelpley, C. E. Caspari, Hensel, Godbold, Wulling, Fennel, England, Osseward, Clark, Hilton, Koch, Claus, Stewart, Wilkerson and Sayre—21.

*Not voting*—Messrs. Eberle, C. Caspari, Jr., Englehardt, Fredericks, Havenhill, Hopp, Mayo, Schneider and Wilbert—9.

*Motion No. 28* has therefore not been carried.

The following communication has been received from C. Herbert Packard:

February 8, 1915.

To the Members of the Council of the American Pharmaceutical Association:

Gentlemen—We have received statements regarding the filling of the position of Editor of the Journal, and I believe it is my duty to write in favor of Mr. Marshall, first, because he has filled the position made vacant by Doctor Beil's illness, in a most acceptable manner.

Secondly, I ought to speak of Mr. Marshall, because I probably know him better than many of the Council.

I first met Mr. Marshall in 1890 or '91, at

a time when he delivered an address to a graduating class of the Massachusetts College of Pharmacy. It was without doubt the strongest and best oration I have ever heard and as such made a lasting impression upon me.

Since that time he has always shown a loyalty to pharmacy, the ability to fill every position given him, working with untiring effort in the discharge of the same.

Our first thought should be to the person filling the position at the time of an election, if his work has been well and properly done. In reference to Mr. Marshall, I have never heard a word of inefficiency, but much of praise.

Regarding Mr. Eberle for the position, will say that there is not a gentleman in the Association better equipped or one I admire greater.

Mr. England and every member of the Committee on Publication have my greatest respect as gentlemen, men of experience and of ability. I cannot help, however, to believe that they have overlooked just as good a man for the work as can be found, "overlooked because he is at hand."

It is not necessary to go abroad when looking for a man without first comparing the ones at home with the best.

In justice to Mr. Marshall for the necessity of moving his home, the expense he has had to meet, his ability to fill the position, and, lastly, his liking for the work, I believe we should consider him first, and I therefore make a motion that Mr. Ernest C. Marshall be elected Editor of the Journal of the American Pharmaceutical Association.

Fraternally yours,

C. HERBERT PACKARD.

I second the above motion—Elie H. LaPierre.

Mr. Packard's motion is obviously offered as a substitute motion for Mr. Mayo's motion of January 6.

C. T. P. Fennel writes as follows:

Cincinnati, February 10, 1915.

Mr. J. W. England, Secretary of the Council,  
A. Ph. A.:

Dear Sir—Relative to the selection of Eugene G. Eberle as Editor and Advertising Manager of the Journal of the American Pharmaceutical Association by the Committee on Publication: I can find at this time no valid reason why ratification by the Council of the action of the Committee should be deferred to the general meeting of the Association. The action of the Committee has been deliberate in safeguarding the interests of the national body. Their viewpoint and scope of investigation is far greater than that of any single individual and should therefore receive primary consideration. The sooner ratification by Council of the Committee's action is taken, the better for the welfare of the Journal as well as the national body. Under this view, I must vote "no" on Motion No. 28. Your truly,

C. T. P. FENNEL.

George M. Beringer writes as follows:

Camden, N. J., February 12, 1915.

Members of the Council:

Gentlemen—I have received from Mr. C. Herbert Packard his letter containing the motion seconded by Mr. LaPierre.

In no way do I intend to say anything prejudicial to Mr. Marshall. The members of the Council should be fully acquainted with the situation confronting them. The Committee on Publication have not acted at all hastily nor unfairly. At the Detroit meeting, their report was accepted and they were empowered to do certain things in behalf of the Association. In the discharge of one of their specific duties, they have weighed carefully the availability of the different names that have been presented for the editorship. Their decision in favor of Prof. Eberle appears to have been unanimous and without any prejudice to any of the other candidates whose good parts have been fully considered. It is exceedingly unfortunate that Mr. Marshall should have considered the action of the Committee as a personal affront and charged the Chairman of the Committee on Publication with any unfairness to him.

Mr. Packard himself testifies in no uncertain language as to the fitness of Prof. Eberle in the statement that "there is not a gentleman in the Association better equipped or one I admire greater," and thus confirms the judgment of the Committee.

With no desire to be unfair to Mr. Marshall, the Committee must recognize its responsibility and its duty and, the duty of the Council likewise, to be entirely fair to Prof. Eberle. The latter gentlemen became a candidate for this office at the solicitation of members of the Committee on Publication who considered him to be especially fitted for this undertaking. After due consideration of the suggestion made to him at Detroit, he became a candidate and, doubtless, has severed other connections to take up this work at the time agreed upon with the Committee on Publication.

Prof. Eberle has acted in a loyal and gentlemanly way throughout this entire matter, and I feel that it is but due to him that there should be no uncertainty as to the termination of this question nor as to the loyal support of the membership of the Association to him as Editor. Without unnecessary delay, the Council should settle this question as a business proposition that has been properly placed before the body that is empowered to transact the business for the Association.

Yours very truly,

GEORGE M. BERINGER.

Frederick T. Gordon writes as follows:

February 20, 1915.

To the Members of the Council:

Gentlemen—There has been some question about the ratification by the Council of the election of Eugene G. Eberle to the office of Editor of the Journal.

Prof. Eberle was the unanimous choice of the Committee on Publication for this very

important position. A movement has been started to discredit the unanimous report of the Committee by substituting the name of E. C. Marshall for that of E. G. Eberle.

It seems to me that unless charges can be preferred or any evidence of unfitness on the part of Mr. Eberle to serve as Editor can be adduced, the members of the Council should uphold and approve the unanimous vote of the Committee in favor of Mr. Eberle, especially as the original motion on which the power of the Committee rests, reads as follows:

"That the matter of selecting an Editor be left to the Committee on Publication with power to act, subject to the approval of the Council." (Journ. A. Ph. A., 1914, 1397).

It should be noted that *the Council has no power in the matter of selecting an Editor except to ratify the action of the Committee on Publication since the Committee was made the legal agent of the Council with special power conferred upon it.*

In my judgment, the Packard motion to elect Mr. Marshall Editor is clearly out of order, parliamentarily; the nomination or recommendation should have been submitted to the Committee on Publication, and then, if approved by the Committee, acted upon by the Council, in accordance with the decision of the Detroit Convention.

The Committee on Publication would be entirely justified in standing on its rights in this matter, but it is, apparently, willing to waive them and give Mr. Marshall his "day in court," if the issue can be settled quickly by the Council. There has been already too much delay and dilatory tactics. The present condition of unsettled affairs cannot be maintained without injury to the Association, and the sooner Prof. Eberle is elected Editor of the Journal the better.

If Mr. Marshall succeeds, however, in influencing a sufficient number of the Council members to reject the vote of the Committee on Publication, then the Council will be in the position of discrediting a Committee especially ordered to nominate an Editor; and such action will discredit, not only the Council and the Association, but also, the whole work of Eugene G. Eberle, who has served the A. Ph. A. so ably as President, and as Chairman of the Council since 1912. This work has been done without pay and at much personal sacrifice. Further, as Editor of the Southern Pharmaceutical Journal he will be placed in a most embarrassing position. He would be thoroughly justified to protect his own honor by sending in his own resignation as a member of the A. Ph. A.

I earnestly trust that the Council will vote down the Packard-LaPierre motion.

Very truly yours,

FREDERICK T. GORDON.

Do you favor the motion that E. C. Marshall be elected Editor of the Journal of the American Pharmaceutical Association, as made by C. Herbert Packard, and sec-

ended by Elie H. LaPierre. This will be regarded as *Motion No. 30 (Election of E. C. Marshall as Editor of the Journal)*.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

#### COUNCIL LETTER No. 18.

Philadelphia, Pa., March 4, 1915.

To the Members of the Council:

*Motion No. 30 (Election of E. C. Marshall as Editor of the Journal)*, a substitute motion for the Mayo-Engelhardt motion of January 6, has not been carried.

The results of the vote on this motion are as follows:

Yes—Messrs. Packard, LaPierre and White—3.

No—Messrs. Beringer, C. E. Carpari, Claus, Day, Diehl, Engelhardt, England, Fennel, Gietner, Godbold, Godding, Gordon, Hensel, Hilton, Hopp, McElhenie, Osseward, Rogers, Sayre, Seltzer, Stewart, Whelpley, Wilkerson and Wulling—24

*Not voting*—Messrs. Eberle, Alpers, C. Caspari, Jr., Clark, Freericks, Havenhill, Hynson, Kauffman, Koch, Mayo, Schafer, Schneider, Thiesing and Wilbert—14.

The vote will now be taken on the motion of C. A. Mayo, seconded by H. Engelhardt, of January 6, which is as follows:

*Motion No. 31 (Election of E. G. Eberle as Editor of the Journal)*. Moved by C. A. Mayo, seconded by H. Engelhardt, that the action of the Committee on Publication in the selection of Eugene G. Eberle as Editor and Advertising Manager of the Journal of the American Pharmaceutical Association, as reported in Council Letter No. 13, be ratified by the Council.

The following communication has been received:

Dallas, Texas, February 26, 1915.

To the Members of the Council, A. Ph. A.:

It was my intention to maintain silence in the matter of electing an Editor of the Journal, and while I now deem it necessary to write, I will be very brief.

I desire every member to act, without prejudice or personal favoritism, that is, only in the interest of our Association. I have not nor will I be offended by any action any member may take, my desire is intense that the best interests of the Association should be kept in mind—to this end only, I plead with you.

I have never sought office in the Association nor asked any one to vote for me, unless yielding to the request, my application for the position of Editor be so considered.

I have never made a sacrifice for the Association that I regret, and this applies to the present situation, nor will I take exception to any action the Association may take regarding myself.

I hope no one will be influenced by personal favor or prejudice. If these few lines have had such effect, forget them, let us all work for whatever promotes harmony and tends to enhance the value of our own association, for its members and pharmacy in general. So far as I am concerned, change of mind, amendments and substitute motions give no offense, and your action will not offend me.

It would be a source of keenest regret to have any one say justly that I had directly or indirectly been hurtful to the Association or that by word I might have prevented dissension and injury. Sincerely yours,

E. G. EBERLE.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

#### COUNCIL LETTER No. 19.

Philadelphia, Pa., March 16, 1915.

To the Members of the Council:

*Motion No. 29 (Election of Members; Applications Nos. 76 to 87 inclusive)* has received a majority of affirmative votes.

In re Motion No. 30, Frank H. Freericks writes:

"Please find herewith my vote on Motion No. 30, which I would ask to briefly explain: In voting "No" I do not in any manner mean to reflect upon the ability of the Acting Editor, and I would even say, that in so far as I have been able to judge the work of the Acting Editor as evidenced by the Journal issued under his direction, has been good. However, it has been my understanding right along that the Publication Committee was charged with the duty of selecting the most suitable man for the permanent Editorship, and believing the Publication Committee as a whole to be best fitted to decide upon the most suitable man, I would regard it to be distinctly wrong on my part to vote contrary to their decision and recommendation."

C. Herbert Packard writes:

"March 6, 1915.

Mr. Joseph W. England, Secretary of the Council, American Pharmaceutical Association:

Dear Mr. England—I have received Council Letter No. 18 and note that my motion has lost by a great majority.

My loyalty to Mr. Marshall was due not only to a strong friendship but a belief in his ability. We of the East, Mr. Marshall's home, know him better than members of other sections and, in working for him, believed his election would not only be advantageous to him but to the Association as well. We have witnessed his work and have known of his capabilities for years.

It is now my desire, having lost after a

fair statement, to have Motion No. 31 carried unanimously for the election of Professor Eberle.

I believe I can say for Professor LaPierre, as well as for myself, that it is our earnest wish that perfect harmony and good feeling shall exist and all members of the Council work with one thought,—the best interests of the American Pharmaceutical Association.

With highest regards to you and all our members, I am, Yours very truly,

C. HERBERT PACKARD."

*Motion No. 31 (Election of E. G. Eberle as Editor of the Journal, etc.)* has been carried.

The results of the vote on this motion are as follows:

*Yes*—Messrs. Alpers, Beringer, C. E. Caspari, Clark, Claus, Day, Diehl, Engelhardt, England, Fennel, Freericks, Gietner, Godbold, Godding, Gordon, Havenhill, Hensel, Hilton, Hopp, Koch, LaPierre, McElhenie, Osseward, Packard, Rogers, Sayre, Schafer, Seltzer, Stewart, Whelpley, White, Wilbert, Wilkerson and Wulling—34.

*No*—Mr. Hynson—1.

*Not Voting*—Messrs. Eberle, Mayo, C. Caspari, Jr., Kauffman, Thiesing and Schneider—6.

Relative to Motion No. 31, H. P. Hynson writes as follows:

"In voting 'No' on Motion 31, I would like it to be placed on record that I do so, because I think the adoption of this motion would be unsound from a business standpoint and would entail imprudent obligations upon the Association, by accepting personal sacrifices from Mr. Eberle, which are not justified and which, in all probability, will be, finally, embarrassing to the Association.

I neither vote for or against Mr. Eberle, personally, nor for or against his abilities. I am, however, fully convinced that a much younger man should be selected as editor of the Journal, one who may develop with the publication and continue useful to the Association for a greater number of years than can possibly be Mr. Eberle's good fortune."

John G. Godding writes as follows:

"General Secretary Day referred to the Chairman of the Centennial Fund the application of Prof. Edw. Kremers for \$100 from the fund, the amount to be used in connection with his work on the cultivation of medicinal plants and such related subjects as the curing of cultivated and wild plants.

The application has been approved by the

Committee on Centennial Fund with the understanding, if granted by the Council, it is to be handled as other appropriations made by the Council."

The above application for appropriation has been approved by the Committee on Finance.

*Motion No. 32 (Appropriation of \$100 from Centennial Fund for Research Work on Medicinal Plants, etc.)* Moved by W. B. Day, seconded by J. G. Godding, that \$100 be appropriated from the Centennial Fund to Prof. Edw. Kremers for research work on medicinal plants and cultivated and wild plants.

*Motion No. 33 (Applications for Membership)*. You are requested to vote on the following applications for membership:

No. 88. Irvin Simpson Zeluff, 75 Barrow St., New York, N. Y., rec. by Romaine Pierson and Frank L. McCartney.

No. 89. William S. Smetana, 916 Excelsior Ave., Hopkins, Minn., rec. by John F. Dauck and Edw. L. Newcomb.

No. 90. Charles Edgar McConkey, Etoawah, Tennessee, rec. by J. O. Burge and Wm. B. Day.

No. 91. James David Fields, Lewis Hall, University of Washington, Seattle, Wash., rec. by C. W. Johnson and Edith Hindman.

No. 92. Forrest Omo Snyder, 423 W. 60th St., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.

No. 93. Frank E. Bogart, 15 Larned St., E., Detroit, Mich., rec. by Wm. A. Hall and N. H. Jones.

No. 94. Emile Frederick Krapf, 1068 Steuben St., Pittsburgh, Pa., rec. by J. A. Koch and John H. Wurdach.

No. 95. Carl Julius Goltz, P. O. Box 1273, Havana, Cuba, rec. by Jose P. Alacan and Jose Guillermo Diaz.

No. 96. Cornelius Wm. Dore, 119 Martin Ave., San Jose, Cal., rec. by J. G. Munson and N. A. Pellerame.

No. 97. John Harper Long, 2421 Dearborn St., Chicago, Ill., rec. by C. W. Patterson and M. A. Miner.

No. 98. Omar Harwell Whittington, Van Buren, Arkansas, rec. by J. H. Beal and W. B. Day.

No. 99. Milton P. Givens, Jr., 425 Franklin St., Denver, Col., rec. by W. A. Hover and F. W. Nitardy.

No. 100. Ray David Dame, Stratton, Nebraska, rec. by H. C. Newton and I. Curtis Arledge (nomination for membership and 1915 dues awarded by Professor H. C. Newton in recognition of excellent work at Creighton College of Pharmacy).

No. 101. John Philip Schaupner, 399 Linwood Ave., Detroit, Mich., rec. by N. H. Jones and A. A. Wheeler.

J. W. ENGLAND,  
Secretary of the Council.

415 N. Thirty-third Street.

## Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or type-written.

Changes of address since March 18, 1915.

PEARSON, J. T.,

From 272 King and George Sts., Annapolis, Md.

To 272 King George St., Annapolis, Md.

VITOUS, W. J.,

From 1627 Railway Ave., N. W., Puyallup, Wash.

To Doty, Wash.

WICH, H. E.,

From 1230 W. Stricker St., Baltimore, Md.

To 1230 N. Stricker St., Baltimore, Md.

BARNES, A. H.,

From 14 Newberry St., Boston, Mass.

To residence unknown.

BLACK, P. N.,

From 5165 Penn Ave., Pittsburg, Pa.

To residence unknown.

DAVENPORT, J. S.,

From care Chief Sgt., Ft. Bayard, N. Mex.

To residence unknown.

FUSON, H. L.,

From Dover, Tenn.

To residence unknown.

KÄMMERER, W. F.,

From 410 S. 6th St., Columbus, Ohio.

To residence unknown.

MAYNARD, H.,

From 2nd Division U. S. A., Texas City, Texas.

To residence unknown.

REILLY, R. C.,

From Box 1609 Los Angeles, Cal.

To 4201 S. Vermont, Los Angeles, Cal.

SARVINET, C. D.,

From 672 Benton Blvd., Los Angeles, Cal.

To Ninth and Vermont, Los Angeles, Cal.

BROWN, A. E.,

From Attending Surgeon's Office, Hdqs. Phil. Dept., 17 Nebraska, Manila, P. I. (Estado Mayor.)

To Sgt. 1st Cl. Hosp. Corps. Recruit Depot, Ft. McDowell, Cal.

BECK, JOSEPH W.,

From Winfield, Texas.

To Mt. Vernon, Texas.

FISCHNER, J. F.,

From 6859 Wentworth Ave., Chicago, Ill.

To 6901 Wentworth Ave., Chicago, Ill.

DEJONGE, CORNELIUS,

From 23 Vine St., Brooklyn, N. Y.

To 584 E. 7th St., Brooklyn, N. Y.

LAMAR, WM. R.,

From 364 N. 7th St., Newark, N. J.

To 327 N. 18th St., East Orange, N. J.

MEAD, HAROLD B.,

From 4822 N. Warnock St., Philadelphia, Pa.

To 110 Greenwood Ave., Wyncote, Pa.

SUNITTER, ADOLF,

From 1239 Boston Road, N. Y.

To 1230 Boston Road, Bronx, N. Y., N. Y.

COLSON, H. W.,

From 5755 Sangamon St., Chicago, Ill.

To 74 E. 12th St., Chicago, Ill.

MELLOR, ALFRED,

From 2130 Mt. Vernon Ave., Philadelphia, Pa.

To 152 W. Walnut Lane, Germantown, Philadelphia, Pa.

SNYDER, A. C.,

From 131½ St. Felix St., Brooklyn, N. Y.

To 282 St. James Place, Brooklyn, N. Y.

DECEASED SINCE MARCH 18, 1915.

HANNAN, O. B., Canton, Ohio.

OSBORN, FRANK D., Davenport, Iowa.

## STATEMENT OF OWNERSHIP, MANAGEMENT, ETC.,

Of the Journal of the American Pharmaceutical Association, published at Columbus, O.  
Editor—E. G. Eberle, Columbus, Ohio.

Managing Editor—E. G. Eberle, Columbus, Ohio.

Business Manager—E. G. Eberle, Columbus, Ohio.

Publisher—American Pharmaceutical Association, Office at Columbus, Ohio.

Owners—The American Pharmaceutical Association, Office, Columbus, Ohio.

Is a corporation not for profit, incorporated under U. S. Laws at Washington, D. C., and does not have a capital stock.

Known bondholders, mortgagees, and other security holders, holding 1 per cent or more of total amount of bonds, mortgages, or other securities, none.

(Signed) E. G. EBERLE, Editor

Sworn to and subscribed before me this 6th day of April, 1915.

(Signed) CICH J. RANDALL,  
Notary Public in and for Franklin County.  
My commission expires April 15, 1915.

SAMUEL A. D. SHEPPARD

TREASURER AMERICAN PHARMACEUTICAL ASSOCIATION

1886—1908

SAMUEL A. D. SHEPPARD  
Elected Honorary President of  
The American Pharmaceutical Association  
in 1908

## Samuel A. D. Sheppard

(Doctor of Pharmacy.)

In conferring the honorary degree of Doctor of Pharmacy on Mr. S. A. D. Sheppard, the Massachusetts College of Pharmacy has paid a deserved tribute to one of the most highly esteemed American pharmacists. The honor was bestowed in recognition of his distinguished services to pharmacy; the ceremony occurred as a part of the commencement exercises held May 20, 1915.

This is only the second time in the history of the Massachusetts College of Pharmacy that an honorary degree has been conferred, hence expresses the high regard of that institution for Mr. Sheppard. Many pharmacists of this country will be pleased that such acknowledgment has been made, and none more than members of the American Pharmaceutical Association.

Mr. Sheppard was an active worker for the advancement of pharmacy for more than two score of years before his health failed. He has held many positions of responsibility and honor in national and state pharmaceutical associations, never sparing himself, nor his time, nor his means, when need arose. He joined the American Pharmaceutical Association in 1865; in 1875 he served as local secretary for the Boston meeting of that year; in 1876 he was elected First Vice-President; he was a member of the first council of the Association in 1880 and chairman of the finance committee. In 1886 he was elected Treasurer of the Association and filled this office for twenty-two consecutive years; and in 1908 he was elected Honorary President.

Many other pharmaceutical associations have shared the benefits of his work. He was a charter member of the Boston Druggists' Association, the first President of the Massachusetts State Pharmaceutical Association, a member of the first State Board of Pharmacy of Massachusetts, a trustee, treasurer and president of the Massachusetts College of Pharmacy, and, a few years ago, he presented his large and valuable collection of pharmacopœias and dispensaries of all nations to that college.

## Contributed and Selected

### SYNTHESIS OF GLUCOSIDES.\*

H. ENGELHARDT, PH. D.

Glucosides occur very abundantly in the vegetable kingdom. They have the properties of being hydrolyzed by the action of dilute acids, dilute alkalies, enzymes and at times even by heating with water. They are converted into dextrose and other sugars and into substances of more or less complex constitution.

The glucosides are generally present in the assimilation organs of the plants, i. e., the leaves; very rarely are they found in the reserve organs, the rhizomes or the seeds. Most of the glucosides contain only carbon, hydrogen and oxygen; only a few, such as amygdalin, solanin, etc., contain nitrogen or, like myronic acid and sinalbin, sulphur. Chemically the glucosides must be considered as ester-like compounds of sugars, mostly dextrose. The sugars, however, are not pre-existent in the glucosides but are formed from them by hydrolysis, that is by taking up the elements of water. The amount of water taken up varies considerably. Thus: Salicin takes up one molecule, populin takes up two molecules, hesperidin takes up three molecules, helleborin takes up four molecules, jalapin takes five molecules, sinigrin takes up seven molecules, etc.

For isolating the glucosides no general process can be given on account of the ease with which they are hydrolyzed. Strong mineral acids and strong basic compounds should be avoided in the manufacturing process as well as prolonged boiling. If the drugs containing the glucosides also contain a hydrolyzing ferment the latter should first be eliminated. This can be done by treating the dried powdered drug with boiling alcohol which contains a small amount of calcium carbonate in order to neutralize any free vegetable acid, and continuing the heating for about one hour. After cooling the liquid is filtered, the alcohol is evaporated at moderate heat or preferably in a vacuum, and from the thick alcoholic residue the glucoside is extracted by boiling with neutral acetic ether; or the alcoholic extract is dissolved in water in the presence of small amounts of calcium carbonate, the solution is filtered and the filtrate evaporated under diminished pressure. The residue is then extracted with alcohol, acetic ether, acetone or other suitable solvents and the resulting solutions allowed to crystallize. At times it is necessary to defecate the alcoholic extract by carefully adding lead acetate solution. The precipitate, thus produced, is then removed by

\* Read before Baltimore Branch, A. Ph. A., April Meeting

filtration, the filtrate is deprived of the lead by hydrogen sulphide gas and the glucoside is allowed to crystallize at moderate heat.

The substances which are produced when hydrolizing glucosides are chiefly hydroxyl compounds (phenols, alcohols, aldehydes, acids) both of the aliphatic and of the aromatic series. About the constitution of these products very little is known at the present time and therefore only few of the glucosides occurring in nature could be synthesized. It was possible, however, to combine alcohols, mercaptols, phenols, etc., directly with dextrose.

Since glucosides contrary to dextrose do not act directly with phenylhydrazine with the formation of osazones, do not reduce Fehling's solution or ammoniacal silver solution, they cannot contain the aldehyde group peculiar to dextrose. They, therefore, can be compared with cane sugar and with the simplest synthetic glucosides—methyl- and ethyl-glucoside.

The glucosides are solid, non-volatile, generally crystallizable compounds which are soluble in water and alcohol with neutral reaction. The enzymes act in a very peculiar way on the glucosides. For instance, emulsin hydrolyzes amygdalin, salicin, esculin, coniferin, etc., but not sinigrin. The enzymes from yeast hydrolyze amygdalin with the formation of amygdonitril glucoside and one molecule of dextrose. Emulsin, however, hydrolyzes amygdalin completely with the formation of two molecules of dextrose and one molecule of benzaldehyde-hydrocyanic acid. The full activity of emulsin obtained from almonds can only be properly explained by assuming the presence of a number of enzymes, none of which, however, so far has been isolated from it. One of these, beta-glucosidase hydrolyzes certain glucosides, another lactase, acts on lactose, a third one, beta-galactosidase, acts on certain galactosides, a fourth one, gentiobiase, acts on gentiobiose, etc.

Notwithstanding our extensive knowledge concerning the hydrolysis of the various glucosides and of the action of the various enzymes up to the present time, as already mentioned, only very few of the glucosides found in nature have been prepared synthetically.

The first attempts to synthesize glucosides were made by Schuetzenberger (Ann. d. Chem. u. Pharm. CLX, 95) who tried to obtain salicin by the action of triacetyl-dextrose and saligenin sodium. He obtained, however, a substance which was not identical with salicin but which on hydrolyzing with diluted sulphuric acid yielded glucose and saliretin. Later on Michael (Ber. Deutsch. Chem. Ges., 1881, 2097) succeeded in obtaining compounds of dextrose with phenols which behaved exactly like the natural glucosides. The formation of these substances depended on the interaction of acetochlorohydrose or acetobromohydrose and the alkali salts of phenols. For instance, starting from these substances and salicylaldehyde potassium he obtained helicin and acetic ether. Helicin, which can be obtained from salicin by careful oxidation, therefore was the first natural glucoside produced synthetically. From this comparatively simple glucoside Fisher and Kees (Ber. Deutsch. Chem. Ges., 1885, 1953 and 3481) succeeded in obtaining synthetically the more complex orthocumaraldehyde glucoside. Schiff (Ann. CCXXIV, 19) then tried to produce glucosides by allowing aldehydes and ketones to act on sugar in acetic acid solution. The substances thus obtained were very hygroscopic and were hydrolyzed already by

water. Emil Fisher (Ber. Deutsch. Chem. Ges., 1893, 2928) finally succeeded in synthesizing glucosides by conducting hydrochloric acid gas into a solution of dextrose in methyl alcohol. The mixture soon lost its property to reduce Fehling's solution and a crystalline product of the composition  $C_6H_{11}O_6 \cdot CH_3$  which behaved like a natural glucoside and which has been named methyl glucoside was obtained. This process was later on improved by Fisher (Ber. Deutsch. Chem. Ges., 1895, 1145) by using instead of strong hydrochloric acid only very diluted acid and accelerating the reaction with the aid of heat. The dextrose was dissolved in five times its quantity of methyl alcohol which contained only .25 percent of hydrochloric acid and was heated for 50 hours at 100° or until the liquid no longer reduced Fehling's solution. By this process he was able to methylize fructose and sorbose and also to condense these sugars with ketones which could not be done when strong hydrochloric acid was employed. In a similar manner he succeeded in condensing sugars with mercaptanes, etc.

In 1898 A. C. Hill (Proc. Chem. Soc., 1898, 156), noticed that when bottom fermentation yeast prepared and purified by a special process was allowed to act on maltose, the hydrolysis could be carried out only to a certain point, and further that under certain conditions a reconstruction of the maltose apparently took place. This observation was also noticed by several other investigators but it was not until about three or four years ago that Bourquelot and his associates and pupils could prove that enzymes which hydrolyze glucosides can reconstruct them from the products of hydrolysis under certain conditions and further that by the action of enzymes glucosides can be formed, in other words, that enzymes exhibit both a hydrolyzing and synthesizing action. Further that the same enzyme can both hydrolyze and synthesize and that the action is not due to two ferments existing side by side in the same enzymes.

Bourquelot found that while preparing tinctures from certain vegetable drugs with strong alcohol changes take place during the manufacturing process, which could be due only to the action of enzymes, which apparently are not killed by strong alcohols as is generally accepted. Together with Bridel (Journal. Pharm. Chim., 1911, 11, 385) he found that emulsin acts hydrolyzing on gentiopierine in the presence of strong alcohol although the enzyme is not soluble in alcohols of a strength higher than 60 percent. The same holds good for invertase, which is also very resistant against alcohol.

While some enzymes resist the destructive action of ethyl alcohol quite well, they are comparatively easily destroyed by other alcohols. Thus for instance, by dilute methyl alcohol containing 34 to 36 percent by weight of the alcohol, normal propyl alcohol containing 20 to 22 gms. of the alcohol, butyl alcohol containing 6 to 8 percent by weight of alcohol. Bourquelot and Bridel (Journ. Pharm. Chim., 1912) later on found that emulsin not only hydrolyzes but synthesizes and that other enzymes have similar properties. Bourquelot and Bridel (Journ. Pharm. Chim., 1912, 569) then attempted to synthesize salicin from solutions of saligenin and dextrose in 85 percent alcohol in the presence of emulsin, but only betamethyl glucoside was obtained. (Previously they had found that in aqueous solution the hydrolysis of salicin with emulsin ceases when 54.7 percent of salicin had been hydrolyzed.)

Bourquelot soon succeeded in synthesizing quite a number of glucosides, starting from methyl alcohol, ethyl alcohol, butyl alcohol, isobutyl alcohol, geranyl alcohol, etc., and also from some alcohols of the aromatic series, benzyl alcohol, phenylethyl alcohol, cinnamyl alcohol, naphthyl alcohol, etc. (Bourquelot and Bridel, *Compt. rend.* CLVI, 827). Almost all the glucosides, thus prepared, crystallized quite readily. The beta-geranyl glucoside which Bourquelot and Bridel obtained (*Jour. Pharm. Chimie.*, 1913, 209) was found to be identical in every respect with the glucoside present in *pelargonium odoratissimum*.

Glucosides of solid water-insoluble alcohols may be prepared by using acetone as a solvent and varying quantities of water. Bourquelot further found that primary alcohols are converted into glucosides more readily than secondary, and the latter more readily than tertiary alcohols. All substances containing alcoholic hydroxyl groups form glucosides with dextrose in the presence of emulsin. The compounds obtained are beta-glucosides, and like natural glucosides are levorotatory and hydrolyzable by emulsin. It would be beyond the scope of this paper to relate in detail the excellent work carried out by Bourquelot and therefore only a few more synthesized glucosides may be mentioned.  $\alpha$  alcohol-glucosides are prepared by allowing the enzyme  $\alpha$  glucosidase present in bottom-fermentation yeast to act on dextrose in alcoholic solutions. The alcoholic strength of the liquid should be weaker than that used for synthesizing  $\beta$  glucosides with emulsin. These  $\alpha$  glucosides are dextrorotatory and are not hydrolyzed with emulsin.

When emulsin is allowed to act on galactose in alcoholic solution  $\beta$  ethyl galactoside is formed by the  $\beta$  glucosidase present in emulsin. (Bourquelot and Mougne, *Journ. Pharm. Chim.*, 1914, 157.) Analogous glucosides were obtained when using methyl, benzyl, etc., alcohols.

That some enzymes act synthetically in aqueous solution was shown by allowing emulsin of almonds to act upon a concentrated solution of dextrose at ordinary temperature in the presence of thymol, phenol, etc. (Bourquelot, Herissey and Coirre, *Compt. Rend.* CLVI, 752.) After allowing to stand for some time the solution was heated to destroy the enzymes, diluted and the undecomposed dextrose was destroyed by fermentation with top fermentation yeast. From the solution thus obtained gentiabiose in pure state could be isolated.

The synthesizing of glucosides is a rather tedious and time-consuming process. For instance, in order to prepare  $\beta$  methyl glucoside, 12 gms. of emulsin are added to a solution of 600 gms. of dextrose in 1020 gms. of methyl alcohol and 440 gms. of water; after allowing the mixture to stand for one month at ordinary temperature about 350 gms. of crude glucoside was obtained which when purified yielded 250 gms. of pure product.

A few words may be said in regard to the reversibility of enzyme action. If a methyl alcoholic solution containing dextrose and  $\beta$  methyl glucoside is treated with emulsin, a state of equilibrium of the synthesizing and hydrolyzing action of the enzyme is obtained. (Bourquelot and Bridel, *Compt. rend.* CLVI, 957.) When this equilibrium has been attained, further synthesis can be induced by the addition of sugar and on the other hand further hydrolysis may be promoted by the removal of sugar (Bourquelot and Bridel, *Compt. rend.* CLVIII, 206).

On the strength of numerous experiments Bourquelot arrives at the following conclusions:

1. The rapidity of synthesis increases with the quantity of enzyme present.
2. The action of the enzyme is accelerated by raising the temperature provided, however, the temperature at which the enzyme is destroyed is not exceeded.
3. For equal concentrations of dextrose the proportion converted into glucoside increases with the alcoholic strength and when the latter is kept constant is increased by raising the concentrations of the dextrose up to a limit of 15 to 20 percent.

While the above experiments so far are of little practical value, inasmuch as only a few of the natural glucosides have been prepared up to the present time, they throw considerable light on the chemical changes going on in plant life. The better known enzymes will therefore become a valuable guide in the study of chemistry in the living organism. As long as we only knew that enzymes have a hydrolyzing action on glucosides, they could only be used for detecting glucosides and polysaccharites in plants. Now, since we know, that they have a synthesizing action also, the results obtained by hydrolysis can be verified by those obtained by synthesis. Dextrose is present in all plants. When therefore a plant contains a ferment it points to the presence of the corresponding glucoside. This has been verified in the *ericaceæ*, the *gentians* and quite recently in various *orchidaceæ*. Also in many species of the *scrophulariaceæ*, especially of the genus *linaria*, in *leguminosæ*, *proteaceæ*, etc. On account of their specific action the enzymes will gradually become the most delicate and certain reagents for the study of the constitution of certain organic compounds. In plant physiology biochemical synthesis is an important factor in the production of food materials. Certain organic compounds which are insoluble in water, form with dextrose soluble compounds. Since dextrose is present in all living organisms it seems to be the best liquifying agent under certain conditions and seems to prevent the formation of certain concretions and to dispose of compounds dangerous to the organism of the plant.

On the other hand the reversibility insures the maintenance of the equilibria necessary for life. In organisms where life is active the liquid media are particularly favorable to hydrolysis, i. e., to the utilization of food materials. In reserve organs, for instance the seeds, the medium becoming gradually less aqueous, is more favorable to synthetic processes. (Bourquelot, *Journ. Pharm. Chim.*, 1914, 361 and 393.)

Whenever the chemical constitution of the products of hydrolysis of natural glucosides shall have been established we shall, without doubt, be in a position to produce such glucosides synthetically.

## HYDROGENATED OILS.\*

ANDREW CAMPBELL.

Broadly speaking, the chemical combinations presented in fixed oils and fats are glycerides of various fatty acids. The formulæ of these characteristic acids, again broadly speaking, differ from one another principally in the number of the contained hydrogen atoms, while the physical properties of the various oils seem to be dependent upon the underlying character and proportions of these acids.

Oleic and stearic acids are the most commonly presented of these substances and the physical difference caused by these two constituents is largely manifested in that oleic acid combinations give oils and fats of soft or liquid consistency while stearic acid, as a rule, is characteristic of the harder fats.

The chemical formula recognized for oleic acid is  $C_{18}H_{34}O_2$ , while that for stearic acid is  $C_{18}H_{36}O_2$ . Two hydrogen atoms, then, added to oleic acid will transform it into stearic acid. It has long been apparent that such a transformation, if it could be economically accomplished, would be of great commercial importance. The purely chemical possibility of this step was long ago demonstrated, but it has only been within recent years that practical processes, workable under commercial conditions have been devised for carrying out this chemical transformation of oleic into stearic acid or of olein and its related substances into stearin and similar bodies. It might be remarked in passing that this exact problem is very neatly solved in the economy of nature when the steer, fattened, say, on cottonseed meal, gives us tallow and oleo-stearin, but owing to the wastefulness of this process, the modern oil-chemist by his direct methods may well claim to outdo the steer.

The essential feature of all the modern hardening processes is to bring about intimate contact between the oil under treatment and gaseous hydrogen in the presence of a third substance known as a catalyzer. Numerous catalyzers have been proposed, but finely divided metallic nickel is probably the most typical. A great variety is also shown in the forms of apparatus devised for the accomplishment of the process, many of which have been the subjects of patents.

The two greatest apparent fields of usefulness for such a process seem to be the production of edible fats and the bringing into range of soap-making materials vegetable and animal oils which have hitherto been unavailable on account of the relative softness of their products or for certain other technical reasons. Hardened oils will probably find other wide uses in the arts, for example in the manufacture of lubricants, but for the present the production of edible fats and of soap-making materials is of paramount importance in the development of the process.

Two seemingly contradictory statements may be made in regard to hydrogenated oils. One is that their production is quite simple and can be carried out without elaborate or expensive apparatus and the other is that commercial success can be

---

\* Read before the Pittsburgh Branch, A. Ph. A.

attained only in rather expensive and well-equipped plants. The necessary supply and handling of hydrogen at a reasonable cost are the controlling factors of such a situation.

In the simplest form of apparatus provision only need be made for carrying a stream of hydrogen through the oil in the presence of the catalyzer at a slightly elevated temperature. On the other hand, some of the most complex and elaborate forms of apparatus have been designed and patented in great variety with a view to making the process commercially efficient.

As to catalyzers, metallic nickel seems to be most favored, but palladium is well regarded and platinum, iron and copper have been used. Oxides of these same metals have also been exploited as suitable catalyzers and one of the inventors in the line has patented the use of various organic salts of similar metallic elements. A great variety of schemes have been tried for making the catalyst not by itself but deposited in a fine state of division on the surface of some inert carrying substance. Pumice stone, kieselguhr, charcoal and sawdust have all been used. The production of a good catalyzer requires considerable care and technical skill. In the case of nickel the steps are precipitation of a nickel nitrate solution by means of alkali and the subsequent reduction of the precipitated hydroxide by heating in a current of hydrogen. Particular care is needed in controlling the temperature of the reduction process. Protection from air and moisture is required after reduction and the catalyzers are subject to the peculiar fact that the presence of even very small amounts of chlorine and sulphides greatly depreciates their activity. This is spoken of as "poisoning" the catalyzer.

Inasmuch as the hardening process is only an application of previously known chemical reactions, no basic patents can be sustained on it. Consequently we find that the many patents issued in connection with the matter fall naturally into two classes, those on particular catalyzers and the methods for producing the same and those on apparatus and devices for carrying out the general process. The catalyzer patents are of the most importance and one firm of English soap-makers, Crossfield & Sons, seems to have made some attempt at monopoly, having acquired the patents on nickel, palladium and platinum. Such an attempt, however, would not seem to be effective since numerous other patents have been issued for the oxides and the Wimmer patents cover the use of organic salts. The oxide patents are mostly held by the combination known in the trade as the Bedford-Erdman-Williams interests. Then, too, one process has been devised which dispenses entirely with catalyzers and carries out the hydrogenation by the application of hydrogen alone but at comparatively high pressures.

A great variety of fatty oils may be treated with a view to increasing their economic usefulness. The most important, on account of the utility of their hardened products, are the liquid vegetable oils such as cottonseed, corn, sesame, castor and linseed oils and the marine animal oils such as menhaden, fish and whale oils. Cottonseed oil has been the principal product under exploitation, although much work has been done abroad on fish and whale oils. Hardened cottonseed oil yields products of use in the manufacture of lard compounds and butter substitutes and the hardened train oils are equal or superior to the higher-priced tallow for soap makers.

The question of the safety and healthfulness of the edible products yielded by this method has been carefully investigated and no criticism can stand against them if care is used to eliminate the possible traces of metallic contamination originating from the catalyzing elements. Taste, odor and color of many of the oils are very much improved. Particularly is this true of the disagreeable odor of the marine oils which thorough treatment by hydrogenation seems absolutely to remove. As to this point it is interesting to note that the Japanese chemist, Tsujimoto, has demonstrated that the odor and taste of fish oil instead of being due to impurities, as had been supposed, are really caused by the presence of a characteristic fatty acid, clauponodonic acid, having the formula  $C_{18}H_{28}O_2$ , which by the addition of eight hydrogen atoms becomes stearic acid and loses its odor and taste.

Much has been reported and written about the possible wonderful cheapening of soap makers' materials, but this has been considerably exaggerated, at least for the immediate future. In Germany a perfectly odorless, white, hardened train oil has been offered on the market at 66 marks per 100 kilos, which compares with a price in the same market of 72 marks per 100 kilos for prime boiling tallow. As the process becomes better developed and more widely used very material reductions in the price of the products may be reasonably expected. As has already been indicated, no monopoly of the process is likely to be established, but on the other hand it will not be available for small fat and soap industries, on their own premises, largely on account of the expense necessary to secure the requisite supply of hydrogen at an economical price.

Factories have been established for working the process in Germany and England, while recently a Norwegian-German company has built a factory at Friedrichstad, utilizing the water-power of Hafslund Falls for the electricity needed in the works and for the production of hydrogen by the electrolytic method. This factory is expected to utilize about 300 barrels of oil daily. So far as I am aware, but one commercial project on any considerable scale has been attempted in this line in the United States. This is located at Ivorydale, Ohio, and operates under the name of the American Oil Treating and Hardening Company. A close connection with one of the large soap manufacturing concerns would seem to be indicated, but both edible and inedible hardened fats are advertised and offered by this company.

It is one of the striking facts of modern industry that so large and important developments should proceed from the utilization of such a simple and apparent chemical reaction. One is lead to a remark, which while trite is exceedingly apropos, that only the merest surface of the broad field of chemical invention has thus far been touched, and in spite of all the accomplishments of the past fifty or one hundred years, the future holds most wonderful prospects for development and achievement in chemistry. It is equally true that it is not always the abstruse and complex in chemistry that holds out the greatest possibilities, but frequently some very simple reaction carries the secret of a new industry.

## THE ROLE OF ENZYMES IN CHEMICAL CHANGES.\*

---

C. H. MARYOTT, B. S., PH. D.

---

Formerly it was thought that the chemical changes involved in the process of living matter sprung from a special vital force, unlike any of the material forces with which we are familiar. The assumption of this vital force was a natural sequel to the lack of knowledge concerning the nature of the changes involved in the growth and decay of plant and animal structures. Later as a number of products formerly obtained only from living organisms were made in the laboratory by familiar chemical methods, the need of any special vital agent disappeared, for it was seen that many of the chemical changes occurring in nature were not essentially different from those producible in the laboratory. The beauty and mystery of the transformations of plant and animal life, however, did not thereby suffer, for it was seen that each living cell constituted a laboratory most complete and wonderfully equipped, where reaction of the most complex nature was carried out with an ease that defied imitation. A study of the means by which these reactions are accomplished, has revealed the importance of a class of substances known as enzymes, elaborated by living cells. In their action they resemble the inorganic catalyzers and conform in general to the behavior of such.

A catalyzer is a substance which by its presence alters the rate of a chemical change, without taking, of itself, a permanent part in the reaction. There are many chemical changes going on around us which proceed so slowly under ordinary conditions that they are difficult or impossible of detection within a moderate length of time. Thus cane sugar dissolved in water, very slowly reacts with the water and yields dextrose and levulose. In the presence of hydrochloric acid, or of invertase, an enzyme procured from yeast, the change takes place rapidly, and under suitable conditions might be completed within a few hours. Neither the hydrochloric acid nor the invertase would be used up during the process, but would be present in the same amount and in the same condition after the reaction as they were before it. Likewise oxygen and hydrogen when mixed, under ordinary conditions, do not combine perceptibly, but if finely divided platinum is placed in the mixture, rapid union results, which may ignite the mixture.

Besides the fact that catalyzers accelerate reactions and that they undergo no permanent change themselves, there are several characteristics generally ascribed to them. One of the most conspicuous of these is the property which they possess of effecting an amount of chemical change out of all proportion to the amount of catalyzer used, the merest trace often causing a pronounced action; colloidal platinum will cause the decomposition of 1,000,000 times its weight of hydrogen peroxide, and invertase will act upon 200,000 times its weight of sugar.

Another characteristic of catalyzers of importance in connection with enzymes is the fact that catalytic agents do not affect the conditions of equilibrium in any

---

\* Read at a monthly meeting of Faculty and Senior Classes, Baylor University Colleges of Medicine and Pharmacy

chemical change. There are many reactions which do not proceed to completion, but the reaction apparently stops before all of the original reacting substances are combined. Thus fats will react with water to form glycerin and free fatty acids, but the reaction will come to an apparent halt before all of the fat is transformed. Under exact conditions there will be a definite ratio between the quantities of unchanged fat and the amounts of glycerin and free acid. The explanation of this condition is that we are dealing here not with a single reaction, but with two oppositely directed reactions, and each tends to undo the effect of the other. While it is true that fat and water react to give glycerin and acid, it is equally true that the glycerin and acid react to give the original fat and water.

The relative amount of fat that will be decomposed will be determined by the conditions of temperature and the concentration of the various substances present. Inasmuch as both of these reactions are influenced to the same extent by a catalyzer, the relative amounts of the substances present when equilibrium is reached will be the same whether a catalyzer is used or not. The fact that in such reversible reactions, the catalyzers affect with reactions alike, is of great importance physiologically, for it makes it possible that under certain conditions a substance such as a fat may be broken down by an enzyme into products which can be absorbed, and under different conditions, by this same enzyme, these products can be combined again. Thus in the body the same enzyme may effect decompositions, or it may bring about syntheses.

Though the fermentation of sugar containing solutions must have been the subject of a great deal of attention in very early times, it was not until nearly the middle of the nineteenth century that the production of alcohol and carbon dioxide was associated with the activities of the yeast cells, not until after Pasteur had completed his researches on the subject was full credence given to the belief that the yeast cell was the active instrument in alcoholic fermentation. Other ferments were known previous to that time for Reaumur as far back as 1752 had discovered the gastric enzyme pepsin, and Kirchoff in 1814 discovered the diastasic properties of sprouting barley. Emulsin and many other ferments were known. The catalytic nature of these enzymes was realized, for Berzelius in 1837 had compared them to the inorganic catalyzer, and had anticipated the tremendous importance which these enzymes have on vital processes. These enzymes just mentioned were held to act in an essentially different manner from those in yeast, lactic and butyric fermentations, which Pasteur had proved took place within the living cells and which were then believed to be possible only in conjunction with the living processes of these cells. Ferments were accordingly classified into organized and unorganized ferments. This classification prevailed until 1896, when Buchner showed that the activity of the yeast cells was due to a substance, which he called zymase, which could be separated from the cellular structure and which caused the breaking down of glucose into alcohol and carbon dioxide, independently of any living matter. The term "organized ferment" lost its original significance and since then all processes of fermentation have been looked upon as due to unorganized, non-living enzymes. At present enzymes are considered as intra-cellular or extra-cellular, depending upon whether their activity takes place normally within the living cell or outside of it.

The extra-cellular enzymes, those that are excreted into a fluid external to the cell, such as the common digestive enzymes, pepsin and trypsin, are the best known. Considerable difficulty surrounds the study of the intra-cellular enzymes, for in many cases it is impossible to separate them from the cells, and their activity must be studied while within the cell structure.

In the classification of the enzymes, they are usually grouped either according to the type of chemical reaction they accelerate, or according to the nature of the substrate that they act upon. Of the various chemical changes which take place in the living world that of hydrolysis is one of the most frequent and most important. Many substances, particularly plant and animal substances, when in the presence of water, react with the water, the molecules of the substance taking up water molecules and breaking down into simpler substances. Thus a cane-sugar molecule will react with a water molecule and break down into a molecule of dextrose and one of levulose. This process is very slow unless a catalyzer is present, but in the presence of even a very small amount of invertase, it takes place rapidly. The chemical process involved in the digestion of carbohydrates, proteins, and fats, is one of hydrolysis. Enzymes which bring about rapid hydrolysis are known as hydrolytic enzymes, and are spoken of as amylolytic, proteolytic or lipolytic, according to the substance they act upon. They are also sometimes classed as amylases, proteinases and lipases, the ending *ase* being a general suffix added to the name of the substrate. There are many other important hydrolytic enzymes besides those mentioned.

The oxidizing enzymes, or oxidases, form another widely occurring and important class, as they doubtless take an essential part in life processes. Closely related to the oxidases are the catalyses and peroxidases, which are nearly everywhere present in living matter. The catalases cause liberation of oxygen from hydrogen peroxide, and the peroxidases bring about oxidations in the presence of peroxides. These last are of particular interest, inasmuch as oxidation effected by hydrogen peroxide and the peroxides as a class, seem to resemble more closely the oxidations taking place in the tissues, than does any other type of oxidation, and it is thought probable that the peroxidases play a very important role in body metabolism. Little, however, of an exact nature is known about the metabolism enzymes. Other important groups are the sugar-splitting, or glycolytic, and protein-coagulating enzymes.

So far it has been impossible to separate any enzyme in a perfectly pure form, so that little of a definite nature is known regarding their chemical characteristics. They are all soluble in water, but are insoluble in strong alcohol, chloroform, acetone and the like. Glycerin dissolves most of them but not so well as does water. As they are colloidal substances and occur associated with protein matter, any attempt to precipitate them, throws them down always contaminated with large amounts of impurities from which it is impossible to separate them, as the methods that would be required for their purification destroys their activity. It is doubtless due to their colloidal nature and the tendency they therefore have to form adsorption compounds with other colloids, that many of the intracellular enzymes cannot be separated from the cell proteins.

The activity of enzymes is very markedly affected by slight changes in temperature. If raised above a certain temperature, usually about 50° C., their ac-

tivity rapidly falls off owing to a gradual destruction of the enzyme. All enzymes if in a moist condition are destroyed by boiling, though if in a dry state they may be heated, frequently to higher temperatures.<sup>1</sup> Each enzyme acts best at the temperature in which it acts in nature. For plant enzymes this is about 25° C., and for animal enzymes about 40° C.

Enzymes are likewise usually very sensitive to the reaction of the medium in which they function. Some, like pepsin, act best in a faintly acid solution, others, like trypsin, in one faintly alkaline, while some act best in neutral solutions.

There is at present some disagreement regarding the extent to which the activity of enzymes is specific. Some take the view that enzymes having similar actions are the same. Accordingly there is no ground for belief that any difference exists between the ptyalin of the saliva, and the starch-splitting enzymes of the pancreas, muscle tissue, or plants. Others incline to the view that each enzyme from a different source is different and that each is limited in its action to some particular substance. Without taking such an extreme view we can with safety conclude that there is a very high degree of specificity in enzyme action. Lipases do not act upon starch, amylases do not act upon protein, neither do proteinases act upon fats. While all lipases effect the same action on fats, namely their hydrolysis into glycerin and fatty acid, they do not all act equally well under like conditions. The lipase of the stomach acts best in a slightly acid medium, that of the pancreas occurs as a zymogen and is activated by the bile.

The work of E. Fisher shows that in the case of sugar, and the polypeptides that there is an intimate relationship between the optical properties of the molecules of the substrate and the enzyme that acts upon it. He has likened the action of enzyme on a substrate to that of a key on a lock. The indications are that enzymes act only on substances having a chemical resemblance to themselves. It appears that the action of an enzyme is limited to a certain arrangement or grouping within the molecule, and a given enzyme will act only upon substances possessing this grouping.

There is much evidence that enzymes in acting upon substances first form temporary compounds with them, these subsequently break down as the substance changes, the enzyme is set free and immediately forms a new union with other molecules of the substance.

Many of the most important enzymes do not exist in the cells in an active form, but are excreted, or zymogens which require activation by the enzymes. These activating agents are called co-enzymes. Thus enterokinase activates trypsinogen and forms trypsin. There is an interesting class of substances which inhibit the action of enzymes, and are called anti-enzymes. Thus in blood serum there exists a substance which destroys the action of trypsin and is known as anti-trypsin; substances can be extracted from intestinal worms which prevent the digestive enzymes from acting. Antiferments are also developed in the blood of animals which have been injected with solutions of enzymes. Whether these anti-enzymes are true enzymes, or whether they act by forming more stable compounds with the enzymes has not been definitely settled.

The methods by which enzymes are formed and their action controlled by

---

<sup>1</sup> For behavior of enzymes at low temperatures see article by Joseph Samuel Hepburn in this issue.

the cells are not known, but they without doubt form a most important class of agents, through which the chemical operations of life are accomplished. Many of the tissues are abundantly supplied with them. Twenty or more have been shown to be present in the liver. The kidney and muscle tissue are also widely supplied with them.

Among the more familiar processes in which enzymes take a prominent part might be mentioned those of digestion. Here a certain amount of adaptation of secretion to diet seems possible. Lactase, an enzyme present in the intestine of infants, is absent or present in negligible amounts in adults, but constant feeding of lactase results in a revival of its secretion. This adaptability of secretion to diet, may have an important bearing on the ill effects frequently produced by a sudden change in the character of the diet. The oxidizing enzymes have already been mentioned in connection with metabolism. There is one anomaly which finds a probable explanation in a defective enzyme action, namely that of alkaptonuria. Tyrosin and phenyl-alanin, products derivable from protein, are normally completely oxidized in the system, but in alkapton are oxidized only partially to homogentisinic acid. Diabetes may find an explanation in the failure of the glycolytic enzymes of the tissue to oxidize glucose. The clotting of blood, the softening of tissue by pus, the destruction of germs by the leucocytes, rigor mortis, and the softening of tissue by autolysis are familiar illustrations. The formation of urea, of dextrose from glycogen and of glycogen from dextrose, the breaking down of nucleic acid in purins, and the oxidation of the purins to uric acid are other cases, which could be greatly multiplied.

---

## THE BEHAVIOR OF ENZYMES AT LOW TEMPERATURES.\*

---

JOSEPH SAMUEL HEPBURN, A. M., M. S., PH. D.

---

The influence of low temperatures on enzymes is a subject of growing importance to the chemist, the biologist, and the bromatologist. Problems in this field may be studied from either the potential or the kinetic side; for either the resistance of an enzyme to, or its activity at, low temperatures may be investigated. Various researches, conducted during the last half century, have demonstrated that enzymes survive exposure to low temperatures and also act as catalysts at such temperatures. The reports of these researches are widely scattered in the literature; and frequently the original papers may be obtained for consultation only with difficulty. It is the purpose of this paper, which is based on primary sources, to give a *resume* of our present knowledge of this subject. One section is devoted to the resistance of enzymes to low temperatures, and one to their activity at such temperatures.

---

\* Communicated by the Author to the *Journal of the Franklin Institute*, and reprinted by permission. This contribution is based on a paper to be published by the writer in the *Biochemical Bulletin*, 1915, iv.

In this paper full details will be given of the researches of various investigators on the influence of low temperatures on enzymes, and a complete bibliography appended.

## THE RESISTANCE OF ENZYMES TO LOW TEMPERATURES.

The researches reviewed below demonstrate that the following enzymes survive exposure to low temperatures and again exert their usual catalytic power when brought into a suitable environment: diastase, inulinase, invertase, maltase, zymase, lipase, protease of plants, pepsin, trypsin, thrombin, rennin, oxidase, peroxidase, catalase, simple and aldehyde reductase. This order will be followed in presenting the data.

Solutions of *diastase*, *inulinase*, and *invertase*, after exposure for forty-five minutes to the temperature of liquid air (approximately  $-191^{\circ}$  C.), retained unaltered their power to hydrolyze starch, inulin, and sucrose, respectively. The diastase was obtained from human saliva and from *Aspergillus niger*; the inulinase from the *Aspergillus*; and the invertase from both the *Aspergillus* and beer yeast.

After yeast press juice had been repeatedly cooled to  $-2^{\circ}$  C., its *maltase* retained the power to invert maltose.

*Zymase* in yeast press juice survives complete freezing of the juice. The enzyme may be concentrated by cooling the juice to  $-2^{\circ}$  C. and removing the ice crystals from the solution of enzyme in the mother liquor. Zymase has been prepared by trituration of a mixture of solid carbon dioxide (carbon dioxide snow)<sup>1</sup> and dehydrated yeast cells for a period of one-half hour. It is resistant to a temperature of  $-182^{\circ}$  to  $-190^{\circ}$  C., that of liquid air; yeast cell plasma, held at that temperature for twenty hours, retained unchanged its power to produce alcoholic fermentation.

The *lipase* of a pig pancreas, which had been kept in cold storage at  $4^{\circ}$  C. for seven days, retained about forty percent of its power to hydrolyze ethyl butyrate. Lipase was found in fresh eggs which had been held at  $0^{\circ}$  C. for sixty-six days. It was present in the crude abdominal fat of a chicken kept at  $0^{\circ}$  C. for twenty-four hours after death, in that of chickens of known history held hard frozen for periods of twelve and one-half, thirteen, sixteen, twenty-eight, twenty-nine, and forty-two months at a temperature of  $-9.4^{\circ}$  to  $-12.2^{\circ}$  C., and in that of birds, whose history prior to freezing was unknown, kept at that temperature for periods of fifty-four and eighty-nine months.

The *protease* of plants survives freezing temperatures. Sprouting wheat seedlings, excoriated peas, excoriated germinating peas, etiolated caulis tops, etiolated leaves and green leaves of the bean *Vicia faba* were frozen, usually for twenty-four hours. Their proteases were still able to produce autolysis of the tissue proteins at room temperature.

Solutions of *pepsin* and *trypsin*, after exposure to the temperature of liquid air (approximately  $-191^{\circ}$  C.) for forty-five minutes, were practically unaltered in their ability to digest albumin.

The clotting enzymes *thrombin* and *rennin* likewise survive exposure to the temperature of liquid air. Thrombin of dog's blood held at  $-180^{\circ}$  C. for thirteen minutes retained in full its power to produce clotting of the blood.

Commercial rennet, kept at  $-180^{\circ}$  C. for periods of one, five, ten, and thirty

---

<sup>1</sup> The temperature of solid carbon dioxide vaporizing at ordinary atmospheric pressure is approximately  $-75^{\circ}$  C. (Richter *Inorganic Chemistry*, Fifth American Edition, p. 228.)

minutes, was entirely unchanged in its action on milk at 35° C. In another experiment a rennin solution, which was kept in boiling liquid air for over one hour, retained completely its power to produce clotting of milk.

*Oxidase* was present in milk held at 0° C. for as long as thirty-five days, and in cream held at that temperature for as long as twenty-eight days. Both milk and cream were rendered bacteriologically sterile by addition of 0.1 percent of formaldehyde before storage.

Both *oxidase* and *peroxidase* were found in the crude fat of a chicken kept at 0° C. for fifteen days after death, and in that of hard-frozen chickens, including birds of known history, kept in the freezer for nine months and birds, whose history prior to freezing was unknown, held in the freezer for periods of twenty-three and sixty-three months; the temperature of holding was  $-9.4^{\circ}$  to  $12.2^{\circ}$  C.

*Catalase* has been found in milk and cream rendered sterile by addition of 0.1 per cent of formaldehyde and held at 0° C. for twenty-one days. It has also been detected in eggs, including both the white and the yolk, after the eggs had been kept at 0° C. for sixty-five days.

*Catalase* has also been demonstrated in the crude fat of chickens of known history held hard-frozen for nine months at a temperature of  $-9.4^{\circ}$  to  $-12.2^{\circ}$  C., in sole kept frozen for nineteen to twenty-one days at  $-2^{\circ}$  to  $-9.5^{\circ}$  C., and in cod kept frozen for thirty days at  $-2^{\circ}$  to  $-6.5^{\circ}$  C.

*Simple reductase* has been found in formalized, sterile milk and cream kept at 0° C. for twenty-eight days; the cream also contained *aldehyde reductase*.

Simple reductase occurred in the crude fat of chickens of known history held hard-frozen for nine months, and in that of chickens, whose history prior to freezing was unknown, kept in the freezer for twenty-three months. Aldehyde reductase was present in the birds of the latter class after periods of twenty-three and sixty-three months in the freezer. The temperature of holding was  $-9.4^{\circ}$  to  $-12.2^{\circ}$  C.

#### THE ACTIVITY OF ENZYMES AT LOW TEMPERATURES.

Studies have been made of the activity of the following enzymes at low temperatures: invertase, maltase, zymase, diastase, lipase, pepsin, trypsin, galactase, urease, rennin. This order will be followed in presenting the data. At times the enzyme studied was permitted to produce an autolysis, at times to act in solution on an artificial medium, at a given low temperature.

*Invertase*, *maltase*, and *zymase* are active at the temperature of an ice-box, for yeast press juice ferments saccharose, maltose, glucose, and fructose at that temperature.

The *diastase* of carp liver acts on starch at 0° C., converting it first into soluble starch, then into erythrodestrin, and finally destroying the latter compound.

The *lipase* of pig pancreas has been shown to hydrolyze ethyl butyrate at 0° C., and to hydrolyze neutral lard at  $-9^{\circ}$  to  $-12^{\circ}$  C. The lipase of pig liver splits ethyl butyrate at 0° C. and at  $-10^{\circ}$  C. The lipase of crude chicken fat produces hydrolysis of ethyl acetate, butyrate, and benzoate and amyl salicylate at 0° C. and at a temperature of  $-6.7^{\circ}$  to  $-9.4^{\circ}$  C.

*Pepsin*.—The gastric protease of the frog, the pike, and the trout digests albumin at 0° C.; that of the frog also digests fibrin at 0° C., while that of the pike produces proteolysis of fibrin at temperatures as low as 0° C. Pepsin of pig's stomach converts coagulated ovalbumin into acid albumin, albumoses, and peptones at 0° C. Pepsin also digests ricin at that temperature.

*Trypsin*, derived from the intestinal tract of the carp, gave rise to proteolysis of gelatin and of fibrin at 0° C.

*Galactase*, the trypsin-like enzyme of milk, gives rise to a proteolysis in Cheddar cheese which is ripened at 15° F. (−9° C.), 25° to 30° F. (−1° to −4° C.), and 33° F. (+0.6° C.). Galactase also produces proteolysis in milk rendered sterile by addition of 0.1 percent of formaldehyde and held at 0° C. The digestion of the proteins observed in milk kept at −9° C. has been ascribed to the action of galactase.

*Urease* of the soy bean hydrolyzed urea at temperatures as low as 0° C.

When *rennin* acts on milk it first transforms the casein into paracasein and then precipitates the latter compound as a coagulum. The first stage of the reaction occurs at 0° C.; the second stage likewise takes place at that temperature, but the precipitate separates in a finely-divided condition without the formation of a distinct curd.

#### SUMMARY.

The power to survive prolonged exposure to low temperatures is possessed by various enzymes, including those producing hydrolysis of fats, of carbohydrates, and of proteins, those concerned in biochemical oxidations and reductions, the clotting enzymes and that of alcoholic fermentation. The enzymes retained their catalytic power after exposure, either *in situ* or in solution *in vitro*, to temperatures varying from a few degrees above 0° C. to the temperature of liquid air (−180° to −191° C.). The shortest periods of holding, invariably less than one day and usually less than one hour, were at the temperature of liquid air. The longest period of holding was eighty-nine months at a temperature of −9.4° to −12.2° C.

The activity of certain of these enzymes, including rennin, zymase, and those hydrolyzing fats, carbohydrates, and proteins, has been studied at low temperatures, varying from that of an ice-box to one of −9° to −12° C. While the enzymes produced autolytic digestion or acted on artificial media at these temperatures, the velocity of the reaction was always lessened to a considerable degree.

COMPARISON OF THE PHARMACOPŒIAL METHODS FOR THE  
DIGESTIVE FERMENTS AND ANIMAL PRODUCTS ADOPTED  
BY THE DIFFERENT COUNTRIES.\*

HOWARD T. GRABER.

In January, 1817, Dr. Lyman Spalding of New York City, submitted to the Medical Society of the County of New York, a project for the formation of a National Pharmacopœia, and on December 15, 1820, the first issue of this national volume was published in Boston, in both Latin and English. There have been eight revisions since this first volume appeared, and the present book stands pre-eminent as a national standard, having been adopted by the United States Department of Agriculture.

Section 7 of the Food and Drugs Act of June 30, 1906, states: "In the case of drugs, if where a drug is sold under or by a name recognized in the United States Pharmacopœia or National Formulary, it differs from the standard of strength, quality or purity, as determined by the test laid down in the United States Pharmacopœia or National Formulary, official at the time of investigation, it is deemed to be adulterated unless said difference is plainly stated on the label." Nor is the United States alone in its publication of such an official standard; indeed, each nation has its own standard volume. In France they have the French Codex, in Germany the *Arzneibuch*, in Japan the Japanese Pharmacopœia, and in England and her colonies the British Pharmacopœia, etc.

I shall not attempt a general comparison of these various books, but will confine myself to the requirements of the various governments for the standardization of the digestive ferments and animal products.

The digestive ferments which have received almost universal recognition are pepsin, pancreatin and diastase, and of the allied animal products desiccated thyroid glands, oxgall, both pilular and purified, and peptone have been recognized.

PEPSIN.

Taking up the consideration of the enzyme pepsin, it is found that three nations, namely, the United States, Germany and Japan, evaluate the proteolytic value of this ferment by its digestion on boiled egg albumen; the country utilizing a different proteid being France, which has adopted as a proteid, washed fibrin from pig's blood, strained by hand and desiccated at 40° C., either in a warm closet or in a draught of warm air, then pulverized.

The official strengths vary from 1:400 to 1:3000, and the time of digestion from two to six hours.

The following chart illustrates the essential details of the various tests:

---

\* Read before the Detroit Section of the American Chemical Society.

Country	Pepsin gm.	PROTEID			Des. Fibrin Amount	Media for Digestion	Time Digested	Temperature	Official Strength	When	Kind Official	Animal Used
		Poiled	Egg Albumen	Texture								
U. S. A.	.00335+ gm. An Essence of Pepsin N. F., each fluid drachm of which contains 1 grain of 1:3800 Pepsin	15 min.	10 gms.	Through sieve No. 40		40 cc. .2% HCl	2½ hours	52° C.	1:3000	Insoluble residue after standing ½ hour does not measure more than 1 cc.	Scale, Grain or Powder	Pig
England	.005 gm. Glycerin of Pepsin, each fluid drachm of which contains 5 grams of official Pepsin	15 min.	12.5 gms.	12 meshes to cm. No. 4		125 cc. .2% HCl	6 hours	40½° C.	1:2500	Only a few small flakes remaining	Grains, Scales, Powder	Pig, sheep or calf
Germany	0.1 gm. Mixture made by mixing 65 parts by weight of Pepsin and 935 parts by weight of Sugar, pure	10 min.	10 gms.	No. 60 sieve		100.5 cc. .2% HCl	1 hour	45° C.	1:4000 (U. S. P.) 1:1535 (J. P.)	Albumen must have dissolved	Saccharated	
Japan	0.1 gm.	About 6 min.	10 gms.	No. 4		100.5 cc. .15% HCl	2 hours	45° C.	1:600 (U. S. P.) 1:100 (J. P.)	Albumen almost completely digested. Moisture not over .5%. Ash not over .5%	Saccharated only	Hog or cattle
France	0.1 gm.			Pulverized	2½ gm. Desiccated pig Fibrin	60 grams .256% HCl	6 hours	50° C.	1:3000 (U. S. P.) 1:600 France	10 cc. of the cold and filtered digested solution should not at the ordinary temperature become cloudy by the addition of 20 drops of HNO <sub>3</sub> (sp. grv. 1.394 @ 15° C.)	Thick paste, powder or scales Amylaceous and Lactated Pepsin	

As to the general physical characters, they all agree that the pepsin should be soluble in water and also alcohol of 20 to 30 percent strength and insoluble in strong alcohol.

#### PANCREATIN.

Pancreatin, the second enzyme to be considered, is as the name implies, a mixture of the enzymes naturally existing in the pancreas of warm-blooded animals and consisting principally of amylpsin, trypsin, steapsin and myopsin. Of this mixture amylpsin, or the starch digester, and trypsin, or the pancreatic proteolytic ferment, are the only two enzymes which are officially standardized; and the same difference is noted with the methods adopted for trypsin as for pepsin, namely, three of the countries under discussion have adopted cow's milk as the medium for tryptic estimation, while one, France, uses the desiccated blood fibrin from pig's blood.

The chart on the next page illustrates the official methods for determining the tryptic value of a pancreatic product.

Of the animal products recognized are oxgall and thyroid glands; with peptone official in the French Codex only:

#### OX GALL PURIFIED.

Country	Description	Character of Product	Odor	Taste	Official Tests and Requirements Should be
U. S. A.	Evaporated Gall of Ox	Yellowish Granular soft solid	Peculiar	Partly bitter. Partly sweet.	Completely soluble in water. Completely soluble in 91% alc. Completely soluble in 50% alc. Sulphuric acid identification test.
England	Evaporated Ox Gall	Yellowish Granular Hygroscopic substance	Peculiar	Partly sweet. Partly bitter.	Completely soluble in 50% alc. and water. Also aqueous soln. gives no precipitate upon the addition of 90% alcohol. Usual $H_2SO_4$ identification test.
Japan	Evaporated Ox Gall				No official purified product. A crude evaporated gall is official with an ash requirement of 8.10% solid residue.
Germany					No official product.
France					No official product.

#### DESICCATED THYROID GLAND

Country	Animal	Character	% Composition	Ash	Standard Requirements
U. S. A.	Sheep	Yellowish Amorphous Powder	1 part represents approximately 5 parts of fresh gland	Not over 6%.	Qualitative test for presence of organic iodine, also absence of inorganic iodine. (9th Revision 17-23% Iodine)
British	Sheep	Light dull brown powdery or turbid liquid	100 minims, or 6 ccs. represents 1 dr. Pinkish entire gland		
Japan					No official product
France					No official product
Germany					No official product

## PANCREATIN—TRYPSIN ESTIMATION.

Country	Official Product	Amount Enzyme gms.	Amount NaHCO <sub>2</sub> gms.	Dissolved in	Amount Milk	Digested at	Time Digested	Requirement to be Official
U. S. A.	Powder	.28	1.5	100 cc. Tepid water	400 cc.	38° C.	30 mins.	Small portion mixed with three times its volume of water and some Nitric acid added should produce no coagulation.
England	Liquid	2 cc.	0.2 gm.	20 cc. Water	80 cc.	45° C.	1 hour	Coagulation should no longer occur upon addition of Nitric acid.
Japan	Powder	.28	1.5	100 cc. Tepid water	400 cc.	38° C.	30 mins.	Requirement same as U. S. P.
Germany								Not official.
France	Powder	0.2 gm.		60 gms. Distilled Water	2.5 gms. Digestated Fibrin or 10 gms. dried in air.	50° C.	6 hours	Filter:—10 cc. of clear liquor should not become cloudy by the addition of 20 drops of Nitric acid. (Sp. Grv. 1.394 at 15° C.)

## PANCREATIN—ESTIMATION OF AMYLOPSIN.

Country	Amount Ferment	Official Product	Starch grams	Distilled Water	DIGESTED		Iodine Solution	End Point
					Time	Temperature		
U. S. A.	0.3 gm.	Powder	7.5 gms.	200 cc.	5 mins.	40.5° C.	2 drops N:10 I. in 60 cc. water.	Converted into substances soluble in water. Four drops of converted starch solution should give no color, or at most only a wine red when added to the iodine solution. Under these conditions 1 part pancreatin digests 25 parts of starch.
England								Not official.
Germany								Not official.
Japan								Not official, see Japan Pharm. Diastase (See below).
France	.05 gm.	Powder	5 gms. Potato	100 cc. Water	1 hour	55° C.		A fluid liquid is obtained which, when filtered, reduces 4 times its volume of Fehling's solution.
DIASTASE.								
Japan	.05 gm.	Powder	5 gms. Potato	100 cc. Water	2 hours	55° C.		10 cc. of digested starch solution should completely decolorize 40 cc. Fehling solution.

The last product to be considered is peptone, and this is recognized by but one nation, namely, France, under the title *Peptone Medicinal*.

It is official as a pancreatic or peptic digestive product of albuminoids; is almost completely soluble in water, not coagulated by heat nor by the addition of nitric acid; it has a peculiar odor and a bitter taste when made by pancreatic digestion and a bitter and saline taste when made by peptic digestion.

A perusal of the before mentioned variations in the official methods adopted for the standardization of animal products by the various countries, shows that physiological chemists in general have not as yet adopted uniform methods along this line of chemistry. I predict, however, that with the advent of the next issue of the *United States Pharmacopœia* our foreign neighbors will admit our superiority not only in the manufacture of this important line of pharmaceuticals, but also in their standardization, and will adopt not only our products but our methods as well.

---

## STANDARDIZATION OF SODIUM THIOSULPHATE VOLUMETRIC SOLUTION.\*

---

JOSEPH L. MAYER.

---

A reference to page 563 of the U. S. P., will show that the official method of standardizing sodium thiosulphate V. S., is to employ a decinormal solution of potassium dichromate proceeding as follows:

"To a solution of about 1 gm. of potassium iodide (*Potassii Iodidum*, U. S. P.), in 10 cc. of diluted sulphuric acid contained in a flask of about 500 cc. capacity, add slowly, from a burette, 20 cc. of tenth-normal potassium dichromate V. S., shaking after each addition. Place a watch-glass on the mouth of the flask and allow it to stand for five minutes, then dilute the solution with about 250 cc. of distilled water, add some starch T. S., and then, from a burette, the trial solution of sodium thiosulphate, in small portions at a time, shaking after each addition, and, toward the end of the operation, reducing the flow to drops, until the blue color of the mixture changes to a light green; note the number of cc. of the trial sodium thiosulphate solution consumed. Then dilute the sodium thiosulphate solution so that equal volumes of it and the tenth-normal potassium dichromate V. S. will exactly correspond to each other under the above conditions, at 25 deg. C. (77 deg. F.)."

On page 549 of the U. S. P., volumetric iodine solution is directed to be made by the following:

Tenth-normal iodine V. S. may be prepared according to either of the following methods:

"1. Dissolve 12.59 gm. of pure iodine (see below) in a solution of 18 gm. of potassium iodide in 300 cc. of water. Then add sufficient water to make the solution measure, at 25 deg. C. (77 deg. F.), exactly 1000 cc. Unless freshly prepared, its strength should always be determined anew at the time it is used. Transfer the solution to glass-stoppered vials.

*Preparation of Pure Iodine.* Heat powdered iodine (*Iodum*, U. S. P.), in a porcelain dish placed over a bath of boiling water for twenty minutes, and stir it constantly with a glass rod, so that adhering moisture, cyanogen iodide, and most of the iodine bromide and iodine chloride, if present, may be vaporized. Then transfer the iodine to a porcelain or other non-metallic mortar, and triturate it with about 5 percent of its weight of dry potassium iodide, so as to decompose any remaining iodine bromide and iodine chloride. Then return the mass to the dish, cover it with a glass funnel, and heat the dish carefully on a sand-bath. Detach the

---

\* Read before the Kings County Pharmaceutical Society, March 9, 1915.

sublimed, pure iodine, and, after pulverizing and drying for twenty-four hours over calcium chloride, keep it in well-stoppered bottles, in a cool place."

Since N/10 Iodine is the exact equivalent of N/10  $\text{Na}_2\text{S}_2\text{O}_3$ , the U. S. P. on page 550 gives as an alternative method of preparing the N/10 Iodine the following:

"Dissolve about 14 gm. of iodine (Iodum, U. S. P.), in a solution of 18 gm. of potassium iodide (Potassii Iodidum, U. S. P.), in about 300 cc. of water, diluting finally to 1000 cc. Of this solution (which is too concentrated), carefully measure from a burette 10 cc. into a flask, then add gradually and cautiously, from a burette, tenth-normal sodium thiosulphate V. S. (shaking constantly) until the color of the solution is discharged. Note the number of cc. of the sodium thiosulphate V. S. consumed, and then dilute the iodine solution so that any known volume of the latter will require for decolorization exactly the same volume of the tenth-normal sodium thiosulphate V. S."

This indicated to me that the factor for  $\text{Na}_2\text{S}_2\text{O}_3$  V. S. standardized by either potassium dichromate or resublimed iodine would be the same, and to determine whether such was actually the case the following work was undertaken: A N/10  $\text{K}_2\text{Cr}_2\text{O}_7$  V. S. was made up by the following method on page 551 of the U. S. P. employing Kahlbaum's Salt.

"Dissolve 4.8713 gm. of pure potassium dichromate, which has been pulverized and dried at 120 deg. C. (248 deg. F.), (see Reagent No. 85), in sufficient water to measure, at 25 deg. C. (77 deg. F.), exactly 1000 cc."

The  $\text{Na}_2\text{S}_2\text{O}_3$  V. S. standardized against this had the factor recorded in tabulation below.

Another lot of N/10  $\text{K}_2\text{Cr}_2\text{O}_7$  made up by the same method using Baker's salt, the same  $\text{Na}_2\text{S}_2\text{O}_3$  V. S. had the factor noted below.

Small amounts of Iodine prepared as directed under V. S. iodine were weighed off and after solution in water with the aid of KI employed to standardize the  $\text{Na}_2\text{S}_2\text{O}_3$  sol.; the factor is recorded below.

Iodine prepared as directed by the U. S. P. under V. S. Iodine was mixed with KI placed in a small porcelain crucible, heated on a sand bath until copious evolution of iodine fumes. Then one of a set of watch glasses with ground edges, which were tared with a clip, was slipped over the top of the crucible until a sufficient amount of iodine had sublimed; after cooling, the watch glasses, clip and iodine were weighed again. The increase in weight being iodine. The watch glasses and iodine without clip were then put into a few cc. KI solution, and when the iodine was dissolved the  $\text{Na}_2\text{S}_2\text{O}_3$  V. S. was run in until the reaction was complete. The factor for the  $\text{Na}_2\text{S}_2\text{O}_3$  solution is noted.

Factor employing Kahlbaum's Chemical 1 cc.=.011342 grammes iodine.

1 cc.=.9009 cc. N/10  $\text{Na}_2\text{S}_2\text{O}_3$  V. S.

Baker's Chemical 1 cc.=.011362 grammes iodine.

1 cc.=.9025 cc. N/10  $\text{Na}_2\text{S}_2\text{O}_3$  V. S.

Iodine resublimed on funnel 1 cc.=.011539 grammes iodine.

1 cc.=.91652 cc. N/10  $\text{Na}_2\text{S}_2\text{O}_3$  V. S.

Iodine resublimed on watch glass 1 cc.=.011533 grammes iodine.

1 cc.=.91604 cc. N/10  $\text{Na}_2\text{S}_2\text{O}_3$  V. S.

These results indicate that the use of resublimed iodine gives higher and probably more accurate results than the potassium dichromate method.

I am fully aware of the fact that the potassium dichromate used for standardi-

zation is usually directed to be checked against pure iron as is evidenced by the following citation from page 136, U. S. Dept. Agr. Division of Chemistry, Bul. 107, revised, under the determination of the iodine number of fats and oils.

*"Decinormal potassium bichromate.*—Dissolve 4.9083 grammes of chemically pure potassium bichromate in distilled water and make the volume up to 1 liter at the temperature at which the titrations are to be made. The bichromate solution should be checked against pure iron."

But of course this requires another determination and further complicates the standardization of the  $\text{Na}_2\text{S}_2\text{O}_3$  V. S.

In view of the close duplicates obtained by the use of resublimed iodine and simplicity of employing the watch glasses and clip method, I would suggest this as the most satisfactory means of accurately standardizing  $\text{Na}_2\text{S}_2\text{O}_3$  V. S.

The sodium thiosulphate solution was made by taking 4 liters of distilled water, boiling until all air and  $\text{CO}_2$  were expelled, placing in a large amber-colored bottle, and when cool, dissolving about 100 grammes of C. P. sodium thiosulphate in the liquid.

The bottle was set away in a dark place until ready for use (about six weeks). When a syphon tube with pinch cock was inserted and a layer of neutral liquid petrolatum placed on top of the liquid, by blowing into a hollow glass tube in the other hole of the rubber stopper the syphon was started.

Making up the solution by using distilled water from which the air and  $\text{CO}_2$  are expelled, allowing to stand until decomposition and precipitation has taken place, covering with a layer of liquid petrolatum and syphoning off the quantities of solution required makes an ideal method of handling not only this volumetric solution but very many others, it being our practice to follow this method whenever possible.

RESEARCH AND ANALYTICAL DEPARTMENT RIKER LABORATORIES.

## A PROFESSIONAL "SIDE LINE" FOR THE PHARMACIST.\*

J. M. ROGOFF, PH. G., M. D.

The introduction into therapeutics, of antitoxins, vaccines, serums, bacterins, etc., and the principles inculcated in the "Therapia Sterilans Magna" with the advent of Ehrlich's Salvarsan and Neo-Salvarsan have had a marked influence upon the prescription department of the pharmacist, and, for self-preservation, he has turned to commercialism and has converted his pharmacy into a miniature department store, instead of taking the more logical and ethical course of preparing to supply the physician with these new therapeutic agents, which have replaced so many of the old ones that at one time made the prescription department most remunerative.

In this paper, I do not aspire to the dubious distinction of originality, but will merely attempt to illustrate that the pharmacist can, with a little additional prepa-

\* From a paper read before the Nashville Branch A. Ph. A., February 17, 1915.

ration, and without investment of much money, add to his store a profitable and ethical professional "side line," which will bring him into closer relationship with the physician and improve his prescription patronage indirectly, as well as partly remunerate him for the loss of some of the prescription work that has been replaced by the use of other agents.

The modern pharmacist can easily equip himself with the necessary knowledge and apparatus to do for the physician, the simpler chemical tests that are used in clinical diagnosis, i. e., ordinary urine analysis, gastric analysis, etc.

Believing that the practice of such a side line by the pharmacist would be a step in the progress of advancement of the profession, I will present to you this paper, which if met by your approval will be followed by other similar papers that might constitute an introductory course of instruction, which if added to the pharmacist's knowledge of chemistry and chemical technique, will aid you to perform these tests, and thus legitimately serve the physician and the public in an ethical manner.

In this paper, microscopical tests are not included, being limited to the chemical tests that can be performed by any intelligent pharmacist.

The apparatus and the reagents required for this work are simple and inexpensive and most of them are found in every pharmacy. The following apparatus is sufficient for most of this work: Burette and holder, pipettes, beakers, funnels, test tubes, sedimentation glasses, evaporating dishes, Bunsen burner or alcohol lamp. The reagents will be mentioned with the various tests.

I will consider the analysis of the gastric contents to begin with. The physician desires a qualitative and quantitative analysis, and I will group the easily performed tests into these two subdivisions.

#### A. Qualitative tests:

1. Quantity, odor, appearance (blood, pus, undigested food, mucus, etc.).
2. Reaction: Litmus test.
3. If reaction is acid, determine if acidity is due to free acids: Topfer's reagent (one percent alcoholic solution of dimethylamidoazobenzol) is most commonly employed; this gives a red color, if free acid is present.
4. If free acid is indicated, determine if this is mineral (hydrochloric) or organic (lactic):

#### GUENZBERG'S REAGENT.

Phloroglucin .....	1 part
Vanillin .....	2 parts
Alcohol .....	100 parts

A few drops of this reagent mixed with  $\frac{1}{2}$  to 1 cc. of filtered gastric juice and evaporated in a porcelain capsule will produce a red color as the mixture evaporates, (avoid excessive heat) if free mineral acid is present.

#### BOAS' REAGENT.

Resorcin .....	10 parts
Cane Sugar .....	5 "
Alcohol .....	5 "
Water, q. s. ....	100 "

This reagent is used as Guenzberg's, and the results obtained are similar if free mineral acid is present.

5. Organic Acid:—(lactic) Uffelmann's Reagent ( $2\frac{1}{2}\%$  aqueous solution until the mixture becomes of an amethyst color). A few cc. of gastric contents are added to about 5 cc. of the reagent in a test tube, and if organic acid is present, a yellowish color will replace the bluish color; if mineral acid is present, a colorless solution will result. Therefore, if free mineral acid has been found to be present by test number 4, it is necessary to separate the organic to properly perform this test; this can easily be accomplished by shaking the gastric contents (a few cc.) with ether, which will extract the organic acid away from the mineral acid, and when the ethereal layer is evaporated (spontaneously) the residue can be dissolved in distilled water and Uffelmann's reagent applied.
  6. Starch: Iodine solution, or Lugol's solution (a few drops) gives a blue color.
  7. Erythrodextrin: Iodine solution, or Lugol's solution, gives a reddish color.
  8. Maltose: Fehling's, or Haines' solutions (a few cc.) boiled with a few cc. of the gastric contents will be reduced and a heavy reddish or reddish brown precipitate will appear.
  9. Propeptone: a. Primary proteoses are precipitated by one-half saturation with ammonium sulphate.  
b. Secondary proteoses are precipitated by complete saturation with ammonium sulphate.
  10. Peptone: The Biuret Test: This is performed by the addition of dilute cupric sulphate solution, then adding NaOH or KOH solution in excess (i. e., until distinctly alkaline) a pink color indicates peptone, violet indicates other soluble proteins. This reaction is sometimes enhanced by the aid of slight heat.
  11. Pepsin: A few shreds of freshly, coagulated egg albumen are added to a few cc. of (acidulated to 0.4%) gastric contents and its digestive quality noted.
  12. Rennin: 5 cc. of gastric content should completely curdle about 15 cc. of milk in from about 10 to 15 minutes, when kept at incubation temperature.
- B. Quantitative tests.
1. Free HCl: Titrate with N/10 or N/20 NaOH, using Topfer's reagent as an indicator.
  2. Combined HCl: Titrate with N/10 or N/20 NaOH, using alizarin as an indicator, then deduct the results of this titration from the total acidity.
  3. Total Acidity: Titrate with N/10 or N/20 NaOH, using phenolphthalein as an indicator.
  4. Organic Acids: Extract a known quantity of gastric content with ether, then titrate the residue for total acidity; this result deducted from the total acidity before extraction of the organic acid with ether will indicate the quantity of organic acid.
  5. Pepsin: Digestive influence on Mett's tubes.

## A POSSIBLE SOURCE OF ERROR IN SOME ALKALOIDAL ASSAYS.\*

---

P. A. W. SELF, B. SC., F. I. C.

---

A short time ago, as the result of an accident, my attention was directed to the interaction which, in favorable circumstances, may take place between free alkaloids and ammonium salts, and to the error which may arise from this cause in alkaloidal assays where the alkaloid is titrated. Although there does not appear to be any probability that a capable and experienced analyst ever falls a victim to this possible source of error, yet it appears quite worthy of notice, since it is certainly not generally recognized, while, at the same time, it may easily produce serious inaccuracies in the work of any one who is somewhat inexperienced in alkaloidal determinations.

That certain of the alkaloids have the power of expelling ammonia from its salts is fairly well known, but it does not appear to be equally well known that probably this power is possessed—to some extent and in suitable circumstances—by nearly all alkaloids. Ammonia, it is true, is a much stronger base than most fixed alkaloids, but its great volatility largely counterbalances this fact, for it is a matter of common knowledge that a feeble base or acid is capable—in conditions allowing interaction—of expelling from combination a much stronger member of its class, if the former is fixed and the latter volatile, at the temperature employed. A good example of this is given by the process of glazing earthenware, where, at the high temperature used, the extremely feeble acid, silicic acid, is able to decompose sodium chloride, with formation of sodium silicate, and expulsion of the very strong (but volatile) acid, hydrochloric acid.

Now, in an alkaloidal assay, if the alkaloid is liberated by *ammonia* and the volatile solvent employed in the final shaking-out is not washed with water, but is run directly into a dish and evaporated, there is considerable danger of a small volume of the aqueous layer (containing an ammonium salt) being carried into the dish with the alkaloid. This may happen in two ways: in the first place, by carelessness in the separation of the two layers of liquids, and, secondly, by a little of the ammoniacal solution clinging to the sides of the separator being carried down mechanically by the friction of the issuing stream of solvent; in either case, during the final stage of the evaporation, we have in the dish free alkaloid in contact with a solution of ammonium salt. The natural result is that, as pointed out above, a certain amount of interaction takes place (the extent of this being dependent on several circumstances), with consequent loss of ammonia and formation of an alkaloidal salt. The residue finally obtained, therefore, consists of a mixture of free alkaloid and alkaloidal salt, and the titration, of course, only gives the amount of the former.

It is interesting to note that here the result obtained is *too low*, whereas when the alkaloid is not titrated, but *weighed*, the introduction of ammonium salt causes the result to become *too high*. The error in the case of titration may,

---

\* The Pharmaceutical Journal and Pharmacist, May, 1915.

however, be much more serious than when the alkaloid is weighed, since owing to the high molecular weights of all alkaloids, a very small quantity of a salt of ammonia is capable of causing the neutralization of a comparatively large weight of free alkaloid if interaction is complete. Thus one part of ammonium chloride will interact with 12 parts of aconitine, 5.4 parts of atropine, or 6.3 parts of strychnine.

In order to ascertain the degree of error which may result from the cause under consideration, in alkaloidal assays, a number of quantitative experiments were made, with the following results:

In the first series of experiments, weighed amounts of pure alkaloids were dissolved in a little chloroform or ether, a small quantity of a weak solution of ammonium chloride added, and the whole evaporated to dryness on a water-bath and titrated in the usual way. In each case a similar experiment was performed, in which the ammonium chloride was omitted, in order to eliminate any other error and check the purity of the alkaloid.

The results obtained, together with fuller details of each individual experiments, are given in Table I.

It will be seen from the Table that the interaction was greatest in the case of atropine, the reaction being practically complete in both experiments. With aconitine the larger amount of apparent loss in the second experiment was probably due to the use of ether causing better contact between the reacting substances than when chloroform was employed, a result which might very well be expected. Strychnine gave least interaction, this no doubt being due to its extreme insolubility in water rendering contact with the ammonium chloride very difficult. In all the experiments, however, considering the minute quantities of ammonium chloride used, the apparent loss of alkaloid was comparatively large.

TABLE I.

Alkaloid Used	Details of Experiment	Amount Taken	Amount Found by Titration	Apparent Loss
Atropine ...	Alkaloid dissolved in 5 mils of ether, and about 1 milligrammes of ammonium chloride in 1 mil of water added, .....	0.0189 gm.	0.0213 gm.	0.0216 gm.
Atropine ...	Alkaloid dissolved in 5 mils of chloroform, and about 2 milligrammes of ammonium chloride in 0.5 mil of water added, .....	0.0451 gm.	0.0333 gm.	0.0118 gm.
Aconitine ...	Alkaloid dissolved in 3 mils of chloroform and about 1 milligrammes of ammonium chloride in 1 mil of water added, .....	0.0925 gm.	0.0839 gm.	0.0086 gm.
Aconitine ...	Alkaloid dissolved in 10 mils of ether and about 2 milligrammes of ammonium chloride in 0.5 mil of water added, ....	0.0502 gm.	0.0336 gm.	0.0166 gm.
Strychnine	Alkaloid mixed with 3 mils of chloroform and about 8 milligrammes of ammonium chloride in 2 mils of water added, .....	0.0256 gm.	0.0809 gm.	0.0117 gm.
Strychnine...	Alkaloid mixed with 10 mils of ether and about 2 milligrammes of ammonium chloride in 0.5 mil of water added, ...	0.0479 gm.	0.0451 gm.	0.0028 gm.

A few assays of belladonna leaves were next carried out, using the method of the present Pharmacopœia (Br.), but in some experiments washing the chloroform used in the final extraction, with water, and in others allowing small quantities of the aqueous layer to pass into the dish with the alkaloids. The method adopted for the purpose of eliminating any possibility of variation in the first stages of the assay, in comparative experiments, was as follows:

Fifty grammes of the powdered leaf were taken, the extraction with ether-chloroform and shaking-out with acid performed with five times the pharmacopœial quantities of all the reagents, and the acid extract then made up to 250 mls; 50 mls of this liquid were taken for the final stage of each separate experiment, and the exact volumes of chloroform prescribed by the Pharmacopœia used in shaking-out. Three samples of leaf were employed, and the circumstances were varied, as described in Table II.

In experiments (3) and (4) the separation of the chloroform was done with great care, the only aqueous liquid carried into the dish being that unavoidably removed from the sides of the separator by friction, as explained above; the results are, however appreciably low. In experiments (6), (7), and (9), small quantities of the aqueous layer (containing, of course, some ammonium sulphate) were added intentionally, the other circumstances being the same as in experiments (3) and (4), and in all three cases the errors produced were very serious. It is worthy of note that in this assay the fact that ether is added to the alkaloidal residue and then evaporated off again appears to increase any error due to the presence of ammonium salt by promoting better contact, since the apparent loss in experiment (9), where no ether was used, was comparatively much smaller than in experiment (6).

TABLE II.

Number of Sample	Number of Experi.	Circumstances of Experiment	Percentage of Alkaloid Found	Error
I.	1	Chloroformic solution of alkaloid washed with water .....	0.295	—
	2	Chloroformic solution of alkaloid washed with water .....	0.289	—
	3	Chloroform run very carefully into dish without washing .....	0.278	0.014
	4	Chloroform run very carefully into dish without washing .....	0.278	0.014
II.	5	Chloroformic solution of alkaloid washed with water .....	0.402	—
	6	As expts. (3) and (4), but about 0.3 mil. of aqueous layer run into dish in addition .....	0.197	0.205
	7	As expt. (6), but 0.5 mil. of aqueous layer added .....	0.191	0.211
III.	8	Chloroformic solution of alkaloid washed with water .....	0.278	—
	9	As expt. (6), but 0.25 mil. of aqueous layer added, and alkaloid not treated with ether finally.....	0.208	0.070

It is therefore quite evident, from the figures obtained in both sets of experiments, that in any alkaloidal assay in which the alkaloidal residue is titrated great

care must be exercised to avoid the introduction into the latter of even as little as 1 milligramme of an ammonium salt—that is to say, it is extremely advisable to wash the solution of alkaloid in volatile solvent with water.

From this point of view it is somewhat unfortunate that in the pharmacopœial assay processes for belladonna leaf and tincture and dry extract of belladonna no directions are given for washing the chloroformic solution of alkaloid before evaporation and titration, while it is certainly very difficult to understand why the precaution which was omitted in these cases should have been taken in the assay of liquid extract of belladonna. With regard to aconite and its preparations, while the prescribed filtration of the ether, if properly carried out, appears to render any appreciable error unlikely, yet great care must be taken that none of the aqueous layer passes through the filter, otherwise owing to the high molecular weight of aconitine, a very serious error may result.

---

THE VARIATION CLAUSE OF THE FOOD AND DRUGS ACT.\*  
SOME REASONS FOR THE EXISTENCE OF THE CLAUSE AND AGAINST ITS REPEAL.

---

J. H. BEAL, URBANA, ILL.

---

Section Seven of the Federal Food and Drugs Act declares that a drug shall be deemed to be adulterated if, when "sold under or by a name recognized in the United States Pharmacopœia or National Formulary, it differs from the standard of strength, quality or purity, as laid down in the United States Pharmacopœia or National Formulary official at the time of investigation."

To this declaration the so-called variation clause is attached in the form of a proviso which reads, "*Provided*, That no drug defined in the United States Pharmacopœia or National Formulary shall be deemed to be adulterated under this provision if the standard of strength, quality, or purity be plainly stated upon the bottle, box or other container thereof, although the standard may differ from that determined by the test laid down in the United States Pharmacopœia or National Formulary."

The meaning of the foregoing somewhat involved phraseology is, in brief, that when a title found in the United States Pharmacopœia or National Formulary is used without qualification or explanation, the article sold thereunder must be of strictly U. S. P. or N. F. quality, but that such a title may be used (under the proviso) upon an article of a different standard if the label plainly indicates the standard to which it conforms.

Identical or very similar provisions are found in many of the state food and drug acts, so that arguments for or against the existence of the variation clause of the Federal law will have equal application to state laws.

In view of the fact that the repeal of the variation clause has been demanded upon the ground that it permits the sale of inferior and adulterated products under official titles, it may be profitable to consider some of the reasons which

---

\* Read before the Division of Pharmaceutical Chemistry of the American Chemical Society, New Orleans, April 2, 1915.

lead to its inclusion in the law, and also some of the reasons why its repeal would work unnecessary hardship to the chemical arts and industries and be inimical to the legitimate interests of pharmacy and medicine.

(1) *The Pharmacopœia is a book of limited standards properly applicable to drugs and chemical products only when used in pharmacy and medicine.*

The purpose of the food and drug laws is to prevent fraud and deception in the sale of drugs and medicinal products, not to limit the proper activities of manufacturing pharmacists or chemists or to restrict the trade in chemical or medicinal products within narrow, specified channels.

The Pharmacopœia appropriates titles previously devised and generally used in the arts and industries and attaches to them special meanings and limitations which, though sufficient for pharmacopœial processes and purposes, are not practicable when applied to substances used in the chemical arts and industries in which by far the large proportion of such substances are consumed.

The Revision Committee of the Pharmacopœia in standardizing these substances standardizes them solely for medicinal purposes or for use in the official formulæ and processes. Many of them have other and important uses outside of pharmacy and medicine, and it would be monstrous if the Pharmacopœia by the adoption of well known and commonly used titles could thereafter prevent their use in connection with products to which they had always been attached unless such products were modified to fit the pharmacopœial standards.

The framers of the official standards have themselves recognized the unfitness of these standards for commercial and technical purposes by the specific declaration in the preface to the Pharmacopœia that, "The standards of purity and strength prescribed in the text of the Pharmacopœia are intended to apply to substances which are used solely for medicinal purposes, and when professedly bought, sold, or dispensed as such."

The openly alleged purpose in making the variation clause a part of the Food and Drugs Act was to give legal force and effect to this declaration from the preface to the Pharmacopœia. Consequently, the repeal of the variation clause at this time could hardly be interpreted in any other light than as showing the intention of Congress to reverse its former action, and to make of universal application the words of the statute that an article shall be deemed to be adulterated if, "when sold under or by a name recognized in the United States Pharmacopœia or National Formulary, it differs from the standard of strength, quality or purity, as laid down in the United States Pharmacopœia or National Formulary official at the time of investigation."

(2) *The variation clause is essential to the utilization of certain natural products in a perfectly proper and legitimate manner.*

Certain alkaloid-bearing drugs are properly required by the United States Pharmacopœia to contain specified percentages of their respective alkaloids when dispensed as medicines or when used in the preparation of official tinctures and fluidextracts. Nature, however, does not always supply drugs which contain exactly the specified content of alkaloid. Sometimes the percentage is below and sometimes above the official specifications, and a drug which is too strong is just as much illegal as one which is too weak.

While such drugs are unfitted for medicinal use in their natural condition,

they can be brought to the proper strength by grinding and mixing those which are above with those which are below the official requirements, or they can be utilized for the manufacture of the free alkaloids. These are perfectly proper and legitimate uses of such drugs, but in the absence of a variation clause in the Food and Drugs Act they could not lawfully be imported or transported in interstate commerce for these purposes.

(3) *The restriction of medicaments to one particular standard which could not be varied from under any circumstances, would be an unwarranted interference with the freedom of choice of medical practitioners who might prefer a different standard.*

Physicians and schools of medicine are by no means in accord as to the best forms of particular medicaments, and forms which are preferred by certain schools are condemned by others. The only proper condition of the law is one which will permit each physician to purchase or to prescribe that which in his judgment is the best.

For example, the Spirit of Nitrous Ether was formerly prepared by the action of nitric acid on ethyl alcohol in the presence of metallic copper, whereas the present official process requires it to be made by reaction between ethyl alcohol, sodium nitrite and sulphuric acid. Rightly or wrongly, many physicians insist that the old process yielded a spirit containing different by-products and therapeutically much superior to that produced by the present method of manufacture, and such physicians will not knowingly use a preparation made by the formula now official.

There can be no good reason why those who prefer the older product should not be permitted to have it, nor can there be any good reason why it should not be dealt in under a label which shows plainly that it was prepared according to the method formerly official.

Numerous other instances might be cited, where special forms of preparations preferred by particular physicians or particular schools could not be lawfully dealt in under their proper titles were it not that the variation clause makes them legal when they are appropriately labeled to show their variation from the present pharmacopœial standard.

(4) *The insistence upon an invariable standard which under no circumstances could be departed from requires the unwarranted assumption that the present official standards are perfect standards, and would operate to delay the introduction and use of improved and superior therapeutic products.*

A new revision of the Pharmacopœia is issued approximately every ten years, and each revision shows many changes from the standards formerly official. Many, or perhaps most of these changes are proved to be necessary by experiments made and published long before the new volume appears, or even before the Revision Committee has been selected. By virtue of the variation clause the superior products resulting from the adoption of these changes are immediately available in commerce by the simple expedient of labeling them so as to show that they conform to a different standard.

Examples of improvement produced by changes in official formulas are found in the newer liquid preparations of the so-called heart-tonic series of drugs of which digitalis is typical. When the eighth decennial revision of the Phar-

macopœia appeared in 1905, no acceptable method of standardizing the preparations of these drugs had been worked out. Since that date, however, several fairly reliable methods of physiological standardization have been developed, by means of which it has been fully determined that the use of a stronger alcoholic menstruum will yield a product which is not only initially more active, but one which will deteriorate much less rapidly than one made with the official menstruum. The fortunate inclusion of the variation clause in the food and drug laws permitted these greatly superior products to become immediately available, whereas without this saving clause they could not have been marketed, except under new and unfamiliar titles, until after the publication of the ninth revision of the Pharmacopœia, which will probably appear some time during the present year.

A large list of other preparations might be named in which modifications of official formulas yield improved products, the superiority of which is attested by the fact that the modifications are later approved and adopted by the Revision Committee. In the majority of instances the new preparations involve the employment of more costly materials or of more expensive processes of manufacture, so that the changes are not suggested by a desire to debase or cheapen the products, but solely by the desire to provide the medical profession with more efficient therapeutic agents.

(5) *The repeal of the variation clause would make it impossible for the owner of a stock of drugs and chemicals to dispose of them in a lawful manner when the standards of the Pharmacopœia are altered.*

Sometime during the present year a new Pharmacopœia will become official, and will show some hundreds of changes from the standards now in force, which means that some hundreds of items of an ordinary drug stock will suddenly become illegal if offered for sale under their titles as these will appear in the new book. These articles were in full compliance with the legal standards when made or purchased, and without any act or fault of their owners have been converted into adulterated products by the change in standards.

A legitimate demand for the articles conforming to the former standard will still exist, but only by virtue of the continuance of the variation clause in the law will it be possible to dispense them under proper labels showing the standard to which they conform.

(6) *The abuses claimed to be due to the existence of the variation clause can be largely, if not entirely cured by a proper interpretation of the variation clause.*

The principal offense charged against the variation clause is that it permits the marketing of so-called grocers' drugs, as ammonia water, hydrogen peroxide solution, spirit of camphor, etc., of inferior quality by the device of stating their percentage strength upon the label, and that the purchaser is deceived for lack of knowledge as to what a proper preparation should be.

The fault here, however, is in permitting the use of a label which does not fully comply with the requirement that the "standard of strength, quality, or purity" shall be "*plainly stated*" on the label.

The clear intentment of the law is that a drug of other than U. S. P. or N. F. quality shall show upon its label the information necessary to enable a purchaser to form an intelligent judgment of its quality or purity, either by direct

reference to another standard or by statements which of themselves sufficiently indicate its quality and purity.

What such statements would need to be must, of course, vary with the nature of the product and with the character of the persons to whom addressed. When placed upon products intended for use by trained chemists and pharmacists, statements indicating percentages of important constituents, or the activity of the preparation for certain purposes, would be sufficient to convey all the needed information, while in the case of articles intended for popular purchase and consumption some additional or different statements might properly be regarded as necessary.

This is an interpretation that I think the courts would recognize as being in accord with the spirit of the enactment, and one that if enforced will effectually protect the innocent purchaser against intentional fraud and deception.

---

### STATE ANTI-NARCOTIC LAWS.

---

M. J. WILBERT.

---

The enactment of the Federal anti-narcotic law, December 17, 1914, has suggested to many the desirability of bringing about greater uniformity in state anti-narcotic laws and in a number of states bills have been introduced that are designed to bring the requirements of the state law into accord with the present Federal law.

While greater uniformity in laws designed to restrict the sale and use of narcotic drugs is no doubt desirable, there are several points that may well be considered by pharmacists before they undertake to endorse any one of the proposed uniform state anti-narcotic laws modeled after the Federal law of December 17, 1914.

Not the least important of these several points is the fact that the Federal anti-narcotic law, quite unlike the Federal food and drugs act, is applicable and is now uniformly in force in all parts of the United States and is by no means restricted, as is the food and drugs law, to Federal territories and to interstate traffic.

With this fact in mind it would be manifestly unnecessary to re-enact in the several states any part or all of the Federal anti-narcotic law. Such enactment would only tend to duplicate the penalties that might be imposed on a person for not complying with the law, as conviction under one law would make the same person guilty or amenable under the other.

An article published in Public Health Reports for March 26, 1915 (page 893-923), presents a comparative analysis of the more important requirements embodied in the existing Federal and state laws that are designed to restrict or to regulate the distribution and use of opium, coca and other narcotic or habit-forming drugs. This analysis shows that even at the present time a number of the state laws include requirements similar to those embodied in the Federal law and to this extent duplicate that law and subject the individual found guilty of non-compliance to double punishment. On the other hand the existing state laws,

in some instances at least, are more comprehensive than is the Federal law, and for this reason it would be unfortunate indeed to repeal all of the existing laws or to restrict in any way the possible influence for good that may be embodied therein.

Future state legislation should be primarily designed to elaborate or to augment the present Federal law by reasonable exercise of the state police powers. To do this it will be above all necessary to restrict the prerogatives or privileges of persons who may be licensed under the Federal act as pharmacists, physicians, dentists, veterinary surgeons or chemists and to define in clear language the rights and limitations of hospitals and sanitariums to use or distribute the proscribed drugs. The state should also restrict the distribution, sale and use of dangerous drugs not already included in the Federal law. The desirability of the latter feature is evidenced even at the present time by the fact that no fewer than eighteen states restrict the sale and use of chloral and its derivatives, while four restrict the sale and use of cannabis indica, both drugs that may be used to produce deleterious habituation or intoxication.

The legitimate objects of a state anti-narcotic law, from this point of view would be:

A further restriction of the articles that may be sold without providing a satisfactory record;

Some reasonable form of definition as to the rights and privileges of practitioners of pharmacy, medicine, dentistry, and veterinary medicine;

A requirement for the prompt reporting of habitual users of any of the enumerated drugs;

Reasonable provisions for the committing of habitual users of habit-forming drugs to public institutions, where they will be properly taken care of;

Provisions for the revocation of licenses to practice pharmacy, medicine, dentistry, or veterinary medicine that may be held by habitual users of habit-forming drugs;

Provisions for the revocation of the license to practice any one of the above-named professions, after conviction under the Federal or state laws designed to restrict the sale and use of narcotic drugs; and finally

Satisfactory provisions for enforcing the several requirements embodied in the law.

A law of this type would of necessity be primarily designed to safeguard public health and its enforcement should therefore preferably be entrusted to the State Department of Health, providing an appropriation is made to secure a sufficient number of inspectors or agents necessary to enforce the provisions of the act.

The penalties imposed should be sufficiently severe to make violation of the law a matter of serious consequence and should for the second offense, at least, include the possibility of imprisonment in the discretion of the court.

Efforts to restrict the use or abuse of drugs that constitute a menace to the future welfare of our American people are generally admitted to be among the more serious problems confronting the citizens of this country at the present time. As pharmacists, we should not forget that we are by law entrusted with the distribution of these drugs and it is incumbent on us to make all reasonable efforts to safeguard their sale and eliminate as much as possible all illicit traffic in drugs

of this type. We pharmacists should not forget that unless we collectively and individually make strenuous efforts to convict the guilty, we as members of the drug trade, must suffer by being held in part responsible for the harm that may be done to the community at large.

---

## UNIFORM STATE NARCOTIC LEGISLATION.\*

---

CHARLES WESLEY DUNN.

---

In considering the form of a uniform state narcotic law the first problem for solution is the extent of its scope. It is fundamental that the obligation imposed upon the persons affected by this law should not be duplicated in the state law to the extent that two sets of records or two different acts will be required to satisfy a similar requirement, Federal and state. In view of the fact that the Federal law relates to all commerce, both interstate and intrastate, should the states leave the entire field of the regulation of commerce to the Federal law and only include additional and supplemental provisions of a police character? We believe that this question must be answered in the negative for the following reasons, viz.: First, and principally, and as the practical reason, the states will not be denied a very important exercise of their police power. They will not be content to leave the regulation of the commerce in narcotic drugs solely to the Federal Government. We believe that any propaganda along this line would be resented and futile, and therefore, not wise. Second, this duplication of law and enforcement is inevitable under our own system of national, state and municipal regulation, and is general at the present time. Uniformity and harmony of such regulation is the object to be sought, in order that no conflict in such regulation may exist and no unnecessary or undue provisions may be included. Third, and providing always that the Federal and local regulation is uniform and harmonious, the additional state regulation insures greater efficiency and breadth of enforcement. Duplication of penalty under similar Federal and state laws is not a substantial basis for criticism. For, after all, a uniform and effective law necessary in the public interest and fair and just in application is a proper subject for state enactment. Fourth, and finally, it should be considered that, while the state cannot, constitutionally, void the operation of the Federal law by conflicting provisions, yet it may supplement the Federal law and occupy a ground beyond that circumscribed by Congress in the Federal law. These supplemental provisions will not only relate to matters not included in the Federal law, of a police character, such as the treatment of habitual users, but will, also, supplement to a greater or less degree, the Federal provisions regulating the commerce in these drugs. The history of the existing and proposed narcotic legislation to date substantiates the soundness of these reasons.

It is our opinion, therefore, that a uniform state narcotic law should be com-

---

\* Read before the Society of Medical Jurisprudence, New York City, May 10.

plete in itself and its scope should only be limited by the extent of the provisions deemed necessary and advisable to be included therein.

We now have to indicate several fundamental considerations which should, we believe, be held in mind in the drafting of a uniform state narcotic law:

(a) A uniform state narcotic law, as the name implies, should be in entire harmony with the Federal narcotic law. The record and official order form requirements, etc., of the Federal law, so far as they go, should be accepted as satisfactory under the state law. It is perfectly obvious that it is placing a needless and unwarranted burden upon the medical and pharmaceutical professions to require two different official order forms and two different and distinctive sets of records, Federal and state.

(b) A uniform state narcotic law should contain no state compulsory registration and taxation provisions for the reason that such provisions would be needless and unwarranted. The revenue form of the Federal narcotic law was only adopted by Congress in order to permit, constitutionally, the reaching of all commerce, impossible under an interstate commerce act. No such reason exists in the states. The registration information under the Federal law is open to the state officials. Such special taxation laws relating to foods and drugs enacted by the states are not, we believe, and generally speaking, equitable. The general funds of the several states should be used for the administration of these laws. We do not believe it advisable to provide in a uniform state narcotic law that only those persons who have registered under the Federal law may deal in and prescribe these drugs under the state law, because of possible constitutional questions which might thereby be raised, and for a very sufficient reason that such a limitation is entirely unnecessary. Every person who is legitimately dealing in or prescribing these drugs must register under the Federal law and no one else may so register.

(c) A uniform state narcotic law should follow the wording of the Federal narcotic law, so far as possible, in the interest of identity, clarity and simplicity. The development should always be toward the amendment of the Federal law, where such an amendment is advisable, as the law of the land, rather than toward building up state legislation without further reference to the Federal law. This is the general principle we believe should be followed so far as possible. Doubtless there will be sufficient reasons for instituting certain requirements first through the medium of state legislation. Certain other provisions of a police or local character will always be the special and exclusive province of the states.

(d) A uniform state narcotic law should include supplemental police provisions in the public interest. The following provisions might well be considered:

1. The regulation of the treatment of the habitual users of these drugs, including a provision for committal to some suitable institution, where such committal is in the public interest. The legitimate medical treatment of narcotic habits should be affirmatively recognized and approved. It does not appear to be in the public interest or in the interest of humanity to search down these unfortunate individuals as criminals and a public menace and to arbitrarily confine them in institutions, and to arbitrarily cut off their supply of narcotics. Is not this rather

a medical question, to the larger degree, which must be so determined? We believe that it would be a fair and effective requirement to provide for a clinical record of the disposition of narcotic drugs to an habitual user, which record shall be open to the inspection of the State Board of Health. That the disposition of these drugs to habitual users for any other than a medicinal purpose should be prohibited. That due provision should be made for the medical treatment of such persons and for commitment to some suitable institution, public or private, where such commitment is deemed advisable in view of all the circumstances. The commitment provisions should be carefully circumscribed to provide against their abuse.

2. Provision should be made for the liability to the revocation or suspension of his license by a licensed physician, dentist, veterinary surgeon, nurse, or registered pharmacist, who is addicted to the use of these narcotic drugs in a manner contrary to the public welfare or who has been convicted of such a violation of this law that such revocation or suspension would be in the public interest. In keeping with the seriousness of such a revocation or suspension due provision should be made to properly protect the legitimate rights of the person charged, by providing for a fair hearing on a reasonable notice and, further, by providing for an appeal to a court of competent jurisdiction for a review of the sufficiency of the evidence on which the revocation or suspension was based.

3. Provision should be made to prohibit the false and fraudulent issuing or altering of a prescription or order for the purpose of avoiding the provisions of this law and to prohibit the false and fraudulent assumption of the title or name, in any manner, of a physician, dentist, veterinary surgeon or registered pharmacist, or the posing as a legitimate dealer in order to avoid the provisions of this law.

Other similar police provisions will, no doubt, be found advisable. We have only the time now to briefly indicate a few suggestions. We do not refer to the provisions included in the Federal law and regulations against the refilling of prescriptions, etc., which should be included, as a matter of course, in a uniform State narcotic law.

We believe that a uniform State narcotic law should exempt, as should, also, the Federal law, derivatives, preparations and manufactures of the affected narcotic drugs which do not possess narcotic or habit-forming qualities.

It would not appear to be necessary to include a special provision regulating the commerce in hypodermic needles and syringes, for the reasons that an effective regulation of the commerce in the narcotic drugs of themselves would include the legitimate use of the instruments by which they are administered. This expression of opinion is subject to correction if such regulation would not be sufficient.

Provisions relating to opium for smoking purposes and to the smuggling of these drugs into public institutions should be the subject of special and separate legislation.

The Federal narcotic law relates to opium and coca leaves, their manufactures, salts, derivatives and preparations. Several of the State laws relate, in addition, to chloral hydrate, *cannabis indica*, *cannabis sativa*, etc. It is certain

that no State should be asked or would be expected to eliminate these drugs from the existing laws, if their regulation is in the public interest. If there is a general need for such regulation the Federal law should be so amended. If there is a local need the local law should be maintained. Again, in several states, there are exceedingly strong special laws, such as cocaine laws. The advisability of disturbing these laws where no question of uniformity is involved would be questionable. Here, again, local conditions are a factor for consideration.

These and other problems will have to be met in the preparation of a uniform State narcotic law, which law will, no doubt, have to be remolded to a greater or less extent in respect to matters purely local and where no question of uniformity is involved. The purpose of such a uniform State law would be to provide certain uniform fundamental provisions, to raise the local law in each locality to the highest degree of efficiency, to eliminate unnecessary or unwarranted provisions, and, then, to leave to the individual states the solution of purely local questions.

That there is a need for a uniform state law will be apparent from an examination of the existing State narcotic laws, with their diversity and conflict of provisions. The problems underlying State narcotic legislation involving social, economic, medical, penal and general public welfare considerations, are so important and their proper solution so entirely in the public interest, that such an intelligent and co-operative study thereof and final expression in a uniform law cannot but prove distinctly valuable. State narcotic legislation will now be an important and active subject for consideration by the legislatures of the several states. Many well intentioned but ill-advised suggestions will be made. The value of general uniformity will perhaps be lost sight of. It behooves, therefore, the medical and pharmaceutical professions to give careful and thoughtful attention to the subject of uniform State narcotic legislation. A uniform law has already been suggested by the Chamber of Commerce of the United States of America, through its committee on uniform food and drug regulation, and by the National Association of Retail Druggists. The enlightened and public spirited co-operation of the medical and pharmaceutical professions in such beneficent matters reflects its greatest credit upon them. The Society of Medical Jurisprudence is peculiarly positioned and equipped to seriously and actively study this important problem to the end that an effective uniform state narcotic law may be enacted which will best serve the interests of the public, and the legitimate interests of the pharmaceutical and medical professions.

A special committee on narcotic legislation has been appointed by the president of the Society of Medical Jurisprudence, consisting of Charles Wesley Dunn and Doctors Reynold Webb Wilcox and Frank H. Daniels.

## GREASY COLD CREAMS.

ERNEST R. JONES, PH. C.

I doubt if there is a more popular toilet preparation than a fatty or greasy cold cream. Most every retail druggist has such a preparation under his own label. Many prefer to have these creams prepared for them by some manufacturing house, but there still remains a lot of druggists who will always prepare their own according to some "pet" formula they may possess.

The term "Cold Cream" probably originated from the fact that the evaporation of the moisture from them when applied to the skin gave a cooling effect.

The writer has recently conducted some exhaustive experiments with greasy cold creams and believes that some of his findings will be of great interest to the manufacturing pharmacist.

The pharmaceutical literature is filled with formulas for these creams, some of which differ considerably, and a great many of which give poor products. Let me state at the beginning of this paper that I am not going to give any formulas for making these creams, but will merely give you the results of my experiments and such suggestions as may help you in locating your source of trouble or in improving your formula.

At least four things are necessary to make a good cold cream, namely: 1st, white beeswax; 2nd, an oil; 3rd, a saponifying agent, and 4th, water.

Before taking up these different classes of ingredients, let us consider first

## THE CHEMISTRY OF GREASY COLD CREAMS.

These creams are essentially emulsions. What, then, is the emulsifying agent?

We all know that soap has great emulsifying properties. If a soap is formed with the beeswax, and this soap acts as the emulsifying agent, then if the beeswax were omitted and castile soap, or any other soap, used instead, with enough ceresin to harden it, the resulting product should be a cold cream or emulsion. I have made such a cream, and while it is not a salable article, the fact that it was possible to make a cream in such a manner is good proof of the formation of a soap when beeswax is used.

If we mix the proper quantities of stearic acid, alkali, liquid petrolatum, water and an unsaponifiable hardening agent, such as paraffin or ceresin, an emulsion is readily formed. Here the alkali forms a soap with the stearic acid, and this acts as an emulsifying agent.

If beeswax is substituted for the stearic acid, we get the same results. Accordingly, we would conclude that there is present in the beeswax some constituent which will readily form a soap with as weak an alkali as borax.

According to Lewkowitsch<sup>1</sup> beeswax consists chiefly of a mixture of crude cerotic acid and myricin (melissyl myricyl palmitate). It also contains small quantities of free melissic acid and three or four other unimportant ingredients. The amount of this latter acid present is so small that we do not need to consider it.

<sup>1</sup> Lewkowitsch, 5th Edit. Vol. 2, P. 900

According to Lewkowitsch,<sup>2</sup> free cerotic acid is present to the extent of 12 to 16 per cent, depending upon the source of the wax.

We know that solutions of borax, owing to the hydrolysis that takes place, react quite alkaline; that is to say, its solutions will contain a small amount of sodium hydroxide. When these aqueous alkaline solutions are brought in contact with the melted beeswax, all or a portion of the free cerotic acid is saponified. This soap then acts as an emulsifying agent for the balance of the wax and the other ingredients.

This equation may be represented thus:

The other ingredient of beeswax, myricyl palmitate, ( $\text{C}_{30}\text{H}_{61}\text{O.CO.C}_{15}\text{H}_{31}$ ) probably is not saponified to any appreciable extent and more likely not at all by the alkaline borax solution, for such esters are very hard to saponify even with stronger alkalies and require considerable time to effect the change. In making cold creams the alkalinity of the borax solution is immediately neutralized by the cerotic acid, and it is therefore improbable that the myricyl palmitate enters at all into the chemistry of cold creams.

I desire to take exceptions to an article on "The Chemistry of Cold Creams," by Groat,<sup>3</sup> who claims that borax reacts with the myricyl palmitate and with the glycerides of other oils and fats to saponify them. The preceding paragraph will show my reasons for differing with him in this respect.

To continue, in the same article Groat gives an equation showing the reaction of the borax and water upon the myricyl palmitate in which he claims palmitic borate is formed. As he does not mention anything at all about the soap that is formed (sodium cerotate) one would conclude that this was his idea of the reactions entering into the manufacture of cold creams. He could not have tried to prove his statements by experiments, for he goes on to say, "We shall now take up the reaction of borax with spermaceti. The chief constituent of spermaceti is cetinocetyl palmitate, which is attacked by the borax forming palmitic borate, as in the case of white wax, etc." Here again his idea is the formation of an ester (palmitic borate) by the borax. Let me say right here, that you cannot make a cold cream from spermaceti unless you introduce soap by some other means, for spermaceti does not contain more than traces of free acid and therefore could not form a soap of itself. Palmitic borate does not exist to any extent, if at all in cold cream, and Groat's statements are in my opinion, erroneous. To sum it up, I would say that he has overlooked the presence of free acids in the wax which form soaps with the alkaline borax solutions and instead has given the impression that organic esters were formed. Supposing one should use sodium carbonate or sodium citrate instead of borax. These both form cold creams with wax. Then according to his theories the resulting cream would consist of palmitic carbonate or palmitic citrate. Perhaps he did not know that a cream could be made from these above named substances. I have prepared such creams.

<sup>2</sup> Lewkowitsch, 5th Edit. Vol. 2, P. 905.

<sup>3</sup> Journal of the A. Ph. Assoc., Feb., 1915, P. 169.

Both the carbonate and the citrate give aqueous solutions which are alkaline. According to the Hydrolytic Dissociation Theory we would not expect sodium citrate to give as strongly alkaline solution as the carbonate and could not therefore expect as much soap to be formed or as good a cream as when the borate or carbonate are used. We find such to be the case, but there is enough soap formed to prove that the emulsification of the cold cream is brought about by the soap rather than by the formation of any esters.

Only such fats and waxes as contain free acids can be used to form soaps with the borax solution. Those fats and waxes which are free from acid are only valuable as stiffening agents. You will then see that beeswax or some other such product which has an acid value is absolutely necessary in order to make a cold cream.

The acid value indicates the number of milligrams of potassium hydrate required to saturate the free fatty acids in one gram of a fat or wax, and is therefore a measure of the free fatty acids in a fat or wax.

It is evident that if an oil or fat consists exclusively of neutral triglycerides, its acid value will be nil. We would not expect such a fat or wax to yield a soap or to act as an emulsifier for the balance of ingredients.

Lewkowitch gives the following acid value for the several fats or waxes:

	Acid Value
Carnauba Wax .....	2
Japan Wax .....	20
Spermaceti .....	traces
Beeswax .....	20
Tallow .....	4
Paraffin .....	0
Ceresin .....	0

According to my theories then, one could not make a soap from paraffin or ceresin and a solution of borax or any other alkaline solution. Consequently a cold cream could not be made from these substances unless wax or some other substance containing free fatty acid is added. From the above table we would not expect spermaceti to act any better for it is, according to the above, a practically neutral substance. Tallow and Carnauba wax will however make an emulsion, but as the quantity of soap formed is very small the cream is not smooth, or in other words, the emulsion is not very good. Japan wax and beeswax we would expect to yield good creams. Experiments made in the laboratory prove this to be so, although I do not recommend Japan wax to you for use in your creams, because it has a lower melting point and more color and odor than beeswax. These statements are offered as further proof that a soap is formed in making cold cream and to show that only those substances containing free acid will make an emulsion when the borax solution is added.

Let us now pass on to the first class of ingredients necessary to make cold cream, namely:

#### HARDENING OR STIFFENING AGENTS.

Beeswax as you all probably know is secreted by the common bee, *Apis mellifica*. Honey is removed from the combs by centrifugal force. The wax is then obtained by melting and straining or by expression. The expressed wax is as a rule of a yellowish color and has to be purified, followed, if required, by a

process of bleaching, either by air and light or by chemical agents which will yield nascent oxygen.

The best bleached white wax is of a pure white or only slightly yellowish color. The whiter the wax you use in your cream, the whiter the cream will be.

It can be definitely stated that white beeswax is absolutely necessary to every first class white cold cream. It supplies the soap necessary to form the emulsion and gives the smoothest cream of any of the waxes. It should be present in sufficient quantity to give the cream the desired stiffness. However, white wax is quite an expensive substance and a part of it can be replaced by other substances such as spermaceti, paraffin or white ceresin. In making such substitutes one must bear in mind that a certain amount of white wax is necessary to make the emulsion and when too much of the white wax is replaced the creams are not smooth and in some cases there is a tendency towards separation of the emulsion. I would advise you not to try to take out too much of the white wax.

Spermaceti, then, is only valuable as a stiffening agent, because it does not form any soap. It is also quite expensive and has a low melting point ( $45^{\circ}$ - $50^{\circ}$  C.) More of it is therefore required to accomplish the purpose than is required of either paraffin or ceresin, consequently it is an expensive and unnecessary ingredient. Six samples of cream were made containing varying amounts of spermaceti. The ones containing the least of it were easily selected as being the smoothest, but none of them were as smooth as when the spermaceti was omitted entirely. I would therefore advise that spermaceti be omitted from your formula and that paraffin or white ceresin be used instead.

Paraffin is useful as a stiffening agent. Too much of it cannot be used as it will interfere with the smoothness of the cream.

White ceresin is an excellent stiffening agent when used in conjunction with white wax. Ceresin (osokerite) is a natural earth-wax or hydrocarbon. When purified and bleached it is a snow-white solid resembling paraffin in its properties. It has considerably higher melting point (about  $62^{\circ}$  C.) than paraffin, consequently less of it is required to produce the same amount of stiffening. It is a little more expensive than paraffin but much less so than spermaceti. Like paraffin, it cannot be used in too great a quantity.

Stearic acid is sometimes used as a stiffening agent, in small amounts. It permits of the incorporation of more water and thus gives a whiter and less greasy cream. It has the disadvantage of making the cream granular in time, even if very small amounts are used. If the smoothness of your cream is a desirable asset, don't use stearic acid.

When creams are to be sold in warm climates more stiffening agent is required.

#### THE OILS.

Two classes of oils are sometimes used: the vegetable and mineral.

The vegetable oils are said to be absorbed better by the skin than the petroleum oils, and therefore are preferred in medicinal creams. Expressed oil of almonds, peach kernel, castor, olive, cocoanut, cottonseed and sesame oils are frequently used. The objection to them is that when emulsified, they quickly become rancid. Also they impart an odor which is objectionable and do not yield the whitest of creams.

Lanoline is sometimes used, but its odor and color are objectionable. If a white cream is desired, it cannot be used at all. It has the advantage of being easily absorbed by the skin.

This brings us to the mineral or petroleum oils. These oils can be secured in a variety of grades differing in color, odor and specific gravity, according to the price you wish to pay. It is not necessary to buy the Russian mineral oils for creams. American oils are cheaper and good enough grades are obtainable. To make the best cream, the oil should be colorless and with as little odor as possible. The specific gravity may range from .860 to .880. One gives as good a cream as the other, but the one of the higher specific gravity requires less stiffening agent.

A snow-white mineral jelly or petrolatum may be used in creams for warm climates. If used in other climates less stiffening agent should be used. One does not need to pay the price asked for these jellies for they are not natural jellies but are made by solidifying the mineral oil with white ceresin. All you would have to do to obtain this same effect would be to increase the amount of white ceresin in your formula.

The claim has been made that mineral oils induce the growth of hair. The writer believes that this is without foundation and the public have a wrong idea of the matter, which is traceable to unscrupulous advertisements. If there is any growth of hair, it more likely comes from stimulation of the hair cells through massage.

Cold creams made with mineral oil are permanent and do not turn rancid.

#### THE SAPONIFYING AGENT.

Borax is the best for this purpose. This salt is a combination of a strong base and a weak acid. When dissolved in water, it undergoes hydrolysis, yielding solutions which are distinctly alkaline to litmus. This alkalinity is neutralized by the cerotic acid of the wax forming the soap which in turn acts as an emulsifying agent for the balance of the ingredients.

Creams can be made with any other substances whose solutions react alkaline. Those made with potassium salts are softer than those made with sodium salts.

Borax gives the best and smoothest cream and is to be preferred over all others. The fourth essential ingredient is

#### WATER.

Distilled water is always to be preferred, although tap water can be used if it does not contain much calcium or iron. The proper amount to use is an important matter. No matter what the ingredients you select or how good the quality, unless you use them in the proper proportions, that is, have your formula properly balanced, your cream will not be the best possible to obtain.

I have analyzed several cold creams on the market and found them to contain from 22 to 40% of water. The one containing 40% was the whitest but the least smooth of any and contained some stearate; otherwise this high percentage would not have been possible.

It might be said here, that the water is what makes the cold cream white. The more water, the whiter the cream of course, but too much water makes the cream granular and may cause a separation.

My experiments have shown 25% of water to be the proper amount to use from a manufacturer's view point. I have observed such samples during two years and find them to keep perfectly without separation or granulation.

#### THE PERFUME.

The perfume is added just before the cream is drawn off into the containers, otherwise a portion of it is volatilized by the heat. The perfume should not contain much alcohol as the alcohol has a tendency to break up the emulsion, especially when hot.

Rose, Lilac and Violet are the most popular odors, the rose predominating. Rose and Violet are quite expensive. Lilac is one of the cheapest.

Let me caution you about lilac perfumes for creams. Most of them excepting perhaps a few expensive ones, contain quite a bit of terpineol. Some of you may be using terpineol itself as a perfume. This substance is very irritating to the skin and should not be used in cold creams. Synthetic perfumes are more often irritating than natural oils. If you have complaints that your cream irritates the skin, the first place to look for the trouble is in your perfume.

One other thing about perfumes. They often cause discoloration of the cream, sometimes even making the cream decidedly brown.

The discoloration by the perfume must be distinguished from the loss of whiteness that comes from the cream drying out. To test this, make up two samples of cream from the same formula. Perfume only one of them. Preserve them under the same conditions in the same kind of containers. After standing awhile they can be compared. If the perfume sample is noticeably more discolored than the other, the trouble can be attributed to the perfume.

#### THE CONTAINER.

Collapsible tubes are by far the ideal, as the cream does not dry out and they are more sanitary.

Collapsible tubes are not as attractive to the trade as jars and are not as convenient for the druggists to fill.

Jars with screw tops are therefore the most popular. You cannot be too careful in selecting your jars. I refer particularly to choosing a jar which has a tight-fitting cover. The covers should require at least a full turn to tighten them and extra precautions such as a paraffined card-board washer should be used. In fact, you should aim at having your jar as nearly hermetically sealed as possible. The reason for this is very simple, yet it is the cause of many a druggist's or manufacturer's difficulties. Cold cream contains water, which cannot help but dry out if improperly protected. As the cream loses water, it loses its whiteness and takes on a lardy appearance. It shrinks in the jar and pulls away from the sides. The result is soon only a partly filled jar.

The cream should be poured into the jars while still liquid and at as low a temperature as possible to prevent too large a hollow being formed in the center. A better surface can be obtained by warming the jars before filling them with cream. This permits of a more even cooling of the cream, whereas when poured into a cold jar the cream cools around the sides and bottom first. As it cools it contracts and forms the hollow in the center and may cause a pulling away of the cream from the sides of the jar.

## PINK CREAMS.

Colored creams are novelties. A pink cream with a carnation perfume is quite popular just now.

These are made by dissolving a small amount of an oil-soluble color in the melted fats before adding the borax solution. The latter is not to be colored.

To make a pink cream, use the dye known as Oil Red S.

## THEATRICAL COLD CREAMS.

These are cheaper creams and are usually sold in large packages. They may be softer than an ordinary cream. A cheap grade of mineral oil can be used. They are not intended for toilet purposes but for "make-up" use and therefore do not need to be of as good a quality.

## TROUBLES YOU MAY ENCOUNTER.

Cream is not smooth. This may be due to a poor formula or to improper care in mixing.

Lack of whiteness. The wax may not have been very white or the cream may have lost some of its water.

Separation of water indicates either carelessness in mixing or more likely a faulty formula. Perhaps your formula contains too high a percentage of water.

Cream appears lardy after standing some time. Indicates loss of water. Covers do not fit tight enough.

Shrinking in the jars indicates loss of water.

Pulling away from sides of jars. If this takes place within a few days it may be due to improperly balanced formula or to pouring the cream too hot or to using too cold jars. If it does not take place for several weeks, it is probably due to loss of water.

Discoloration. This is almost always due to the perfume. The use of iron utensils may also cause discoloration.

Cream separates. May be due to the jars standing in the sun or in too warm a place.

## CONCLUSIONS.

1. Greasy cold creams are essentially emulsions, brought about by the formation of a soap by the alkaline borax solution and the free cerotic acid of the wax, the soap acting as an emulsifying agent.

2. White bees-wax, paraffin or ceresin, colorless liquid petrolatum (mineral oil), borax and water in proper proportions form the best creams.

3. Creams made from the above ingredients are more permanent than when vegetable oils are used and do not turn rancid.

4. Much attention should be paid to obtaining tight-fitting covers for the jars to guard against loss of water.

ANALYTICAL AND EXPERIMENTAL DEPARTMENT, PARKE, DAVIS & Co., Detroit, Michigan.

## REMARKS ON DIGITALIS.\*

---

WILLIAM C. ALPERS, SC. D.

---

It is generally stated in text-books and also in the United States and other pharmacopœias that the digitalis leaves of the second year's growth are preferable to those of other years, and that the cultivated ones are inferior to the wild ones. Recent observations do not seem to support this statement. F. H. Carr, in the *American Journal of Pharmacy*, states that the first and second year's growths have proved identical in their activity, and the cultivated leaves are at least as active as those wild grown. Hatcher, who in his "Text-book of Materia Medica," by Hatcher and Sollmann, indorses the preference of the second years' growth, has since, in a recent article (*Drug. Cir.*, 1914), claimed equal value for first and second years' leaves, as well as for cultivated leaves in comparison with wild ones. Lloyd's observations also confirm this view, and he attributes the erroneous statement about the second year to the fact that formerly also the root was used, which in the first year is insignificant and sappy, while the second year's root is larger and heavier and more pronounced in quality. There may be another reason, however, for adhering so long to the second year's leaves as better. The statement in the text-books is followed by the other one, "gathered at the commencement of flowering." Now, digitalis does not flower till the second year, and leaves could not be gathered in the first year at the commencement of flowering. As the flowers were also used formerly, and are used today in Japan, it can be understood how the statement of the second year's growth originated, flowers and leaves being gathered at the same time. According to the best investigators, this statement should therefore be changed to "leaves of the first or second year's growth should be used."

Professor Hivohashi, of the University of Tokio, Japan, who made extensive investigations in digitalis, states (*Apoth. Zg.*, 1913, vol. 28, p. 9) that digitalis flowers probably contain more of the active constituents than do the leaves, and the buds are more active than are the expanded flowers.

As to the preservation of the gathered leaves, all kinds of more or less complicated directions are given in the various pharmacopœias. According to recent literature, however, foxglove leaves do not differ materially from most other vegetable drugs; that is, they will deteriorate if kept carelessly, and keep almost indefinitely if properly stored in air-tight containers in dark places. The changes that do undoubtedly happen take place in the time between gathering and marketing, according to the manner in which the drying is done.

There are four pharmaceutical preparations of digitalis official in our pharmacopœia, viz.: The extract, the fluidextract, the tincture, and the infusion, of which the first one is but rarely and the second one not often used. According to all authorities, the tincture and infusion are the two most reliable preparations.

---

\* Abstract of paper read before the Pharmaceutical Section of the Cleveland Academy of Medicine, January 29, 1915, through *American Journal of Pharmacy*.

but there is a vast difference of opinion as to the relative value of the two. Herzfeld states that:

"I believe that in this country the tincture is the least reliable of all preparations of digitalis, particularly since, for the sake of convenience, it is frequently prepared by diluting the fluidextract, which in itself may be inferior."

Other authorities also dwell on the improper preparation of tinctures from fluidextracts. It is well worth while to stop a minute to investigate this charge. I myself have in former years, when physicians made this remark, asked them how many pharmacists, to their positive knowledge, made their tinctures from fluidextracts. Generally the answer was: "Well, of course, I do not know, but conclude, from the fact that sometimes tinctures do not produce the desired effect, that they are made improperly." And when I replied: "Doctor, are you sure that in such cases you always ordered the right medicine?" the answer would be: "Of course I did; I diagnosed the case myself." In other words, whenever the patient does not respond to the treatment the fault lies with the pharmacist, but not with the physician. The unbiased observer will say, if men are apt to make mistakes there will be as many mistakes made by physicians in diagnosing as by pharmacists in dispensing. I personally do not believe that the practice of making tincture from fluidextract is general; it may prevail among lazy and indifferent druggists, who hardly have any prescription trade for this very reason.

Coming back to our subject, there is besides Doctor Herzfeld no other authority to reject the tincture. As a rule, the tincture is preferred to the infusion, so far as reliability is concerned, and whenever the full cardiac effect of digitalis is required. As a diuretic, in cases of faulty circulation of blood through the kidneys, the infusion is preferred by probably 95 percent of all practitioners. An exception is Doctor R. A. Hatcher, who in a recent paper states that:

"As a matter of fact, a properly-made infusion, as well as the tincture, contains all of the therapeutic active principles of digitalis."

He tries to prove this statement by saying that the marc left after making the tincture is inert, and if an infusion be made with this marc and tested on a frog, the truth of this statement becomes apparent. It is to be regretted that he did not also examine the marc left after making the infusion. Later on, in the same article, he says:

"An infusion from a fluidextract might be unsightly, but it would probably be more active than the official infusion which one would obtain from the nearest pharmacy. This practice is distinctly not advocated, but pharmacists should understand the fact."

We ask: Why not advocate it if it makes a better infusion? And if the tincture and infusion are of equal value, why not make the infusion from the tincture, or why not delete one or the other?

In direct contradiction to Hatcher's results we will cite Herzfeld:

"According to the methods of Keller-Fromme, no digitoxin or digitalin could be detected in an infusion prepared according to the U. S. P., while in an infusion, made after my method, as high as 0.02086 percent digitoxin could be found."

Doctor Herzfeld's method is as follows: The leaves are finely broken up and

freed from the stems and ribs. They are then covered with the entire quantity of boiling water and allowed to digest upon the water-bath at 50° C. for one hour. When cooled down to about 32° C. an amount of alcohol corresponding to 10 percent of the finished infusion is added and the whole permitted to stand for twelve hours. The resulting product is then filtered, the leaves expressed, and the necessary amount of water added to restore the volume. Later on he says that this "infusion" (it is rather a weak tincture) should always be prepared fresh. This would compel the patient to wait about fourteen hours for his medicine, a rather long wait for cardiac patients.

In an editorial of the *American Druggist*, 1913, vol. 16, p. 12, the statement is made that:

"According to Henry Beates, not one physician in ten can tell the difference in the effect produced by an infusion of digitalis made from a fluidextract and that produced by one made from the assayed leaf."

This may be interpreted that physicians are not able to tell the effect of their medicine, or that Doctor Hatcher's statement of infusions made from fluidextract is correct.

As to the reliability of the fluidextract itself, we quote J. D. Riedel:

"Fluidextract of digitalis U. S. P. VIII was found to vary in specific gravity from 0.945 to 0.991, and in extract content from 10.30 to 17.41 percent."

And Puckner (*Jour. Amer. Med. Assn.*, 1913) claims:

"Examination of twenty samples of fluidextract of digitalis confirmed the generally-held belief that commercial digitalis preparations vary most widely. The most active were found to be nearly four times as active as the weakest."

Against this statement protests were afterwards printed in a number of pharmaceutical publications.

In the coming pharmacopoeia the formula for the infusion of digitalis will remain the same while the alcohol in the tincture will be increased to 60 percent and the fluidextract to 70 percent. It is claimed that this large amount of alcohol is necessary to preserve the preparation.

I regret that the formula for the infusion will remain unchanged. It is now made with the boiling water and 10 percent of alcohol is added after straining. For what purpose is the alcohol added? The properly prepared infusion without alcohol will keep long enough to be taken, and for a longer preservation the amount of alcohol is inadequate. The alcohol should be omitted and the remark: "To be freshly prepared, when wanted," added to the formula. As it stands now, the presence of alcohol misleads many thoughtless pharmacists to think that the infusion may be kept in stock.

Prolonged medication with tincture of digitalis often produces nausea and other upward effects. It is stated that a certain fat or fixed oil present in the leaves is the cause. As this substance is soluble in petroleum benzin, the leaves can be freed from it by subjecting them to the action of benzin before making the tincture. The general verdict of the medical profession is in favor of this fat-free tincture, although Hatcher and others deny its preference.

According to Hatcher's experiment, isolated fat from digitalis proved harmless. This probably is true, but would be no proof that even a small amount of this fat in the presence of various alkaloids may not influence their action.

As to the source of the best leaves of foxglove not much literature is available. It is stated that the plant grows in England, Middle Europe, and also in America, and here and there the timid statement is made that soil containing iron is best adapted for its growth. According to Gehe (*Handelsberichte*, 1913, p. 84):

"*Digitalis* is found generally on soil containing iron and manganese, and does not occur in Switzerland on this account. It is assumed that manganese is essential for the life of *digitalis*."

In contradiction of this, Hatcher says:

"Another curious misconception regarding *digitalis* which is hard to explain is that the leaf grown in certain regions is more active than that grown in other localities."

This is probably the most remarkable statement in Hatcher's excellent paper. Whosoever has paid attention to the development of agricultural chemistry, the introduction and first results of which have made Liebig immortal, would rather say: "It would be hard to explain if the leaf grown in certain regions were not more or less active than that grown in other localities." I do not think that a plant of powerful and characteristic properties is known that does not change its nature nor produce its constituents in a larger or smaller quantity when transplanted to a new soil. Every farmer in France and Germany knows that the same potato planted in a marshy soil will produce a different tuber than when planted in a sandy soil. Grape vines brought from the Rhine or Garonne to California will flower and bring fruit, but the grape differs in flavor and amount of alcohol produced. The same vine even differs in different parts of California. Many European aromatic flowers, like chamomile, mullein, and others, grow abundantly in America, but lack the ingredients that make them valuable; and they even differ in aromatic properties in different parts of the home country. Why should *digitalis* be an exception to this general rule? Doctor Thoms, of the Pharmaceutical Institute of Berlin, one of the best and most careful pharmacologists living, states in the last volume of the *Arbeiten aus dem Pharmazeutischen Institut*, 1914, p. 202, speaking of the difficulties of cultivating certain medicinal plants:

"How important, for instance, it would be to have *digitalis*, which in different parts of Germany is subject to such extraordinary variations in respect to its active principles, under proper scientific cultivation and discover the conditions which for the growth and production of the active principles of *digitalis* are most favorable."

The chemistry of *digitalis* is still more confused than its pharmacy, and so far every new assayer has discovered—or claims to have discovered—new principles of various nature. The number of so-called active constituents of the plant is growing daily. Merck & Co., in their annual report of 1911, mention 92 different articles, with their discoverers and properties, and the number has been increased considerably since then. Many of these are identical, and a good many are mentioned only in the papers published by their authors, but were never isolated or brought in the market. Among these many names four stand out prominently, namely, digitalin, digitonin, digitoxin, and digitalein.

The oldest one of these, digitalin-Nativelle, was isolated by the French chemist Nativelle, who claimed it to be a pure substance, while Schmiedeberg, who made

an extensive examination of the plant, pronounces Nativelle's digitalin a mixture of several substances, and gave the name digitalin to another chemically uniform, amorphous body for which he presented a formula. Another digitalin was isolated by Kiliani, another by Homolle-Quevenne, another by Lancelot, another by Lebourdais, and so on. In Merck's list the name of digitalin appears thirty-seven times, each time denoting a different article. No wonder that a confusion prevails and that prescribers and dispensers are at a loss what is meant by digitalin. It is not the object of this paper to enter into the merits of these numerous glucosides for each of which the discoverer or manufacturer claims a certain superiority over others. But in view of these different results obtained by men of great learning, long experience, and renowned ability, we are led to the question if there is not a reason for this disagreement and if perhaps some fundamental facts or principles have been overlooked.

Now, in trying to bring the various results into some classification, we notice that nearly all agree on the fact that some of the products are soluble in water, some insoluble in water but soluble in alcohol. Kiliani states that digitoxin is insoluble in water, Hatcher makes the same statement, while Cloetta separated a soluble digitoxin, to which the name of digalen was given. It is further stated that, while digitoxin is insoluble in water, it becomes soluble in water, best in hot water, in the presence of a certain saponin that is also present and which, according to some authorities, is identical with digitalein, according to others with digitonin. The presence of a saponin is also claimed by a number of other investigators, but by no means by all. It is on this basis that Hatcher makes the claim that the infusion contains all the active ingredients of digitalis held in solution by saponin. He therefore supposes that no change takes place when the infusion cools, although every druggist knows that a slight precipitate forms, and he also must suppose that this saponin and the insoluble digitoxin are present always in the right proportion,—that is, enough saponin to dissolve the digitoxin. As a matter of fact, however, the presence of saponin is still in doubt, and even those who claim its presence do not agree on the quantity, some speaking of a trace only. But nearly all investigators agree on the instability of the various digitalis preparations and the ease with which the one is changed into the other. Some doubt the presence of any pre-existing digitoxin in the plant, believing that it forms, after the leaves are gathered, through the influence of this saponin. We are reminded of bitter almonds, where the amygdalin, through the action of a ferment, is changed into benzaldehyde, hydrocyanic acid and glucose. Might there not be a similar cause in digitalis that would account for the evasiveness of the various chemicals? It cannot be doubted that a soil containing iron and manganese is most favorable to the development of the plant, and, if the claim that manganese is necessary for the production of digitoxin is correct, what hinders us to suspect a certain relationship between manganese and this complex body? To the adherer of the infallibility of the theory of elements such a thought may appear like the outgrowth of a disordered imagination. But other apparently impossible theories have been proved to be founded on facts, and a chemical genius may come some day and upset many of our pet theories. The inadequacy of the chemistry of digitalis should certainly lead the investigators to consider the plant as a harmonious total, and not take out its chemistry as a

part that can be studied and understood without reference to its whole life and development and productions.

It would be wrong to write a review of digitalis without mentioning the physiological tests to which this plant has been subjected in the last two decades. Here the same confusion reigns as in its chemistry. Naturally so. How can we successfully test a chemical before we have absolute knowledge of its properties? Frogs, mice, rabbits, dogs, cats, have been used to establish what is called a standard. But no two investigators agree. These physiological tests are beyond the scope of the pharmacist and physician, as they require especially-arranged biological laboratories that cannot be established without considerable expense. In the same way the physiological chemist requires special training and long experience. Consequently these laboratories are, as a rule, constructed by large manufacturing houses who employ the best talent that they can find. It is natural that these men work in the interest of the firm that employs them and that their researches always confirm the superiority of the preparation that their employers prepare. This is no adverse criticism of their activity. The commercial houses that go to the expense of establishing and maintaining such laboratories try, without doubt, to produce the best articles in every line, and as each and every digitalis preparation has some advantages and characteristics of its own, it is but natural that these advantages are exploited in preference to others. But science gains but little by these efforts, and the skepticism that many entertain in reference to biological tests is justified. This became evident some years ago in New York, when the representatives of a large German manufacturing house undertook a crusade against the sins of certain druggists, as stated, in reality, however, to push and advertise a certain proprietary article. Numerous prescriptions were written by their physicians and then analyzed by chemists of repute, and incidentally a result was obtained that was not looked for. Among the prescriptions were a number for tincture of digitalis. The dispensed articles were sent to a biologist of a good name, who conducted the physiological laboratory of a manufacturing house. He tested them *secundum artem*, without prejudice, and his report was published. It now happened that some of the samples had come from his own house, and had been tested by him, and a certificate as to the strength had been attached to the containers. In his report he declared some of these same tinctures worthless, others too strong. Guaranteed assayed tinctures from other firms shared the same fate. No greater discredit could have been thrown on biological assaying by its worst enemy than by these careful, conscientious examinations. When they were introduced into the pharmacopeia it was stated that they were needed on account of the inadequacy of the chemical test; but, far from solving the problem, they have only added to the confusion and uncertainty.

Before closing I wish to refer again to Thoms' *Arbeiten aus dem Pharmazeutischen Institut*. On page 204 L. Rosenthaler is quoted as follows:

"I am of the opinion that plants produce some of their constituents as a protective weapon against vegetable or animal attacks; but as their enemies do not always have the same geographical distribution as the plants themselves, these protective principles are not needed where the respective enemies are lacking, and consequently are not produced. This supposition explains the fact that the

amount of digitalin of cultivated digitalis is less than that of the wild-grown plants."

This is not a new theory. It has been shown that the cinchona tree produces quinine as a protective against the attacks of certain insects and bacteria, and whenever the tree is transplanted to countries where it is not attacked by these enemies the production of quinine gradually decreases. I also refer to Doctor R. C. Eccles's paper on "Pharmaceutical Bacteriology" in the *Proceedings of the American Pharmaceutical Association*, 1894.

Many other instances of self-protection of plants against surrounding enemies, be they of vegetable or animal nature, or conditions of the atmosphere, could be mentioned. Here, then, is an unexplored field. We generally do not grant self-consciousness and individuality to plant organism, but the few observations that we have made seem to indicate that there is in these low organisms far more foresight and judgment in action than we admit. They may not think, but their work and productions could not be more correct and logical if they had been planned by the most highly developed mind. Nobody ever expects to discover the thoughts of a human being by dissecting his body after death and analyzing the various parts. Can we expect to explore plant life in its conception and its influence on surrounding Nature by dissecting the plant and analyzing what is left after its death?

## Editorial

E. G. EBERLE, Editor.....63 Clinton Building, Columbus, Ohio

### THE DYE INDUSTRY.

**T**HOUGH the subjects are entirely different, the press has followed about the same lines of thought in presenting the possibilities of the dye industry as applied anent the cultivation of drug plants. The most important part of the subject namely, the research involved and the concomitant expenses have been obscured by the initial sources of supply.

More will be persuaded to venture into the cultivation of medicinal plants than will even contemplate the manufacture of dyes. The reason is obvious. Without considerable further experimentation, farmers should not be persuaded into drug plant cultivation as a source of profit, without being informed of the many difficulties they will meet with. The Journal has heretofore and again in this issue published papers on the subject. The work of experiment stations should in every possible way be encouraged.

The European war revealed that notwithstanding a high protective tariff on dyes, only a few and a very small proportion of those used, were manufactured in this country. The question, "Why this condition?" was to be expected; the answers in many instances evidenced lack of investigation. A general answer was indicated last month and may be repeated in these words, "the manufacturers and capitalists of this country have not co-operated with industrial and engineering chemists, not having come to a realization of the creative power and earning capacity of industrial research."

In this issue will be found an article on the "Dye Stuff Situation in the United States," by Thomas M. Norton. Among the many other problems confronting this industry is that the system of profitable production depends upon converting wastes or side-products into salable material. The manufacture of these thousands of products demands scientific control and expensive plants and then research work for their adaptation and successful exploitation.

The time seems opportune for keeping the importance of industrial research in the lime-light of publicity, for the discussions in the papers will be productive of good. Such work should be extended in pharmacy schools; even that done in the past, has developed men who have influenced the industries. We might refer to Herman Frasch for one example. He solved the problem of tapping the inexhaustible sulphur fields of Louisiana, that are 1000 feet below the surface and under 500 feet of quicksands. The striking feature of the largest sulphuric acid plant in the world, located at Ducktown, Tenn., is that the acid is made from smelter fumes, the nuisance of other plants. These references are only made to point out the very close relation of our laboratory work with methods that render manufacturing enterprises profitable and promoting others.

Arthur D. Little, of Boston, said recently, we should leave the dye business to the Germans, and consider some of the other things we might do with the vast

expenditure of effort, money and research that would be necessary to rival the Germans in that line.

He makes the statement that we waste 150,000,000 tons of wood a year; a billion feet of natural gas a day; coke ovens flame for miles in Pennsylvania and Colorado, wasting precious ammonia. One-tenth of the research, energy and skill which would be required to rival the German dye industry, if applied to the lumber industry of the South, would result in the creation of a whole series of great interlocking industries, each more profitable than lumbering. The South would be in position to dominate the paper market of the world, he says, transport denatured alcohol by pipe line and tank steamers, make thousands of tons a day of carbohydrate cattle feeds.

We have not made these statements to detract from the dye industry, which presents greater opportunities for pharmaceutical research, but to indicate the numerous avenues for applying our studies.

Finally we repeat that the accomplishment of great things in our related industries requires confidence and co-operation and the practical appreciation by our financiers of the earning power of research. In giving financial aid to research, colleges of pharmacy are entitled to consideration, for these institutions have largely contributed, directly or indirectly, to the development that sustains the chemical and other manufacturing industries, and such assistance will be many times repaid by the production of further opportunities and the discoveries of more economical manufacturing methods.

#### NOT MORE LEGISLATION, BUT BETTER LEGISLATION.

**W**E are pretty well agreed that too many laws are passed and quite a few of these are not adapted to the ends in view.

Systems of business have been radically changed in recent years in order to give more efficient service. The details of conducting a modern business house, especially the methods of publicity are very different to-day than they were ten years ago and the change has affected the manufacture and selling of drugs. Sacrifice of time and money and capable men who were willing to co-operate, has made the reforms possible. Years of experience under former systems and methods not only pointed out the necessity for change but developed the knowledge for practical application.

There is considerable truth in the assertion that our country is coming to a period of statutory morals of justification of any act not prohibited by statute; it is sought to correct and regulate everything by law, whereas there should be a deeper sense of personal, social and public duty. The Hon. Thomas W. Shelton, of Norfolk, Va., said recently: "This country needs fewer laws and more real men; less jural regulation and more moral sensibility; fewer codes and more decalogues." The intelligence of a people is reflected by character, and the stability and quality of government depends on the moral evolution of its citizens.

We advocate preventive medicine and are fully convinced that there is wisdom and economy in the correction of conditions that breed disease. This we have discovered through practical experience. It would seem that experience with unsatisfactory systems of legislation and impractical laws should have instilled suf-

icient wisdom for legislative reforms. States have become deeply interested and some of them have nullified numerous laws, but so far this has amounted to little more than patch-work, erecting further structure on the same defective system.

We must have laws, but the methods of framing and enforcing them can be materially improved. The topic has been freely discussed in the magazines and there is no reason why we should not participate, as our work occasionally comes within the range of the legislators' aim. Though the laws relating to pharmacy may not be altogether satisfactory, we have fared remarkably well and the object of this writing is not a discussion of laws, but if possible, to assemble a few familiar thoughts anent the causes of defective and superfluous legislation.

Intelligent understanding of widely different subjects is necessary for enacting laws. Vigilance is required so that proposed legislation may be scrutinized, and initiative combined with persistence, is essential for needed legislation. Deficiencies promote divided responsibilities and willingness to take chances, that somewhere and somehow, if proposed legislation is not needed, the bill will not be enacted.

The recognition of legislators depends largely on their success in carrying bills through or killing those proposed by another; most of them come with local measures or promises that have secured them election. These are the predominant thoughts, rather than the study of general public interests. The protection of the latter is "everybody's business" and in practice it is "nobody's business."

Now as to divided responsibility, the lower house depends on correction by the upper and it in turn expects the Governor's veto if the measure is imperfect or undesirable. Within the several bodies there is also a divided responsibility, looking to chairmen or presiding officers for direction. The responsibilities are thrown backward when inquiry demands an explanation, and so no one definitely assumes responsibility.

The same practice obtains relative to measures that should be enacted, the responsibilities are shifted back and forth until about all that is known is, that the provision did not materialize.

Non-enforcement of laws and inefficiency of officials is also traceable to divided responsibility. The law is blamed, the judge or other officers, the grand jury, but the blame is seldom definitely fixed. The conduct of our public affairs is too frequently placed in the hands of plausible politicians. Competency is usually a demand of business, though many a large business has declined because a father's son or personal friend needed a job. In the selection of legislators and officials preferment is often given on account of political claims or sectional recommendation; lawyers secure many of the odd jobs in public service in consideration of their speech-making, prior to election.

Walker D. Hines in an article in the *Atlantic Monthly* for May on "Our Irresponsible State Governments," says:

"The American people have come to assume an attitude of indifference and hopelessness toward the state governments. Legislatures are expected to prove failures. Governors and other state officials are expected to be inefficient. The work of local officers is rarely taken very seriously, and is expected to be spasmodic and fragmentary. The public rarely has any disposition to locate respon-

sibility for inefficiency in affairs of general interest, because the inefficiency is so general and the search for responsibility is so hopeless. Is it not fair to say that our scheme of divided responsibility has been a school for the encouragement of political inefficiency, and for the promotion of petty local interests at the expense of the general welfare, and has supplied an atmosphere devoid of stimulus to efficient work?"

The legislative system can be improved just as business has become more efficient by fixing not only responsibility but demanding intelligent and studied cooperation. We should realize that laws without men avail little, that they must be honest, but also have vision and courage. Our attitude should encourage capable men to give their time to the important duties of legislation and office instead of erecting obstacles that intensify tendencies in the opposite direction.

What the American people of to-day need is not only preventive medicine, that is, the adoption of rules of conduct that will eliminate the possibility of illness and the unnecessary use of drugs, to the end that the public health may be conserved; but also, preventive law, that is the cancellation or codification of existing laws, and not the enactment of new ones; and the education of the public, or rather the individual units composing the public, which go to make up public opinion, regarding their civic responsibilities. If the moral sense of the people of a city, state or nation, be raised, it will follow that the morale of the city, state or nation will be raised, also.

#### AN IMPORTANT RULING ON THE HARRISON LAW.

**P**HARMACISTS as well as physicians have been more or less concerned regarding the amount of narcotic that may be dispensed and prescribed for a patient. The law itself, leaves the decision with the pharmacist and physician, under the provision that the dispensing and prescribing must evidence good faith and not evade the purposes of the act.

The quantity for treating habitues will differ and in every instance, a larger amount will be prescribed than required in general practice. The Commissioner of Internal Revenue has issued a ruling under date of May 11, as follows:

"Where a physician, dentist, or veterinarian prescribes any of the aforesaid drugs (those included in the provisions of the Harrison law) in a quantity more than is apparently necessary to meet the immediate needs of a patient in the ordinary case, or where it is for the treatment of an addict or habitué to effect a cure, or for a patient suffering from an incurable or chronic disease, such physician, dentist, or veterinary surgeon should indicate on the prescription the purpose for which the unusual quantity of the drug so prescribed is to be used. In cases of treatment of addicts, these prescriptions should show the good faith of the physician in the legitimate practice of his profession by a decreasing dosage or reduction of the quantity prescribed from time to time, while on the other hand in cases of chronic or incurable diseases, such prescriptions might show an ascending dosage or increased quantity. Registered dealers filling such prescriptions should assure themselves that the drugs are prescribed in good faith for the purpose indicated thereon, and if there is reason to suspect that the prescriptions are written for the purpose of evading the intentions of the law, such dealers should refuse to fill same."

This ruling requires that the dispensing and prescribing of unusual amounts of narcotics must be made a matter of record. The habitue may, of course,

object to such information passing from the physician to the pharmacist, but the ruling conforms to the purpose of the law, namely, to stop illegitimate use. Pharmacists will doubtless be pleased to have this ruling and it is for that reason editorial reference is made. How far the pharmacist will be expected to go in establishing good faith on the part of the physician, is a question of some importance in the larger cities. Physicians who treat habits will write more prescriptions for narcotics than regular practitioners.

### THE STEVENS BILL.

**O**PPONENTS of the Stevens Bill base their case on alleged restriction of trade that would follow its enactment.

No one will deny that monopolies have generally been established by unrestricted competition, promoted by price-cutting. One of the weapons of monopoly is to cut the price when a small dealer endeavors to compete; after he fails or sells out to the combination, prices are again restored. This seems to be true in oil dealings, the cause of idleness of cinnabar, copper and iron mines, etc. Monopolistic advantages obtain when concerns own stock in transportation companies that make special rates or grant rebates to the favored few; delay transit, thereby destroying the trade, profit or goods of those who dare compete.

Under the Stevens Bill a manufacturer may create a special value for an article in the mind of the public, but if corresponding merit does not exist, certainly another manufacturer of a similar article, but materially better, becomes a competitor. Price maintenance has for its purpose the *prevention* of restraints of trade and the practices which suppress competition and make monopoly possible.

The Stevens Bill would legalize restricted sales of certain merchandise, just as real estate transfers may provide protection against undesirable occupation, use or resale. Every one is familiar with such restrictions and no one considers these unjust or non-enforceable. Injury could otherwise be done to residential sections of a city. Equally as great injury is done to a manufacturer when the market for an article he has established is destroyed by cutting prices on such goods. Nobody is forced to buy articles on which a price has been fixed by the manufacturer.

The Stevens Bill simply presents that manufacturers have a right to protect their property by similar restrictions recognized as lawful in connection with real estate. The recognized opposition to the measure ought to furnish sufficient argument for the retailers that their stand should be enthusiastically favorable to the Stevens Bill. Retailers should also be assured that the bill will never become a law unless they exert themselves and give moral support to those who are endeavoring to promote its enactment. We speak for the measure at this time, because the associations of various states hold their annual sessions during this and succeeding months.

## IN AID OF BELGIAN PHARMACISTS.

LAST November the Netherland apothecaries inaugurated a plan, providing assistance for Belgian pharmacists who had suffered loss as a result of the European war. While realizing that their financial ability was not adequate, they believed their initiative would encourage pharmacists of other neutral countries to join them in this worthy undertaking.

The contemplated fund is to be placed in the hands of a Belgian Commission and the money thus collected loaned without interest to their Belgian colleagues. The Netherland committee of pharmacists felt assured that if the Belgian Commission could say to pharmacists in other countries that in Holland 50,000 francs had been subscribed, liberal responses would be forthcoming.

A letter from Amsterdam, addressed to the American Pharmaceutical Association in March, and signed by President J. J. Hofman and Secretary J. F. Suijver of the Netherland Society for the Promotion of Pharmacy, advises that 25,000 francs have been subscribed. With this communication, an authentic list of Belgian pharmacists, who have lost everything, is transmitted, and also views of quite a number of ruined pharmacies.

The encouragement of the American Pharmaceutical Association is solicited, and this reference is made so that the members may consider the subject, preparatory to action by the Association or as individuals. In this connection it may be said, that the Philadelphia College of Pharmacy has responded to the call; we are not advised as to whether other institutions have done so.

The subscription is to be made up of 100-franc shares and the intention is that this shall constitute a loan-fund, though it is indicated that repayment will doubtless be slow. Pharmacists of Belgium who have sustained loss of their pharmacies will be loaned an amount to be decided upon by the Belgian Commission, without interest. Five hundred Holland pharmacists have been asked to donate and out of that number 192 had responded at the time the communication addressed to the American Pharmaceutical Association was written. The Commission is to make periodical reports of contributions and expenditures.

It should be understood that the creation of this loan-fund is only for the benefit of Belgian pharmacists and is to be distributed after peace has been restored. We make no further comment than to ask the members to give this communication, which expresses the sympathy of pharmacists in one country for afflicted colleagues in another, fraternal consideration.

## PAN-AMERICAN FINANCIAL CONFERENCE.

WHILE this editorial must be written, even before the Pan-American Financial Conference convenes, pharmacists, as all other American citizens hope for its success. Invitations were extended by the United States to every other American Republic, and all except Mexico and Haiti will be represented.

In a communication to the press, Mr. John Barrett, Director General of the Pan-American Union, said:

"Pan-America and Pan-Americanism are becoming the slogans of the hour. The people of this country are awakening, as never before, to an appreciation

of the importance of the relations of the United States with its twenty sister American Republics. These countries and their peoples, in turn, are showing today a more kindly feeling than they have ever done before toward the United States and its people. While the work and propaganda of the Pan-American Union, the official international organization in Washington of the twenty-one American Republics devoted to the development of commerce, friendship and peace among them all, together with the attitude and addresses of its governing board, has been in a large degree responsible for this new spirit of Pan-Americanism, the European war has also been a mighty influence in its promotion.

"Considering the effect of great political and international events in history, it might be said that the European war has done more than any other similar influence, since the declaration of the Monroe Doctrine in 1823, to encourage solidarity, common sympathy, common interest and common purpose among the republics of the Western Hemisphere. In other words, the silver lining of the European war cloud is the favorable effect which that terrible conflict has had upon the commercial and political relations of the American nations."

We are interested largely because of the opportunities for our chemical and pharmaceutical industries. Incidentally, we have made reference to this important conference, in order to again bring up the subject of more general use of metric weights and measures. While quantities of the Pharmacopœia are designated in that system, drugs and chemicals that enter into the manufacture of the preparations are still bought and sold by the pound.

The money units of the South American republics are very similar to ours; if we are not misinformed, most of them employ the metric system commercially, hence they would undoubtedly prefer that this system of weights and measures be used in our dealings with them. Means of exchange are helpful factors in the promotion of business relations.

The commercial use of the old system of weights and measures frustrates the efforts of schools to establish the metric system or even such endeavor through official recognition.

The National Grocers' Association, at their annual meeting last month in San Francisco, voted in favor of the adoption of the metric system. Voting to do so, and putting this into practice are two entirely different propositions; one is easy, the other is apparently difficult—the remark is based on our experience.

In view of the fact that an International Pharmacopœia seems improbable, a Pan-American Standard might be attempted. It may be taken for granted that the Pan-American Conference will indirectly promote a more extended use of the Spanish Edition of the United States Pharmacopœia in South America.

#### THE GRADUATES.

**D**URING the last few weeks, parting words of advice have been spoken to graduates of Pharmacy Schools. The graduate's further task now is not only that of pharmacist but citizen, accompanied by stern responsibilities and charged with the accomplishment of duty—the battle of life against many tempting, ignoble and base circumstances. A good pharmacist is greater than he who taketh a trench; though this may be the result of heroic determination, the

task is of short duration. It is a life-long effort to be a good pharmacist, each day beset by mines and submarines and poisonous gases that attack his character. The graduate pharmacists have great advantages over those who have not had these opportunities; their responsibilities are correspondingly greater, neither can they plead unpreparedness for duties they must assume. They are expected to be leaders in their profession at home and in the ranks of pharmaceutical associations. The graduates of pharmacy, of whatever title or degree, are cordially invited to membership in the American Pharmaceutical Association, so that they may be helpful and profit by such co-operation.

E. G. EBERLE.

Panama-Pacific International Exposition

## FIELDS AND WOODS IN JUNE.

WILLIAM C. ALPERS.

A stroll through the fields and woods in June is a delight and recreation. Every pharmacist should take a day off and inhale new hope and confidence with the fragrant air of budding and flowering nature. It is true, the first messengers of spring have disappeared. The lovely sanguinaria with its snow-white dress greets us no more and the saucy jack-in-the-pulpit does not preach his silent but impressive sermon any longer. But there is ample cause for enjoyment and admiration. Over yonder through the woods we discover a cluster of white blossoms, not showy, but nevertheless attractive. If we only look at the leaves of the shrub we might think it is a young maple. But the blossoms tell us that it is the viburnum that welcomes us. It is a flowering shrub masquerading in the guise of a tree. We might call it the joker of the woods. There are other masqueraders of the June woods. At a distance we see a wild rose, at least we think so. And even when we approach we do not doubt its identity. It is big and rich in color. But the stem of the plant has no thorns, and almost bewildered we again examine the flower. And now we discover that it is the showy blossom of the flowering raspberry, having a striking resemblance to the wild rose, although entirely different from the ordinary raspberry flower that nearly everybody knows. In strolling further we rejoice at the splendor of a cluster of iris versicolor with their light blue petals. This beautiful flower loves company and never grows alone; there is always a whole family, a whole tribe together, kissing and gossiping with each other. The ground becomes moist and swampy and we are about to turn, when from behind an old half-decayed trunk of a tree a nodding leaf seems to invite us to come nearer. Our efforts are well rewarded, for there almost hidden in a fissure of the tree grows the lovely orchid, the cypripedium, the showy ladies slipper rather reluctant to show its beauty. Thus we stroll from bog to bog, from bush to bush, and inhale the sweet fragrance of the elderflower that early spring has coaxed to unfold before the time. A foolish June bug buzzes into our ear and almost frightens us. Of course, he could not harm any one, and he is all too gentle to do so if he could. And he has neither beauty nor song to atone for his clumsiness. It seems he is made to blunder and annoy.

In our enjoyment of the beautiful June air we do not notice that the sun is going down; the shadows of the trees grow longer and the enchanting charm of the forest twilight gradually surrounds us. We know that it is time to leave the woods, as we might lose our way if total darkness befalls us here; and yet we linger, drawn back by the hands of fairies and sylvan spirits. Here and there a sudden light flares up. Fireflies have lit their candles and show us our way. Before us a large meadow expands. We stop in order to inhale once more the refreshing air full of ozone and terpenes. But we cannot proceed, a new charm retards our steps. This time it is not the eye that is enraptured, it is the ear. We now know that the fireflies were only the first announcers of the concert

that is to come. They arranged the notes and instruments. Here and there a chirp, a rasp is heard, like the tuning of the string before the real performance begins. Full of expectation we lean against a tree or stretch out under a sweet-smelling elder bush. Everything is ready and full of inspiration drawn from the beautiful June night, the thousands of nocturnal choristers of the grass sing and play their notes. There is a buzzing and chirping and trilling and rasping without end; each in itself perhaps without account and not much to listen to, but the blending is restful and charming and almost overwhelming.

And now comes the soloist of the bug orchestra, a tree toad, that sings its note with a serious deep voice but full of enthusiasm. The chirping of the bugs is more than a summer's monotonous lullaby, it becomes the musical background of a more skilled performer and assumes a new higher quality. Suddenly the soloist ceases and it appears as if everybody was quiet; the solemnity and grandeur of a June night seems for a moment to overpower all the other charms. Then he begins again—perhaps he has only stopped for refreshments and eaten some of his musicians—and anew the little buzzers and chirpers intonate their songs.

As we listen in rapture we try to analyze the performance and identify the individual performer, the cricket, the grasshopper, the locust, the golden beetle and others. But we fail in our task and wearily close our eyes, not to sleep, but to relax into a sweet vagrant reverie. Dream pictures appear before us as from the embers of an open fireplace in midwinter. Sweet recollections of our childhood and scenes of days long past and almost forgotten rise in our minds, and the untiring song of nature recalls the harmonies of a Beethoven sonata or Liszt's rhapsody to our ears, when in the circle of a contented family we mused in the twilight while a beloved one, long departed, gently touched the keys with magic finger.

The commercial druggist who knows no music but the clang of coin, may laugh and sneer at our weird imagination that sees beauty in useless weeds and hears melody in the noise of bugs. Let him sneer, poor man. He knows not what he misses. The revelations of nature are for him a sealed book, and his heart never thrills in ecstasy of the wonderful pleasures that she willingly gives to those who understand her, pure and innocent, sweeter than music, richer than gold.

---

#### DYESTUFF SITUATION IN THE UNITED STATES.\*

---

THOMAS M. NORTON.

---

If the plans of the officials of the Commerce Department shall materialize, the urgent suggestions made by the experts of that and other departments of the government, who are constantly examining into the situation with respect to dyestuffs, will be carried out by President Wilson's administration in urgent recommendations that Congress shall safeguard any developments of the dyestuffs industry in this country by effective legislation in the form of an anti-dumping clause, or such amendments to existing laws as will prevent the German dyestuffs manufacturers flooding this country with their products and putting the domestic industry out of business when the European war shall end. It is known that

---

\*Oil, Paint and Drug Reporter, May 24, 1915.

strong recommendations have been made that President Wilson shall take a positive stand on the subject. Such suggestions have been made by Commercial Agent Thomas M. Norton who virtually has charge of the investigation and developments of the situation, so far as information regarding dyestuffs in this country and in foreign countries is concerned.

A summarization has been made by Dr. Norton in connection with his report showing in brief form the points he has brought out. He has itemized these points as constituting factors of controlling importance in the general situation as to dyestuffs production. He says:

In reviewing the general situation the following factors are of controlling importance:

The stocks of dyes of German origin in American warehouses and mills is rapidly approaching exhaustion. It will probably disappear before the end of July.

Permission for the free passage of two cargoes of German dyes for American consumption—sufficient for two to three months—was granted by the British government on April 14, but thus far permit for export has not been granted by the German government.

An ample stock of coal-tar dyes, ready for export to the United States, is held by the German manufacturing firms. It awaits the opportunity and assurance of safe transport.

The importation of Swiss dyes—forming normally about 9 percent of the total imports of artificial colors, and exceeding \$9,000,000 in annual value—continues in diminished volume. The value during the March quarter, 1915, was \$191,000.

The existing American coal-tar chemical industry is making every effort to increase its output, and is rapidly overcoming the handicap resultant from its dependence in the past on German intermediates. This output will steadily increase with each passing week from now on.

An ample supply of American coal-tar crudes is assured for the prospective needs of dye-stuff manufacturers.

The American manufacture of aniline and other coal-tar intermediates, from American crudes, has been started upon a generous scale by all existing dye-stuff works, and by five new plants specially devoted to this field. Several other works are in process of erection or in contemplation.

The foundations for a genuine American coal-tar chemical industry are apparently being laid.

This industry can supply only a small share of the American demand for the current year, but is susceptible of steady and relatively rapid expansion.

No provision is yet made for the American manufacture of alizarin or of synthetic indigo.

American consumers of artificial dyestuffs are promptly taking steps to use natural dyestuffs and mineral colors during the time that the output of American dyes is necessarily limited.

American manufacturers of natural dyestuffs in the form of pastes, extracts, etc., are making adequate preparations to supply the expected demand. They are providing ample instruction in the modern approved methods of using vegetable dyes.

There is a general recognition of the fact that the prospective scarcity of artificial dyestuffs is due to circumstances entirely beyond the control of the American government and of the American color industry, and that both are making every effort to lessen the inevitable hardships attendant upon the unprecedented conditions.

Consumers of dyestuffs are resolutely adjusting manufacturing processes, so that they may be prepared in time to revert to the use of natural dyestuffs or mineral colors with a minimum of friction should the necessity arise. Consumers of dyed materials are good-humoredly accommodating themselves to a prospective limitation in the gamut of colors. All sense of hardship disappears before the huge pall of misery and suffering hanging over the countries now engaged in the struggle that has caused this temporary famine in a class of materials almost indispensable to many American industries.

#### IS A SELF-CONTAINED AMERICAN COAL-TAR INDUSTRY PROBABLE?

The spontaneous effort on the part of American capital and enterprise to meet the exigencies of the present emergency reveals the existence of dormant possibilities of far-reaching importance.

Adequate steps have been taken to assure an abundant supply of all the coal-tar crudes needed by a well-rounded American coal-tar industry as fast as the demand develops.

A strong effort is being made to establish upon a firm basis the manufacture of a wide range of American coal-tar intermediates.

The manufacture of a limited number of staple coal-tar dyes is being pushed with remarkable energy, and the number of these dyes promises to increase steadily.

Evidently much has been done during the last few months to lay the foundations of a genuine national industry, capable ultimately of meeting the great mass of American demands for artificial dyestuffs.

Unquestionably much of the capital invested during the last few months has been in the nature of a speculation. At current rates for aniline and for finished dyestuffs there was a fair chance of quickly covering the cost of a new plant, of making a good profit, and of being in a satisfactory shape at the return of normal conditions to embark in competitive manufacture under favoring circumstances.

Numerous interviews with those who have participated in these preliminary steps in the evolution of a national industry have brought to light a marked confidence on their part in the final success of the undertaking, provided the capital invested is exposed to no more danger than that involved in fair and open competition with foreign manufacturers of dyestuffs.

Capital hesitates under existing conditions to embark heavily in an undertaking where there is a strong probability, if not a certainty, that upon the return of normal conditions an incipient, half-developed American industry would be exposed to prolonged and relentless underselling by foreign competitors possessing almost boundless resources, financial and technical.

There is a very strong conviction among those experienced in the industry and among those just entering it that the majority of the coal-tar intermediates required in making dyes, and the great bulk of the coal-tar dyes now imported from

Europe, can be profitably manufactured on American soil under existing tariff rates if there is adequate statutory protection against the so-called "dumping" of foreign wares; or, in other words, protection against unfair competition in restraint of trade by persons or firms outside of American jurisdiction.

Whether public opinion will recognize general legislation in this direction as of urgent necessity remains to be seen. There seems, however, to be no question but that ample capital is available for the needs of an American coal-tar chemical industry, and that a large measure of enterprise and technical skill is ready to enter the new field, provided this one serious obstacle is definitely removed.

There are no plans in view at present for any attempt to establish in our country the manufacture of those coal-tar dyes which for a number of years have been upon the free list, namely, synthetic indigo, synthetic alizarin, and the various anthracene and carbazol colors. They constitute about 20 percent of our imports of foreign dyes. The establishment of works for producing these colors can profitably be postponed for a few years, as the complete installation of adequate plants to produce the remaining 80 percent of artificial dyes involves problems not to be solved entirely in one or two years.

After thus summarizing the points brought out in his report it is well to call attention to the details as they are set forth by Dr. Norton, covering the present supplies, activity of American manufacture and the present output of finished coal-tar dyes. Mention is also made by Dr. Norton of the educational propaganda which he seeks to demonstrate is necessary to a complete understanding of the requirements of the situation. This part of Dr. Norton's report is as follows:

The scarcity of artificial dyestuffs is being felt more and more acutely each day throughout the country. The great textile interests, the manufacturers of paper, ink, varnish, pigments, leather articles, feathers, etc., find it increasingly difficult to obtain needed supplies of colors. Many brands have completely disappeared from the market. Small supplies of Swiss coal-tar dyes, shipped via Bordeaux, are still received. Since March 19 no shipments from Germany have entered American ports.

#### HOW CONSUMERS ARE FACING THE SITUATION.

Some large consumers of dyestuffs were far-sighted enough to lay in very heavy supplies immediately after the outbreak of the European war. One of the largest textile firms in New England has now on hand a stock adequate for its needs until the beginning of next winter. There are a few other houses similarly supplied, but the number is very limited. Most of the textile and other works dependent upon dyestuffs have not attempted to carry a reserve above what would cover normal consumption for a period of about two months. Such reserves have tended to decrease as a result of the restricted distribution from the stocks of importing agencies. The great mass of consumers of foreign-made dyes will probably have exhausted their supplies by the middle of July, 1915, under existing conditions.

The majority of such consumers appear to have begun promptly to make preparations for the inevitable changes following a cessation in the customary supply of colors. These changes are manifold in their nature. They involve alterations and modifications in styles and color schemes, the utilization of dyeing materials requiring unfamiliar methods of application and a more or less serious

dislocation and readjustment of all phases of manufacture dependent upon the element of color.

Careful attention has been given to the supplies of aniline dyes that the few American manufacturers of such products are able to place upon the market in the immediate future. In most cases the technical staff is earnestly studying the problems connected with a temporary use of natural dyestuffs.

#### ACTIVITY OF AMERICAN MANUFACTURERS.

In all this period of uncertainty and anxiety, when vast business interests are threatened at a vital point, there is something decidedly cheering in the enterprise and intelligence being brought to bear to solve the difficult problem in a genuinely national way.

With each added week since the shipment of German dyes has been placed under embargo, and each successive indication that a lengthy period must probably elapse before the customary machinery of supply can again be set in motion, there has been a steady growth in the feeling throughout wide circles that the time is ripe for our American coal-tar chemical industry to expand from its present very modest proportions to a position where it can become the dominant factor in meeting the needs of sister industries.

This conviction is finding practical expression in a variety of directions. A review of what is being done shows clearly that not only is every effort being made to meet the urgent demands of a critical situation, but that the foundations are being laid for the more permanent evolution, along natural and healthful lines, of a distinctly American color industry, using American raw material and meeting the bulk of American needs.

The three phases of the complete industry are the production of coal-tar "crudes," of "intermediates" or semi-manufactured compounds, and finished dyes. Along all three lines pronounced progress has been made during the last few months.

#### MANUFACTURE OF COAL-TAR CRUDES.

The erection of adequate recovery plants in connection with coke works is making rapid progress. In addition to a list of such plants given in Commerce Reports for April 20, 1915, mention may be made of the new Laclede Coke Works at St. Louis, built at an expense of \$2,000,000. Active operations begin June 1. The daily consumption of coal is 1,000 tons. Ample provision is made for the collection of by-products. The large Zenith Coke Works at Duluth have recently completed the installation of a benzol-recovery plant. Within a few weeks the daily output of benzol from American coke works will exceed fifty tons. Inquiries made at the Bureau of Foreign and Domestic Commerce regarding constructors of by-product recovery apparatus show that there is a widespread interest in stopping the current wastage of a valuable by-product and in insuring an increased supply of raw material for the use of dyestuff manufacturers.

Under ordinary circumstances this rapid development in the output of benzol, naphthalene and the other important crudes would have meant an oversupply. As it is, the demand for benzol and for toluol in the manufacture of high explosives, chiefly in the forms of picric acid and of trinitrotoluol, has become so

pressing that the current prices for the two hydrocarbons, when not covered by contract, are at least quadruple those prevailing a year ago.

This circumstance hampers to some extent the efforts of those engaged in the manufacture of intermediates. The price of naphthalene, also, has rapidly risen during the last few months. Before the war two-thirds of our current consumption was imported from Great Britain and Germany. It is probable that with the steady expansion of by-product recovery plants in the coke industry and the enlargement of the facilities in the work for separating and purifying the various crudes, prices will now begin to fall, at least for benzol and naphthalene.

#### PRODUCTION OF INTERMEDIATES.

The manufacture of intermediates is actually the most difficult part of the whole problem connected with the dyestuff industry. The production of finished dyes from the various intermediates is in most cases relatively much simpler than the transformation of crudes into intermediates. Hitherto American makers of artificial dyestuffs have depended almost exclusively upon intermediates of German origin. Since the outbreak of the war in Europe it has become clearly evident that the manufacture of the leading intermediates on a generous scale is necessary to the continued activity of American dyestuff plants and the evolution of an independent, self-contained industry.

#### ANILINE OIL.

The most important intermediate is aniline. The equipment of a large plant for the manufacture of this product by the Benzol Products Company has been the most important factor in the situation. The output of the works at Frankford and Marcus Hook, in Pennsylvania, is now sufficient to meet the needs of American dyestuff makers. The Edison Company has likewise established a large plant for the production of aniline at Orange, N. J. It is in active operation and will be enlarged.

The E. I. du Pont de Nemours Powder Company of Wilmington, Del., has acquired the large works of the Bayway Distilling Company at Elizabeth, N. J., used for rectifying and preparing pure benzol and toluol, and has arranged for manufacturing aniline from such benzol as may not be required in the production of high explosives.

At Elizabeth, also the Midvale Chemical Works of St. Louis is erecting a large plant destined for the manufacture of aniline and other intermediates, and ultimately of finished dyestuffs. The plans are extensive and include separate buildings for each product.

It is plain that very ample provision is being made for the production of aniline on a large scale. There will be an adequate supply for manufacturers who are engaged in the preparation of more complex intermediates derived from aniline — dimethyl-aniline, etc. — and of the aniline dyes made from them. There will also probably be a large amount of aniline salt available to use in dyeing aniline black.

#### NATURE OF CONTRACTS FOR INTERMEDIATES.

The output of these aniline works is largely contracted for ahead. A typical contract runs for three years, beginning with July 1, 1915. The buyer fixes in the month of May, preceeding each year, the amount of aniline required monthly,

during the twelve months commencing July 1. This amount may be increased or diminished in any month by the buyer to the extent of 5 percent. He may not increase his monthly average for an ensuing year by more than 10 percent except at the option of the seller. Subject to these conditions the buyer purchases from the seller all aniline oil to be used by him during the three years. The price may vary between 10.93 cents and 25 cents per pound during 1915 and between 10.93 and 15 cents after January 1, 1916. It is to be regulated "by the fair, average market price in the United States, as the same may be determined by competitive offerings and sale." The contract "embodies the terms of a co-operative effort, which it is intended will lead to the establishing in the United States of a coal-tar chemical industry. It is entered into by the buyer with the intent of furnishing the seller with a firm outlet, at a fair price, for a large portion of his production during the currency hereof, and with a view of encouraging the seller to embark and continue in the manufacture of aniline oil and other derivatives of crude benzol on a large and permanent scale; and in order that the buyer may derive the benefits consequent upon securing at a fair price an ample, adequate and permanently regular supply of prime aniline oil of domestic manufacture on a preferential basis."

A contract of this nature appears to be regarded as well adapted to meet the exigencies of the situation and has been readily accepted by users of aniline. It relieves dyestuff manufacturers from the responsibility of providing their most important intermediate, and leaves them free to concentrate their efforts upon products of a more complex nature, involving a higher grade of technical skill and operations of a more difficult character. At the same time the American aniline industry has three years' leeway to establish itself so firmly that it may easily resist all foreign competition of a legitimate character.

Aniline was sold in American markets at 10 cents per pound a year ago. Evidently a minimum of about 11 cents is regarded as the lowest price at which it can be produced in this country at a fair profit.

#### OTHER INTERMEDIATES.

The American manufacturers of coal-tar dyes have taken up seriously the production of those intermediates needed to make the more important colors which they have hitherto furnished to the American trade.

The Schoellkopf, Hartford & Hanna Company, at Buffalo, the oldest and largest of the American establishments, started last autumn extensive preparations in this field. It has now seven complete plants for the preparation of various intermediates. The attempt has not been made to produce at once all of the numerous intermediates that were formerly imported from Germany. A sufficient variety, however, is now in regular process of manufacture to enable the company to produce regularly such colors as formed the bulk of its output before the war.

This policy is evidently dictated by the circumstances, which plainly require in the interests of American consumers that there should be a maximum output in the shortest time possible of a small group of recognized staple colors.

Essentially the same policy has guided the activity of the smaller plants. The W. Beckers' Aniline and Chemical Company, at Brooklyn, is erecting twenty-

three buildings in its new plant. Of these seven are completed and manufacturing operations have already been started. The firm will make all of the fourteen intermediates required in the production of the group of dyes that it carried on successfully before the war.

The same is also true of Heller & Merz and of the Central Dyestuff Company, of Newark, N. J. Each of these two firms is erecting commodious new buildings and starting the manufacture of the intermediates formerly imported from abroad.

In addition two new companies have been organized for the manufacture of coal-tar products, the American Synthetic Color Company, at Stamford, Conn., and the Standard Aniline Company, at Wappingers Falls, N. Y. Both have well-equipped plants and have already begun the manufacture of intermediates, delaying for the time being any attempt to turn out finished dyes.

The more important intermediates hitherto imported from Germany and now being manufactured regularly in the United States are: Aniline oil and salts, A and B naphthols, para nitraniline, dinitrobenzol, dinitrotoluol, toluidine, nitro-toluidines, toluylenediamine, A and B naphthylamines, phenylenediamine, phthalic acid, acetyl-salicylic acid, salicylic acid.

The names of the intermediates are arranged in the order of the extent to which they have been imported, aniline leading the list.

It is also of interest to know that one manufacturer has found it feasible to make a very satisfactory grade of dinitrochlor-benzol, the all-important intermediate for the production of fast sulphur black, a dye now used in vast amounts in this country, especially for hosiery.

#### OUTPUT OF FINISHED COAL-TAR DYES.

Of prime importance to the numerous categories of consumers of dyestuffs is the question, How far will American color works be able to meet the deluge of demands as the date approaches when the supply of German-made dyes will be entirely exhausted?

There is no question but that from now on each day will see an increased output of American-made coal tar colors.

The large works at Buffalo are now running night and day, busying six hundred operatives. The volume of the output is already double what it was before the war. Manufacture is concentrated upon a few staple dyes, chiefly in demand, the lack of which would be felt most severely by the great textile interests. This firm has brought out a direct black capable of replacing satisfactorily, as far as quality is concerned, both aniline black and sulphur black. It is felt that the use of this dye, along with the rapidly increasing output of aniline available for aniline black, will go far to lessen the hardships attendant upon a complete disappearance of German-made sulphur blacks from the market.

The smaller companies at Newark are straining every nerve to bring their output up to the normal amount manufactured regularly before the war, and hope soon to advance far beyond those figures.

It will probably require more than two months for the Brooklyn plant to attain the volume of output customary before the war and before the disastrous ex-

plosion and fire of last autumn. There is every indication that these works will rapidly expand and become an important factor in the situation.

E. C. Klipstein, of 644 Greenwich street, New York City, is meeting with success in establishing the manufacture of the oldest sulphur color, Cachou de Laval, a fast brown susceptible of many applications, and is extending operations to other sulphur colors.

The American branch of the famous Bayer Company, one of the leading German dyestuff firms, is located at Rensselaer, N. Y. It has been practically closed for some months, but will resume active operations on July 1. Prior to the war the firm manufactured nigrosines, alkali blue and a few other colors especially in favor in the American market. The intermediates required were imported from Germany. The company now plans to resume the manufacture of the same colors, making also the needed intermediates from American crudes. The firm will employ 350 operatives, a part of whom, however, will be occupied in the manufacture of coal-tar pharmaceutical specialties owned by the Bayer Company—*aspirin*, *phenacetin*, etc.

#### THE USE OF NATURAL DYESTUFFS.

The combined efforts of these works will unquestionably do much to mitigate the difficulties inevitable upon a cessation of a supply of German dyes. Still, at the best, they can replace for the next few months, or even for a year, only a relatively small quantity of the lacking colors.

This fact has been quickly recognized by large consumers of dyestuffs and by the group of firms devoted to the production of dyewood extracts. The latter are making ample preparations for meeting heavy demands during the coming months. The four establishments extracting American quercitron are in a position to expand their output rapidly. The supply of cutch seems to be fairly adequate. Largely increased amounts of logwood, fustic and Brazil wood have been ordered from the West Indies and southern countries. Some difficulty is encountered in obtaining sufficient freight accommodation. Prices have risen on account of higher freights, lack of practiced woodchoppers, the temporary interruption in the export of logwood from Mexico and the enormously increased demand for dyewoods from Great Britain to meet the dyestuff famine now threatening British textile interests.

The demand for natural dyestuffs by American mills has already set in. One large dyewood establishment has increased its sales by 25 percent during the last few months. Another reports that the current orders for logwood extract are 50 percent greater than during last autumn, orders for quercitron, fustic and cutch have tripled, and those for hypermic (*brazilwood*, etc.) have doubled.

## ESTIMATION OF SUGAR IN URINE BY BANG'S METHOD.\*

---

WM. GRAY, PH. G.

---

Bang's solution, for the quantitative determination of sugar in urine, introduced to medical and chemical literature about six years ago, has been well received by physicians and analysts in Chicago, and its use as a delicate and very accurate reagent is spreading.

## PREPARATION OF BANG'S SOLUTION.

First prepare a concentrated solution of copper sulphate in distilled water, using 250 grams in 1500 cc. of water. The copper sulphate should be chemically pure and contain 5 molecules of water. The amount of copper present should be determined by electrolysis. After the determination of the exact amount of copper in the solution, a calculation should be made as to the number of cc. of solution containing 25 grams of copper sulphate. The number of cc. may be more or less than 150, according to the copper sulphate employed. Let us say, for example, that it takes 154.2 cc. instead of 150 cc. You may now place a label on the stock bottle reading, 154.2 cc. equals 25 grams  $\text{CuSO}_4 + 5\text{H}_2\text{O}$ .

You are now ready to make the two solutions employed in the reagent.

*Solution No. 1.*—Weigh accurately into a beaker 500 grams potassium carbonate, 400 grams potassium sulphocyanate, 100 grams potassium bicarbonate and dissolve in 1200 cc. of distilled water at 60° C. The salts should be chemically pure. When dissolved, place in a 2 liter volumetric flask, reduce temperature to 30° C. and run in, slowly, by means of a burette, 154.2 cc. of the concentrated copper solution, shaking the mixture while the copper is being added. This is very necessary to prevent precipitation. Finally add enough distilled water to make 2 liters.

*Solution No. 2.*—Dissolve 200 grams potassium sulphocyanate and 6.55 grams hydroxylamine sulphate in distilled water at ordinary temperature to make 2 liters of solution.

Allow both solutions to stand over night, then titrate solution No. 2 against No. 1 and balance so that 50 cc. of No. 2 will exactly decolorize 50 cc. of No. 1.

The operation of this reagent is dependent upon the well-known reducing powers of sugar, as found in urine, and of hydroxylamine. When urine containing sugar is added to the alkaline copper solution, the sugar reduces the blue cupric salt to the yellowish cuprous salt, the amount of cupric salt so reduced depending upon the amount of sugar present. The amount of unreduced cupric salt present is then determined by the amount of hydroxylamine solution necessary to complete the entire reduction.

## THE APPLICATION OF THE TEST.

1. Measure accurately 10 cc. of urine into a 200 cc. Jena flask.
2. Add to the urine exactly 50 cc. of solution No. 1 (blue copper solution).
3. Heat this flask on a wire gauze over a Bunsen flame so regulated that the flame turns a small spot of the gauze red. Protect flame from air currents.
4. After boiling commences, allow to boil for exactly three minutes.

\* Read before Chicago Branch, April 27, 1915.

*Caution*—If the urine contains more than 0.6 percent of sugar, the blue color will be entirely destroyed. If the blue color turns yellowish on boiling, a smaller amount of urine must be used. Take 2 or 5 cc. of urine diluted with water to 10 cc. and repeat the operations this far.

5. Cool flask and contents to room temperature, quickly, by immersing the flask in cold water.

6. Titrate the contents of the flask with No. 2 solution (hydroxylamine solution) until the blue color is exactly decolorized. This titration should be so conducted that the solution runs from the burette rapidly, but in drops.

7. From the number of cc. of No. 2 solution used, calculate, from the appended table, the sugar in milligrams in the amount of urine used.

BANG'S TABLE OF REDUCTION EQUIVALENTS.

Cc. hydroxylamine solution used	Mg. sugar represented	Cc. hydroxylamine solution used	Mg. sugar represented	Cc. hydroxylamine solution used	Mg. sugar represented	Cc. hydroxylamine solution used	Mg. sugar represented

## PUSHING BEYOND THE HALF-WAY MARK AND WHAT AM I DOING?

ALFRED W. PAULEY, ST. LOUIS, MO.

Chief among the characteristics that carry men past the half-way mark on the road to success is eagerness to keep on learning more about business methods and principles. The ablest men are constant students. They agree with the statement recently made by the treasurer of a large steel corporation: "I have been in business for about thirty years and if my business experience has taught me one thing, it is this: *That the more a man knows about business principles*

*and methods the more he is worth to himself, to his employer, and to his business associates.'"*

#### WHAT AM I DOING?

Any pharmacist can look around in his own line and see prizes only a little distance ahead of him and he can likewise see plenty of pitfalls if he is watchful. To win the prizes and avoid the pitfalls, a man must act under the guidance of sound business principle. A progressive pharmacist should ask himself this question: "What am I doing day by day, week by week, or year by year, to build up my personal assets, my business knowledge and my producing ability? Am I directing my personal career with as much intelligence and foresight as a capable business manager shows in directing the affairs of his concern?"

Retail merchandising and methods employed to accomplish specific results have been problems ever since the beginning of time. The dealers in the time of Nero were as much concerned about retail merchandising as we are to-day and before the Civil War, they likewise had problems to solve similar to those of present date. Yet it seems as though competition was not as keen as it is to-day and in consequence, we are obliged to give this matter more attention from a scientific standpoint than our ancestors did. In consequence we look to the experienced business man for advice. As we look to the experienced business man for advice, so do the prospective customers of retail drug stores depend largely upon the suggestion of your show-windows and show-cases; therefore it is essential that in connection with salesmanship and advertising, we consider show-case and show-window displays. Salesmanship and advertising are so closely allied that it is almost impossible for us to consider one of these subjects without the other. Advertising is salesmanship plus publicity, while salesmanship is advertising plus getting the order. If it is true that salesmanship and advertising are so closely allied that we must consider them jointly, then we must likewise consider the silent factors, namely, the window and show-cases.

Before we go into this matter any further, let us consider the elements of a sale, and the steps to a sale.

Elements of a sale	{	Salesman
	{	The Article or Merchandise
	{	The Purchaser

Steps to a sale	{	Secure Attention
	{	Inspire Confidence
	{	Create a Desire

From the foregoing remarks we plainly see that there is a direct relation between the salesman and the silent salesman. Therefore we should consider the silent salesman, namely, the show-window and the show-case, very important factors and in connection with these factors there are such things as decorating, illuminating, special displays, backgrounds and signs to be considered. The show-windows and show-cases really act as suggestions and work in with your general line of advertising, and therefore your windows should be made up so as to back up your newspaper or circular advertising. You may advertise in the very best way, without the desired results, and take that same medium and sup-

plement it by a window display, and a show-case display, and get far better results, as we all know that we are dealing mainly with the human mind through the medium of suggestion. Suggestion is found in its simplest form in the association of words. The name *Ingersoll* suggests a watch, *Colgate* suggests soap, *Ford* suggests motor car, because by long familiarity with these combinations we have come to think of one part in connection with the other, and it is almost impossible to separate them. It may be noted in passing that the particular word suggests the general but that the general does not always suggest the particular individual. Watch does not necessarily suggest *Ingersoll* nor motor car, *Ford*. All words, however, have their associations. We take common maxims and repeat the first part of it and the mind implies the rest. "All's well,"—"It is an ill wind,"—"Early to bed, early to rise," and so forth. In a novel it is no longer necessary to put at the end "they are married and lived happy afterwards." All we need is the slightest term in the direction of an engagement; not even the spoken "yes"; so with many jokes, the listener fills in the ending from his experience. Suggestion is often used in advertising in similar ways and particularly is this true of show-window and show-case suggestion, it being directly allied with salesmanship and advertising, becoming inseparable for perfect results. Your windows first of all being silent salesmen should be so utilized to bring you fair returns and should be used with the same intent that you have in mind when writing your advertisement; namely, to attract attention, inspire confidence and create desire, which leads on to the sale. Your results will be in proportion to the attractiveness of your display. This does not necessarily mean that you must spend a great amount of money to put in fancy displays, for a display may be made attractive by arranging the merchandise so as to appeal to the customer, and the customer once attracted into your store, may add materially to your sales, provided proper salesmanship is exercised. You therefore must direct your attention to the method of decorating and arranging your merchandise in a tasty and attractive manner, giving due consideration to color harmony. Every pharmacist should have a general knowledge of the principal colors used in decorating and apply the rules of harmony and contrast, their formation and influence upon the eye. Psychological experiments prove that red is a color which attracts best. When we look upon a painting, red is a color which we see first. As we look along the railroad yards at night, how plain the red lights up above the signals are; red, therefore, is one of the essential colors in making attractive displays. Red and green harmonize well; yellow and green likewise; yellow alone is a pretty color; orange contrasts with black; purple looks rich with gold; green harmonizes with yellow; pink is a good summer color; blue is a very soothing color; gold contrasts with any dark color; while black is very heavy and alone does not make up well; while white is always appropriate and can be combined with practically any color and harmonize.

#### LIGHTING.

The show-windows properly illuminated will add materially to the attractiveness of your display; money spent for proper illumination is well spent. Arrange your lights in your show-windows so as to avoid shadows.

## BACKGROUNDS.

With your windows enclosed, it will not be necessary to build special backgrounds, provided they are made of attractive material. Otherwise they should be decorated with a background similar to that which should be used in open windows. Special displays should be made from time to time which you should plan before you trim your windows, and considerable thought given to same in order that special displays may serve as special attractions: Easter displays with chickens and rabbits; Fourth of July displays; Thanksgiving displays; Washington's Birthday displays all serve as good advertising mediums, using in connection merchandise that is seasonable.

## SIGNS.

Signs are absolutely necessary for every window display as a show-window without a sign is like bread without butter. All window displays should have this silent salesman talk; prominently displayed in the way of a sign. Window strips are exceptionally good for bringing out special features in connection with the soda fountain, cigars and sundry items.

## INTERIOR DISPLAY.

Interior display of both show-case as well as general decorations is usually neglected by the average druggist and these features should have careful consideration as the attractiveness of the store depends largely upon the manner in which the interior is decorated. While the main interior decoration should consist of well arranged show cases, yet displays on your show-cases add materially to the attractiveness of your displays, giving it this "merchandisey" effect that a commercial drug store of to-day is endeavoring to have. Then let us repeat what we have already said in just a few words: Advertising supplements salesmanship; show-window displays supplement advertising; show-case displays supplement show-window displays.

---

NOTE ON THE USE OF COLLOIDAL IRON IN THE DETERMINATION OF LACTOSE IN MILK.\*

---

REUBEN L. HILL.

(From the Department of Physiology and Biochemistry, Cornell University Medical College, Ithaca.)

---

The method described below has the advantage of being within the reach of the ordinary laboratory student; it requires comparatively little time and gives very accurate results.

In clarifying the milk, a 10 per cent solution of colloidal iron (dialyzed ferric hydroxide) is used. By adding the proper amount of colloidal iron, all the proteins of the milk are completely precipitated and can be rapidly filtered off leaving a perfectly clear colorless filtrate.

---

\* Journal of Biological Chemistry, March, 1915, 175.

The method is as follows: To a 10 gram sample of milk, which has been diluted to about 25 cc., about 3 cc. of a 10 percent solution of colloidal iron are added. The amount of colloidal iron necessary depends upon the composition of the milk and can be accurately determined by adding the last portion drop by drop, and agitating after each addition.

If the precipitation is complete, a clear supernatant liquid separates out from the flocculent precipitate; if too little has been added, the supernatant liquid will appear milky; if too much, it will have a reddish tinge.

The sample is next filtered into a 100 cc. volumetric flask, and the precipitate thoroughly washed with distilled water until the filtrate and washings aggregate about 100 cc. The flask is then filled to the mark and the percentage of lactose determined by Benedict's quantitative method.<sup>1</sup> About 16 cc. of the diluted sample will be required to reduce completely 25 cc. of Benedict's quantitative solution.

A very convenient method of analysis is given by Cole,<sup>2</sup> in which a 4 ounce flask is used instead of an evaporating dish. The wide mouthed Jena 150 cc. flat bottomed flasks are very convenient for the determination. The flask is fitted into the 2.5 inch ring of a retort stand, and the height above the Bunsen burner so arranged that the contents of the flask will be kept briskly boiling with a small flame. Two flasks can be run simultaneously from the same stand.

Three to four grams of anhydrous sodium carbonate are dissolved, by means of heat, in 25 cc. of *twice diluted*<sup>3</sup> Benedict's solution, to which a little powdered pumice has been added. About 14 cc. of the sugar solution are then rapidly added from a burette. Boiling is continued for at least one-half minute before the addition of more lactose solution.

When reduction is complete the supernatant liquid will have a slight yellowish tinge to which the blue color very slowly returns. If the end-point has been underestimated, it will have a blue or greenish tinge that rapidly becomes bluer. With a little practice, and by adding the last portion a drop at a time, and boiling one-half minute after each addition, the end-point can be determined to within one drop.

Twenty-five cc. of Benedict's quantitative solution are completely reduced by 0.0676 of a gram of anhydrous lactose. Since the milk has been ten-fold diluted, 0.0676 divided by the number of cc. of diluted lactose solution used, multiplied by ten, will give the percentage of lactose in the milk. If 16.1 cc. of lactose solution were required, then  $16.1 : 0.0676 :: X : 10 = 4.20$  percent.

That very accurate results can be obtained by using this method may be seen from the following tables. Table I shows the comparison between duplicate samples of different milks. Table II shows the effect of the addition of the small quantities of lactose to the milk before analysis.

<sup>1</sup> S. R. Benedict, Jour. Am. Med. Assn., lvii, p. 1193, 1911. P. B. Hawk: Practical Physiological Chemistry, 4th edition, Philadelphia, 1912, p. 386.

<sup>2</sup> S. W. Cole: Practical Physiological Chemistry, St. Louis, 1914, p. 53.

<sup>3</sup> I prefer to dilute 25 cc. of Benedict's solution to at least 50 cc., for I obtain a more accurate end-point with dilute than with concentrated solutions.

TABLE I.

Comparison between duplicate samples of different milks.

Sample No.	Anhydrous Lactose in Milk 1 Percent	Lactose in Milk 2 Percent	Lactose in Milk 3 Percent
1	4.08	4.19	4.23
2	4.11	4.20	4.20
3	4.10	4.20	4.22

TABLE II.

Effect of the addition of lactose to 10 cc. samples of milk.

Sample No.	Sample ten times diluted, required to reduce 25 cc. of Benedict's Quantitative Solution. cc.	Anhydrous Lactose in Sample gm.	Anhydrous Lactose Added gm.	Added Lactose Recovered Percent
Milk 4				
1	16.7	0.405	None	
2	14.9	0.454	0.050	98

## A FOLDING PAPER DEMONSTRATING CASE FOR BACTERIAL CULTURES—A PAPER INSET ANIMAL NECROPSY TRAY.

M. R. SMIRNOW, M. D., NEW HAVEN, CONN., IN JOURNAL A. M. A.

A bacteriologist frequently finds occasion to demonstrate cultures of micro-organisms, either to student classes within or near the laboratory or at meetings at some distance. In such circumstances it would be desirable to have not only some light and compact receptacle for such cultures, but also one in which the cultures could be shown to the best advantage.

It was for just such an occasion that, in looking about for a proper demonstrating case, I finally invented the form of folding paper display case shown in Fig. 1.

This case is easily made by using a No. 160 white card paper. The design is mapped out, cut and creased, as indicated in Fig. 2. The holes are punched out with a  $\frac{5}{8}$ -inch die. The case is then folded, fastened and put away until it is to be used. When the cultures to be demonstrated are ready they are placed in proper order into the case, and any description desired may be written directly on the face of the case at both its upper and lower margins. All dimensions except

the length are constant for any size display case desired, the length varying with the number of tubes the case is to hold, requiring  $1\frac{1}{4}$  inches for each tube. The height of the case is  $6\frac{1}{4}$  inches and will hold the regulation size culture tube, the cotton plugs of which are best cut down to the mouths of the tubes and sealed with paraffin.

At several meetings where the demonstration of the cultural characteristics of bacteria was desired, I have used a number of these cases of various sizes with excellent success. The advantages of this paper demonstrating case are:

1. It is of light weight, is easily constructed, and is excellently suited to demonstrating purposes.
2. It takes up little room and may be conveyed any distance, packed in a hand bag or suit case.
3. The culture tubes are separated from one another and cannot be broken.

#### PAPER TRAY.

This necropsy tray is intended as a convenient piece of apparatus for laboratories in which a considerable number of animal necropsies are conducted. It is designed especially with a view of permitting the least amount of handling of the animal. Its oiled paper inset affords no opportunity for the spread of blood or other fluids, and acts as a wrapping material for the remains that are to be destroyed.

The tray proper is constructed of a single piece of sheet galvanized tin and measures 20 by 9 by  $1\frac{1}{2}$  inches for rabbits and 9 by 6 by  $1\frac{1}{2}$  inches for guinea pigs. The corners of the tray should be finished off by making small flaps from the ends onto the sides, riveting them in place, and soldering the seams on the inside. A double leg holder made of flat spring brass about three quarters the length of one of the ends and five-eighths inch wide is riveted to one end. The brass is made rough on the inner surface to increase its gripping power. This end of the tray is made a full quarter-inch lower than the other end or the sides of the tray in order to permit the side clamps to "ride" on the sides of the tray. The sides are somewhat lipped or flattened on their tops, measuring one-quarter inch in width. At the end farthest from the leg holder is soldered a corrugated strip of galvanized tin, about six inches in length and one-quarter inch wide, fitting exactly over this lipped surface. These corrugations, together with a spring brass clamp, are to act as leg holders for the forelegs of the animal, automatically adjusting themselves to any size animal.

This clamp is constructed of spring brass. It is made in the manner illustrated and fits loosely over the lipped edge of the side of the tray. The square portion of the clamp must be heated to permit bending, as spring brass cracks and breaks instead of bending at acute angles. The end of the clamp is so constructed that it will allow free play in its movement over the corrugations except when there is some pressure underneath the curved portions of the clamp, at which time it should catch and hold firmly.

The paper inset is best made of No. 160 oiled paper, cut to size and folded to fit the tray. All its sides are folded  $1\frac{1}{2}$  inches from the edge of the paper, and the corners turned to one side or the other.

The tray is simple in construction, costs very little and can be used indefinitely,

as there is nothing that requires special attention. The only things that might possibly need replacing are the brass clamps, which can be turned out by any laboratory technician. The paper insets can be folded by hand or can be supplied in quantities at little cost by some paper box manufacturer.

Though from a sanitary standpoint no special advantage can be claimed for this tray over the ordinary piece of board, newspaper and nails, always used in bacteriologic laboratories, yet the tray described acts as a much better piece of apparatus for purposes of demonstration, and adds to the general neatness in laboratory technic.

Fig. 1.—Folding paper demonstrating case for bacterial cultures

Fig. 3.—Paper inset animal necropsy tray

Fig. 2.—Plan of demonstrating case. A 160 pound white bristol cardboard is used. The design is mapped out according to the dimensions indicated. The cardboard is cut on all solid lines except slits marked *A*, *B*, *C* and *D*, *a*, *b*, *c*, *d*, *e* and *f*, which are to be done later. All dotted lines are creased with some blunt instrument, the cut board being placed over soft wood. As many apertures as are desired are punched out, 1 1/4 inches for each being allowed. All creased lines are bent forward except *a*, *b*, *c*, *d*, *e* and *f*, which are to be bent backward, and are folded as in illustration. The flaps *A*, *B* and *C*, *D* should overlap; slits are to be cut in opposite direction, as indicated, so that they will properly lock. With a sharp instrument are cut small slits 1 and 2, which will go through three thicknesses of paper that make up the back of the case, and by which the whole is fastened with ordinary paper fasteners.

CURRENT REVIEW OF PHARMACEUTICAL JOURNALS FOR  
MARCH, 1915.\*

---

E. FULLERTON COOK, P. D.

---

In this review, with only one or two exceptions, original articles have been abstracted.

A number of papers not referred to, dealing with scientific subjects, are printed this month, but the majority of such papers are reprinted from the Journal of the A. Ph. A. or taken from other Association proceedings.

Much attention is given this month in the American journals to discussion and explanation of the Harrison Act. The Stevens Bill, which is expected to control the "cut rate" evil also occupies attention editorially and in discussion.

In most journals a large share of space is devoted to commercial questions. Papers on salesmanship, accounting, collecting bills, system, buying, etc., etc., are predominant, and the soda fountain and its needs are also given an important place.

The journals in this respect reflect the condition of the drug business at large and this is not altogether a cause for discouragement since business methods must be improved in many stores if they would continue to exist, and we are all seeing at least a few stores where the best professional ideals are maintained and made a financial success through the application of sane and efficient business principles.

The following abstracts were selected as of sufficient interest to report:

## AMERICAN DRUGGIST AND PHARMACEUTICAL RECORD.

*Toilet Preparations* (Page 98).—F. T. Gordon starts a series of articles on this subject, the paper in this issue being devoted chiefly to a general consideration with advice to the would-be manufacturer.

## PRACTICAL DRUGGIST.

*The Cultivation of Medicinal Plants*.—By Fred B. Kilmer (P. 20). This is the first of a series of articles on this subject, which is of rapidly increasing importance. Dr. Kilmer reviews the work of the U. S. Department of Agriculture in this field, through the Bureau of Plant Industry, and also tells of the much more extensive development of drug cultivation in Europe. A few American manufacturers have been studying these problems and growing some drugs on a commercial scale, and he predicts that if manufacturers of medicinal products are really interested in getting better drugs, they can do so through systematic, scientific investigation and experimental cultivation, but this in some instances may require years of work.

## THE AMERICAN PERFUMER.

This journal is running several interesting articles in serial form. The titles are *How Flower Concretes are Made*, *The Soap-Making Industry*, by Dr. E. G. Thomssen, and *Vanilla Beans*, by Wallace Mawhey. While these may not be of especial value to retail druggists they are a valuable addition to the literature on these subjects.

## THE WESTERN DRUGGIST.

Several excellent articles on the business side of pharmacy are found in this issue. *Letters that will collect your accounts* (Page 75) is the title of one. In this article five form letters

---

\* Read before Philadelphia Branch, April 13.

are given and suggestions for using them. *The making of a 100 Point Salesman* (Page 77) is also an article which will be of interest to many.

#### MERCK'S REPORT.

*Perfumery and the Chemist*, by Edward T. Beiser (Page 81). A short review, in popular style, of the development of synthetic chemistry in the field of perfumery. Many of the more common artificial perfumery materials are mentioned and their chemistry and method of production briefly outlined.

#### BULLETIN OF PHARMACY.

(Page 110.)—A symposium on *The best way to secure a mailing list* occupied an important place in this month's issue. The giving of a small prize, such as a calendar, pencil, etc., on the return of a coupon or card which has been mailed or distributed in the district seems to be the favorite method of obtaining a valuable mailing list.

#### DRUGGISTS' CIRCULAR.

(Page 153.)—The subject of *Toilet Cream manufacture* is discussed by H. C. Bradford and working formulas published for "Theatrical" "Make-Up," "Oxygenated," and "Cocoa Butter" Cold Creams, also for "Satin Cream" and Cucumber Cream and Jelly.

The formula for "Satin Cream" is unusual and may be of value to the members. It is:

Pure, sweet unsalted lard.....	220 gm.
Potassium hydroxide .....	31 gm.
Alcohol, 60 percent.....	10 gm.
Water .....	90 gm.

Dissolve the KOH in the water, pour off the clear liquid and mix it with the lard in a warm pan. Finally work in the alcohol in portions. The fat is largely saponified and the product is used chiefly for the removal of soot, dust, travel stains, etc., by being applied freely and then wiped off with a cloth.

(Page 201.)—Here will be found an interesting article on the *Drug Store Library*, by Frank Farrington. Emphasis is especially laid upon the necessity of having a good business library, books on advertising, window trimming, salesmanship, management, origin and manufacture of goods, etc. He advises proprietors to subscribe to a good trade paper for their clerks, having it sent to their homes.

(Page 203.)—Mr. M. P. Gould discusses the possibilities of advertising for a retail druggist, he pointing out the conditions under which each form of advertising may best be used.

#### THE PHARMACEUTICAL ERA.

(Page 97.)—Editorially the Era reviews the purposes, scope, and provisions of the Harrison Anti-narcotic Law, stating that in its application to the drug trade it is the "most important legislation ever enacted in this country."

(Pages 101 to 113.)—The "Act" and all regulations to date, issued by the Department are copied in full. An extended list is also given of official and proprietary preparations containing Opium or Coca or their derivatives which are affected by the Law.

#### AMERICAN JOURNAL OF PHARMACY.

*The Proper Time to Collect Sanguinaria* (Page 97).—O. A. Farwell of Parke, Davis & Co. made a number of examinations of *Sanguinaria* collected at different seasons of the year and confirmed the conclusions of Drs. Homerberg and Beringer, published several years ago, in which they stated that the rhizome was richest in alkaloid "immediately after flowering" and not "after the death of the foliage," the time for collection specified in the Pharmacopœia.

#### THE PACIFIC PHARMACEUT.

An abstract from the Consular Report calls attention to the many recent new uses for Infusorial Earth. These consist in its use as an absorbent for nitro glycerin in the making of dynamite, also as a non conductor of heat in pipe coverings and fire-proof buildings, as an absorbent for liquid manures for the production of artificial fertilizers and, when boiled with shellac, as a suitable material for talking machine records.

## N. A. R. D. JOURNAL.

*The Cultivation of Medicinal Plants* (Pages 1111, 1165 and 1218) is considered by taking up individual drugs and compiling the available information from Government Bulletins and from published articles and books by those who have been studying and experimenting on this subject.

*The Weekly Legislative News-Letters*, by J. Leyden White, are always interesting and of much assistance to pharmacists in keeping in touch with National legislative programmes and also in understanding the purpose and scope of proposed new laws.

## PHARMACEUTICAL JOURNAL OF ENGLAND.

*The Chemical Industries of Germany*.—By Prof. Percy Frankland (Page 353). The tremendous importance of the chemical industries of Germany is pointed out, figures being given to show production in recent years. For instance, 11,000,000 tons of crude potash salts was marketed in 1912, valued at about \$44,000,000.

The statement is also made that it is believed Germany is now independent in respect to nitrate supply, since she has perfected a process whereby Ammonia is produced from hydrogen and atmospheric nitrogen under a pressure of 200 atmospheres and at 500° C. in the presence of a catalyst. The Ammonia is then converted into Nitric Acid by burning it in air in the presence of a catalyst.

Other figures are given to show the importance of the production of explosives, artificial silk (valued at \$15,000,000 in 1912), synthetic organic chemicals, including dye-stuffs, etc.

## REPORT OF COMMITTEE ON UNOFFICIAL STANDARDS.

The following portion of the report of the Committee on Unofficial Standards relates to certain crude drugs and chemicals suggested for inclusion in the next revision of the National Formulary, and by order of the Council is published in the Journal in order to afford opportunity for discussion before the standards proposed are finally adopted.

Manufacturers, importers, analysts, and others interested in any of the proposed standards, are requested to send their criticisms and comments to the chairman of the committee, George M. Beringer, 501 Federal St., Camden, N. J.

(Continued from May Issue)

## CHIRATA.

## Chirata

1. The dried plant of *Swertia Chirayita* (Roxburgh) Hamilton (Fam. *Gentianaceae*).

2. Smooth; root simple, about 7 mm. thick near the crown, stem about 1 m. long, externally yellowish or purplish-brown; cylindrical near the base, quadrangular and slightly winged above, with numerous opposite, ascending branches; wood yellowish, thin, enclosing usually a large yellowish easily separable pith; leaves opposite, sessile, ovate-lanceolate, entire, five-nerved, about 6 cm. long; flowers numerous, paniced, small, with a four-lobed calyx and corolla, capsule ovoid, acute, one-celled, many-seeded; odor slight; taste intensely bitter

3. *Average dose*.—1 gm. (15 grains).

## CONDURANGO.

## Condurango.

1. The dried bark of *Marsdenia Condurango* Reichenbach filius (Fam. *Asclepiadaceae*).

2. In single quills or transversely curved pieces, usually from 4 to 13.5 cm. in length; bark 1 to 6 mm. in thickness; outer surface light grayish-brown to dark brown, nearly smooth and with numerous lenticels, or more or less scaly and considerably roughened, the scales soft, occasionally with brownish-black apothecia of a fungus; inner surface grayish-white or light brown, longitudinally striate; fracture short and granular or short-fibrous; odor slightly aromatic, especially marked in the fresh drug; taste bitter and aromatic.

3. Under the microscope sections of Con-

durango show a corky layer consisting of several rows of thin-walled cells, frequently with yellowish-brown contents; a layer of phelloderm of 8 to 10 rows of cells, containing either starch grains or membrane crystals of calcium oxalate, the latter in prisms, 0.010 to 0.035 mm. in length; a primary cortex of collenchyma containing chloroplasts, starch grains, or rosette aggregates of calcium oxalate, 0.015 to 0.040 mm. in diameter; a pericycle or pericambium of tangentially elongated parenchyma cells, with groups of bast-fibers and laticiferous vessels in an interrupted circle; middle bark with large groups of stone cells varying from nearly isodiametric to elongated, sometimes very irregular in form; inner bark with medullary rays 1 to 2 cells wide, numerous laticiferous cells accompanied by small groups of sieve cells, parenchyma containing either starch grains or rosette aggregates of calcium oxalate, and an occasional isolated bast-fiber or small group of stone cells.

4. *Powder*—Light, yellowish-brown; consisting chiefly of fragments of stone cells and parenchyma containing calcium oxalate crystals and starch grains; stone cells chiefly in large groups, the individual cells being more or less irregular in shape and with very thick porous walls, the lumina being usually filled with air; calcium oxalate chiefly in rosette aggregates, occasionally in single prisms, mostly from 0.015 to 0.020 mm. in diameter; starch grains mostly single, frequently 2- to 4-compound, the individual grains being from 0.003 to 0.015 mm. in diameter; bast-fibers non-lignified; very long and from 0.010 to 0.035 mm. in width; fragments of thin-walled latex tubes from 0.015 to 0.025 mm. in diameter and filled with a granular substance; fragments of cork grayish or light yellowish brown.

5. *Macerate* 1 gm. of the powdered bark in 5 cc. of cold water; filter and heat the filtrate in a test tube, it should become very cloudy, but on cooling assumes its original transparency.

6. The yield of ash should not exceed 12 percent.

#### CONIUM.

##### Conium

1. The full grown, but unripe fruit of *Conium maculatum* Linne (Fam. *Umbelliferae*), carefully dried and preserved, and yielding, when assayed by the process given below, not less than 0.5 percent of conium. After being

kept for more than two years, Conium is unfit for use.

2. Broadly ovoid, greenish-gray, the two carpels of most of the fruits separated, each about 3 mm. long and about 1.5 mm. in diameter, ovoid, somewhat curved, the inner, flattened side marked by a deep longitudinal groove, the outer, convex side, with five pale yellow, somewhat crenate ribs, the intervening surfaces wrinkled but otherwise smooth; pericarp without oil-tubes; odor slight, but when triturated with a solution of potassium hydroxide, strong, disagreeable, and mouse-like; taste characteristic, disagreeable, afterwards somewhat acid.

#### ASSAY OF CONIUM.

3. Conium, in No. 40 powder, fifteen grammes ..... 15 gm.  
Solution of Sodium Hydroxide,  
fifteen cubic centimeters.... 15 cc.  
Purified Petroleum Benzin.  
Normal Hydrochloric Acid Volumetric  
Solution.  
Sodium Carbonate Test Solution.  
Tenth-Normal Sulphuric Acid Volumetric  
Solution.  
Fiftieth-Normal Potassium Hydroxide  
Volumetric Solution.

Cochineal T. S. each, a sufficient quantity.

Place the Conium in a 250 cc. Erlenmeyer flask, add 150 cubic centimeters of purified petroleum benzin and then 15 cubic centimeters of solution of sodium hydroxide, insert the stopper securely, and shake the flask vigorously at frequent intervals during six hours. Allow the solution to separate and decant 100 cubic centimeters of the clear benzin solution (representing 10 gm. of the drug) into a separator; shake this out with successive portions of 20 cc., 10 cc., 5 cc. and 5 cc. of normal hydrochloric acid V. S. If a few drops of this last washing gives an alkaloidal reaction with iodine T. S., continue the shaking out with successive portions of 5 cc. each of normal hydrochloric acid V. S. until the alkaloid is all extracted. Collect the acid washing and concentrate by evaporation on a water-bath to 10 cubic centimeters, cool and transfer the liquid to a separator, then add sodium carbonate T. S. in excess. Extract the alkaloid by shaking out with successive portions of 15 cc. each of purified petroleum benzin. Separate the benzin washings and filter into a beaker. Then add exactly 10 cubic centimeters of tenth-normal sulphuric

acid V. S. and stir thoroughly for two minutes so as to mix the acid and benzin solution. Evaporate the benzin layer in a current of warm air, at a temperature not exceeding 60° C. and as soon as the benzin has disappeared, cool, add 5 drops of cochineal T. S. and titrate the acid solution with fiftieth normal potassium hydroxide. Calculate the amount of coniine neutralized by the acid by using the factor 0.0126 and multiply the result by ten to obtain the percentage of coniine in the drug.

4. *Average dose*.—0.200 gm (3 grains).

### CONVALLARIA.

Convallaria.

Lily-of-the-Valley Roots.

1. The dried rhizome and roots of *Convallaria majalis* Linné (Fam. *Liliaceae*).

2. Rhizome horizontal, elongated, usually branched, cylindrical, variable in length, 1 to 3 mm. in diameter; externally yellowish-white or pale brown, with a few circular stem scars, and from the under and side portions at the nodes usually arise from 3 to 5 thin, tortuous, dark brown, branching roots; fracture short or fibrous; internally whitish; odor faint; taste sweetish, becoming bitter and acrid.

3. Under the microscope sections of the rhizome of *Convallaria* show an epidermal layer with a thick outer layer of cutin; a hypodermal layer of a single row of collenchyma; a cortex made up of about 20 rows of parenchyma cells, some of which contain starch and raphides of calcium oxalate; a prominent endodermis, the radial and inner walls of which are strongly thickened and lignified; inside the endodermis is an interrupted circle of collateral fibro-vascular bundles, the woody portion of which has in cross section the shape of the letter "V"; inside the circle of bundles is another interrupted circle of fibro-vascular bundles of the concentric type, the sieve tissue being surrounded by the xylem; the parenchyma cells of the pith separated by large intercellular spaces.

4. Under the microscope, transverse sections of the root of *Convallaria* show a hairy epidermal layer, a hypodermis of a single row of cells; a cortex of about 6 rows of cells, some of which contain starch, raphides and oil; the cells of the endodermal layer resemble those of the rhizome; fibro-vascular bundles mostly 5.

5. *Powder*.—Dark brown; tending to cake on standing; consisting chiefly of cellular

fragments and a few starch grains and raphides of calcium oxalate; cells of endodermis with slightly oblique ends and considerably thickened walls, lignified porous walls, fragments of tracheæ with spiral and scalariform thickenings, or with porous walls; starch grains single or compound, mostly nearly spherical, and from 0.003 to 0.012 mm. in diameter; raphides of calcium oxalate few, from 0.020 to 0.045 mm. in length.

### CROCUS.

Saffron.

1. The stigmas of *Crocus sativus* Linné (Fam. *Iridaceae*), without admixture of more than 10 percent of the yellow styles and other harmless impurities. Saffron should be kept in tightly-closed containers and protected from the light.

2. Stigmas separate or three attached to the summit of the style; stigmas usually about 25 mm. in length, cornucopia-shaped, of a dark rich red color, the margin dentate or fimbriate; styles about 10 mm. in length, more or less cylindrical, solid, yellowish; odor strong, peculiarly aromatic; taste bitterish, aromatic. When chewed it colors the saliva orange-yellow.

3. Under the microscope the upper end of the stigma shows numerous cylindrical papillæ about 0.0150 mm. in length, among which should occur a few spherical pollen grains, the latter being nearly smooth, and from 0.040 to 0.075 mm. in diameter; occasionally some of the pollen grains have germinated and show pollen tubes.

4. When placed in sulphuric acid, the stigmas should be immediately colored blue, gradually changing to violet, and finally become a deep wine-red color.

5. Add 0.010 gm. of finely powdered Saffron to 100 cc. of cold water, allow it to macerate for several hours and filter; upon adding 10 cc. of this filtrate to 100 cc. of water, it should give a distinct, yellow-colored solution.

6. Macerate 0.010 gm. of Saffron in 5 cc. of methyl alcohol; a deep orange color should be imparted to the liquid. Macerate 0.010 gm. of Saffron in 5 cc. of acetone, alcohol, or absolute alcohol; a distinct, lemon-yellow color should be produced. With corresponding quantities of Saffron and ether a very light lemon-yellow color should be produced. With corresponding quantities of Saffron and chloroform a very slight, yellow tinge should be imparted; and with corresponding por-

tions of Saffron and xylene, benzene, carbon disulphide and carbon tetrachloride, the solvents should remain colorless.

7. When pressed between filter paper, Saffron should not display transparent spots due to the absorption of oil.

8. Saffron should not lose more than 14 percent of its weight when dried at 100° C.

9. The yield of ash should not exceed 7.5 percent, and the ash should not be fusible.

#### CUPRI SULPHAS.

Cupric Sulphate. Copper Sulphate.

1. It should contain not less than 63.61, nor more than 66.79 percent of anhydrous copper sulphate, corresponding to not less than 99.5 percent of the hydrated salt,  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O} = 249.72$ . It should be kept in well-stoppered bottles.

2. Copper Sulphate occurs as large, transparent, deep blue, triclinic crystals; odorless, of a nauseous metallic taste; slowly efflorescent in dry air.

3. It is freely soluble in cold and very soluble in hot water; it is slightly soluble in alcohol and freely soluble in glycerin.

4. When heated to 30° C. the salt loses part of its water of hydration and is converted into a pale blue, amorphous powder. More water is lost at 100° C. and finally at 200° C. a white, anhydrous powder remains. At a still higher temperature, sulphur dioxide and oxygen are given off, and a residue of black cupric oxide is left.

5. An aqueous solution (1 in 20) has a blue color, and shows an acid reaction with litmus.

6. On placing a drop of an aqueous solution of the salt (1 in 20) on a bright piece of iron, a red film of metallic copper will be deposited.

7. Barium chloride T. S. produces in an aqueous solution (1 in 10) a white precipitate, insoluble in hydrochloric acid.

8. On adding ammonia water to an aqueous solution of Copper Sulphate (1 in 10), drop by drop, a pale blue precipitate of cupric hydroxide will be formed, which redissolves in an excess of ammonia water, forming a deep azure-blue solution.

9. Weigh accurately about 1 gm. of unfloresced crystals of Copper Sulphate, dissolve it in 50 cc. of distilled water and add 4 cc. of acetic acid and 3 gm. of potassium iodide. The titration of the liberated iodine with tenth-normal sodium thiosulphate V. S., starch T. S. being used as indicator, should

indicate not less than 63.61 percent of anhydrous Copper Sulphate. Each cubic centimeter of tenth-normal sodium thiosulphate V. S. used corresponds to 0.015964 gm. of anhydrous copper sulphate ( $\text{CuSO}_4$ ).

10. Each gramme of Copper Sulphate, U. S. P., corresponds to at least 39.84 cc. of tenth-normal sodium thiosulphate V. S.

#### CYPRIPEDIUM.

Cypripedium. Lady Slipper Root.

1. The dried rhizome and roots of *Cypripedium hirsutum* Miller (*Cypripedium pubescens* Willdenow), or of *Cypripedium parviflorum* Salisbury (Fam. *Orchidaceae*).

2. Rhizome of horizontal growth, curved, 3 to 10 cm. long, 2 to 6 mm. thick, orange-brown to dark-brown, the upper side beset with numerous circular, cup-shaped scars, closely covered below with simple wiry roots, varying from 3 to 15 cm. in length; fracture of rhizome short, white, that of roots somewhat fibrous; odor distinct, heavy, valerian-like; taste sweetish, bitter, and somewhat pungent.

3. *Average dose*.—1 gm. (15 grains).

#### EUPATORIUM.

Eupatorium. Boneset.

1. The dried leaves and flowering tops of *Eupatorium perfoliatum* Linné (Fam. *Compositae*).

2. Usually more or less broken; leaves opposite, the pair united at the base, from 8 to 20 cm. long and 1.5 to 5 cm. broad, tapering regularly from near the base to an acute apex, crenate-serrate, rugosely veined, rough and bright green above, yellowish-gray-green, tomentose and resinous-dotted beneath; flower-heads small, numerous, corymbed, with a campanulate involucre of lance-linear imbricated scales and with from 10 to 15 tubular yellowish-white florets, having a bristly pappus in a single row; odor faintly aromatic; taste strongly bitter.

3. *Average dose*.—2 gm. (30 grains).

#### EUONYMUS.

Euonymus.

(Euonymus, U. S. P. VIII. Wahoo Burning Bush Bark.)

1. The dried bark of the root of *Euonymus atropurpureus* Jacquin (Fam. *Celastraceae*) with not more than 3 percent of adhering wood.

2. Usually in transversely curved pieces, occasionally in single quills, 2 to 7 cm. in

length; bark, 1 to 2.5 mm. in thickness; very light in weight; outer surface grayish or light brown, somewhat wrinkled, occasionally transversely fissured from the lenticels and with scale patches of soft cork; inner surface grayish-white, longitudinally striate and somewhat porous; fracture short with silky, projecting, modified bast fibers; odor distinct; taste bitter and acid.

3. *Powder*—Light brown; starch grains numerous, nearly spherical, 0.003 to 0.012 mm. in diameter; fragments of cork with nearly colorless thin walls; secretion cells with yellowish or brownish amorphous contents; bast fibers very long, with thin non-lignified walls possessing numerous small, more or less oblique pores; numerous fragments of parenchyma containing starch; calcium oxalate in rosette aggregates, 0.015 to 0.035 mm. in diameter, the amount in different specimens showing some variation.

#### EXTRACTUM CARNIS.

##### Extract of Beef.

1. The residue obtained from fresh beef broth by evaporation at low temperature.

2. A yellowish-brown to dark-brown, slightly acid, pasty mass having an agreeable meat-like odor and taste.

3. 25 gm. of Extract of Beef diluted to 250 cc. with distilled water yields a nearly clear solution, free from sediment. Portions of this solution should answer to the following tests:

4. 10 cc. of the solution boiled for one minute with 1.5 gm. of purified animal charcoal, the loss by evaporation restored and filtered, the filtrate produces no blue coloration when one drop is added to 3 drops of diphenylamine solution in concentrated sulphuric acid (1:100) (limit of nitrates).

5. 10 cc. of the solution when distributed over sand or asbestos and dried in a flat-bottomed porcelain dish to constant weight in an oven at a temperature of 105° C., yields a residue of not less than 0.75 gm., equivalent to 75 percent of solids in the original sample.

6. If the residue from 10 cc. of the solution be incinerated the ash must not exceed 30 percent of the residue, nor must the sodium chloride in the ash exceed 10 percent of the residue when calculated from the total chlorine as determined by the U. S. P. (Volhard) method.

7. To 100 cc. of the solution contained in a 500 cc. Kjeldahl flask, add 5 gm. of barium

carbonate, 100 cc. of water and distil 100 cc., using a connecting bulb, into 10 cc. of half normal hydrochloric acid V. S. Titrate the excess of acid, using cochineal T. S. as indicator, and from the acid consumed by the distillate, calculate the percentage of nitrogen as ammonia. This must not exceed .35 percent of the total solids.

8. Transfer 25 cc. of the solution to a 100 cc. Erlenmeyer flask, add 50 cc. alcohol and shake the mixture thoroughly. When the precipitate has subsided, filter, collect the precipitate upon a 9 cm. counterpoised filter, wash the precipitate three times with a mixture of alcohol and water (2 to 1 by vol.), and then dry it to constant weight at 105° C. The weight of this precipitate must not exceed 10 percent of the total solids. (Reserve the filtrate and washing for the determination of nitrogen.)

9. To an aliquot portion of the alcoholic filtrate from the preceding test corresponding to 1 gm. of the alcohol soluble solids, add 4 cc. of sulphuric acid and evaporate to dryness in a 500 cc. Kjeldahl flask. Determine the nitrogen by the Gunning-Kjeldahl method. The amount of nitrogen thus found must not be less than 0.06 gm.

#### FÆX COMPRESSA.

##### Compressed Yeast.

1. White or yellowish-white, soft and easily broken masses, having a characteristic slightly sour odor and not more than a faintly acid reaction to litmus.

2. When examined under the microscope numerous oidium and mycoderma cells and starch grains are seen.

3. Compressed yeast should not be used unless fresh and free from mildew and musty or foul odors.

#### FERRI HYPOPHOSPHIS.

##### Ferric Hypophosphite.

1. It should contain not less than 98 percent of pure Ferric Hypophosphite ( $\text{Fe}(\text{PH}_2\text{O}_2)_3=250.90$ ), and should be kept in well-stoppered bottles.

2. A white, or grayish-white powder, odorless and nearly tasteless; permanent in the air.

3. Soluble in 2300 parts of water at 25° C. (77° F.), and in 1200 parts of boiling water; more readily soluble in the presence of hypophosphorous acid, or in a warm, concentrated solution of an alkali citrate, forming with the latter a green solution.

4. When strongly heated in a dry test-tube,

the salt evolves spontaneously inflammable hydrogen phosphide gas, and, on complete ignition, leaves a residue of ferric pyrophosphate.

5. Ferric Hypophosphite is readily oxidized by nitric acid or other oxidizing agents.

6. If to 1 gm. of the salt 10 cc. of acetic acid be added, no effervescence should occur (absence of *carbonate*), and if the mixture be subsequently heated to boiling and filtered, the filtrate should respond to the following tests:

7. The addition of a few drops of silver nitrate T. S. to a portion of the filtrate should, upon warming, cause a brown to black coloration or precipitate. If another portion of the filtrate be added, drop by drop, to an excess of mercuric chloride, T. S., a white precipitate of mercurous chloride is formed upon gently heating.

8. Another portion of the cold filtrate should afford no turbidity with ammonium oxalate T. S. (absence of *calcium*).

9. Dissolve 1 gm. of the salt in 20 cc. of diluted hydrochloric acid, with the aid of heat, and then add 1 cc. of barium chloride, T. S. Not more than a slight turbidity should be produced (sulphate).

10. If 0.5 gm. of the salt be boiled with 10 cc. of potassium hydroxide T. S., a reddish-

brown precipitate will be produced; and if to the filtrate from the latter, slightly acidulated with hydrochloric acid, magnesia mixture T. S. be added, and subsequently an excess of ammonia water, no crystalline precipitate should be produced (absence of *phosphate*).

11. If 1 gm. of the salt be dissolved in about 25 cc. of boiling water by the aid of sufficient hydrochloric acid, added drop by drop, 0.2 cc. nitric acid added and the solution boiled and then a slight excess of ammonia water added, the filtrate from the precipitate should be colorless, and, after acidulating with hydrochloric acid, should not respond to the Time-Limit Test for *heavy metals*.

12. To 1 gm. of the salt add 10 cc. of nitrohydrochloric acid and evaporate to dryness. Dissolve the residue in 25 cc. of distilled water and 15 cc. of hydrochloric acid. Transfer it to a glass-stoppered container. Add 4 gms. potassium iodide and keep at 40° C for 30 minutes. Cool and titrate with N/10 sodium thiosulphate, V. S., using starch T. S. as indicator. It should show not less than 22% of Iron. Each cc. of N/10 sodium thiosulphate, V. S., used corresponds to 0.003384 gms. of Iron (Fe) and 0.023089 gm. Ferric Hypophosphite  $\text{Fe}(\text{PH}_2\text{O}_2)_3$ .

13. *Average dose*.—0.200 gm.=200 milligrammes (3 grains).

Looking across the Lagoon at the Palace of Fine Arts  
Panama-Pacific International Exposition

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished reprints by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

- 100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.
- 200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.
- 50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.
- 100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.
- 200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.
- 50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.
- 100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.
- 200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

## PAPERS FOR THE ISSUES OF JULY, AUGUST AND SEPTEMBER.

As the papers that were read at the Detroit meeting of the American Pharmaceutical Association have nearly all been printed, the editor requests that contributions for the succeeding numbers of the Journal be submitted. It is not desired to interfere with the work of the Sections and doubtless papers read at the Branch meetings will contribute largely to our present needs.

## PHARMACY IN THE ASCENDANT AT NEBRASKA.

It is not often that the honor to deliver a University convocation address comes to a pharmacist, but the University of Nebraska conferred upon me this honor recently by inviting me to deliver the address of the day at the University convocation on Thursday, May 13. The week, May 10 to 15 inclusive, was designated by the University as "Pharmacy Week" in recognition of the promotion of the department of pharmacy into the estate of a full college. Formerly it was a school. Not only has the department been elevated in rank, but it has been given the positive assurance that it may soon vacate its all too inadequate quarters and remove into a building entirely its own. The building assigned to pharmacy is the present chemistry-building, in which something over six hundred students are taught chemistry. The building is to be remodeled and adapted to the purposes of a college of pharmacy. Dean Lyman especially is very happy about this because it has been his constant endeavor since the school was first established in 1908 to secure for pharmacy a more equitable place among the University colleges. As valuable as the assigned new building, is the good will toward pharmacy on part of the University Chancellor and the Regents, who have promised their support toward the development of pharmaceutical education on a University basis in Nebraska. To this good fortune is added that growing out of the constructive activity of the Nebraska State Pharmaceutical Association through the work of whose president, who is also State Senator, Senator Brookley, the recently adjourned legislature enacted the law elevating the school of pharmacy into a college of pharmacy. This elevation places pharmaceutical education in Nebraska on a basis comparable with the ranks enjoyed by

other educational departments. This is only another evidence of the upward tendency of pharmaceutical education throughout the country. Not only are the colleges developing, but the state associations are taking more lively interest in adequate educational standards. The state boards, too, are stimulating the upward movement. The President of the Nebraska State Board of Pharmacy introduced a resolution at the Board meeting, held while I was at Lincoln, to make two years of high-school work the minimum academic requirement for eligibility to state examination.

It is some little satisfaction to Minnesota to know that Nebraska has been following the pharmaceutical educational development that has been going on in Minnesota and that it has found it worthy of emulation. Minnesota is especially pleased that Nebraska has now also fallen in line in the matter of recognizing medicinal plant cultivation as a legitimate and necessary activity of a college of pharmacy in its provision of adequate teaching facilities. Nebraska has a very respectable nucleus of a drug garden and is in a fair way soon to inherit room in some of the University plant houses for such work as can only be done in a greenhouse.

FREDERICK J. WULLING.

<>

#### DR. JOHN B. BOND, SR., RESIGNS FROM ARKANSAS BOARD OF PHARMACY.

After twenty years, faithful and efficient service, Dr. John B. Bond resigned from the Arkansas Board of Pharmacy, when that body met in Little Rock, May 10. No one in Arkansas has devoted more time nor accomplished more for pharmacy in this state than Dr. Bond, and he retires with the honors of faithful service. The action on his part was by the speedometer of time which indicated that rest was not only deserved but mandatory.

S. V. Bracy, of Little Rock, was unanimously elected to succeed Dr. Bond.

<>

#### GLYCERIN AND ACETIC ACID MENSTRUUM

In view of the fact that the tax on alcohol has been advanced in England, glycerin and acetic acid are again suggested as menstruum for preparations of drugs. William Wollstonehouse suggests a mixture of glycerin, 10 parts; acetic acid, 1 part; water to make 10

parts for menstruum. He gives the name of "Glyneture" to the preparation. Fluidglycerates are also referred to. In this connection it might be stated that the price of glycerin will likely advance considerably, but in any event will be much cheaper than alcohol.

<>

#### POTASSIUM SALTS IN JAPAN.

Professor Numura of the Tokio Imperial University states that sugar-cane waste, sawdust and timber will furnish an annual supply of 30,000 tons of potassium salts. Morphine and salicylic acid are now being manufactured in Japan.

### The Bulletin Board

#### THE SAN FRANCISCO MEETING OF THE AMERICAN PHARMACEU- TICAL ASSOCIATION.

The local committee of the American Pharmaceutical Association, through the co-operation of the Exposition Tour Service Company of San Francisco, have secured the Pellevue Hotel located at Geary and Taylor streets, San Francisco, as the headquarters of the American Pharmaceutical Association. This is one of the very best hotels in the city, of equal grade with the Palace and the St. Francis. The hotel is in a quiet place, yet within three blocks of the very heart of the business section of San Francisco and within from one to three blocks of the hotel center. The Geary street car passing the main entrance of the hotel, runs direct to the main entrance of the Panama-Pacific International Exposition grounds.

Through the Exposition Tour Service Company, a special rate has been secured for the members, families and friends of the American Pharmaceutical Association, which covers the following service:

Room with private bath at either the Bellevue or one of the first class hotels in the immediate vicinity of the Bellevue Hotel, to be occupied by two persons, from August 9 to August 11, inclusive.

Transportation by auto or taxi for each person, on arrival, from the depot to the hotel, and a like service on departure.

Transfer of baggage to and from the hotel.

Six tickets of admission to the Exposition

grounds to each person, such tickets good for admission any time on or before December 1, 1915, and may be used by any person. Those not used will be redeemed.

For the individual service above mentioned, a special price of \$25 is made for each adult person, payable as follows:

Ten dollars on making the reservation and the remainder, \$15, to the committee after arrival.

An attempt will be made to secure special rates for those who may desire to remain for a longer period. It will manifestly be desirable to know at the time of making the reservation whether or not it is desired to stay longer than the period of the convention.

Application for reservation may be made either to the Exposition Tour Service Company, 155 Sutter street, San Francisco, or to Albert Schneider, Local Secretary, 723 Pacific Building, San Francisco. The early applicants will be located in the Bellevue Hotel.

The above is the individual service to each member of the American Pharmaceutical Association. Taking into consideration the high grade hotel accommodations provided and the crowded condition of the city of San Francisco at this time, the above rates are remarkably low.

The details of the entertainment which will be provided for the members of the American Pharmaceutical Association and the other allied pharmaceutical associations will be announced later. The entertainment will include a trolley ride, boat trip on the Bay of San Francisco, visit to the Exposition concessions, grand ball and reception, theatre party, etc.

LOCAL COMMITTEE OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

(Signed) ALBERT SCHNEIDER,  
Local Secretary.

#### HOTELS.

The Bellevue has been selected headquarters of the Association, rates and accommodations are named in the report of Local Secretary Dr. Albert Schneider. For the convenience of members we append a list of hotels that may be corresponded with in advance of the meeting. The rates given will only serve as a guide, as far as our information goes the price named is for room with bath, one person. Rooms without bath would be lower and the usual advance for more persons in a room:

#### ENTERTAINMENTS.

The *Allied Drug Interests* of California, organized for the purpose of entertaining the druggists of the world during 1915, have headquarters in the Claus Spreckles Building at Third and Market Streets. D. R. Rees, Chairman of the Publicity Committee, sends the following tentative program of entertainments just to serve as a guide for the fun and frolic in store for all who attend:

Monday, August 9, 1915.

Reception and Dansant at Bellevue Hotel.

Tuesday, August 10, 1915.

Evening Fior D'Italia Dinner

Wednesday, August 11, 1915

Afternoon—

Ball at California Building.

Evening— P. P. I. E.

Thursday, August 12, 1915.

Afternoon Card Party for Ladies.

Friday, August 13, 1915

Morning 10 A. M. Trolley Trip.

1 P. M. Luncheon Old Faith Inn—

P. P. I. E.

Afternoon 2:30 to 3:30

Organ Recital at Festival Hall.

P. P. I. E.

## SIXTY-THIRD ANNUAL CONVENTION AMERICAN PHARMACEUTICAL ASSOCIATION.

To be Held in San Francisco, Cal.,

August 9-14, 1915.

Final announcement of Committee on Transportation:

On account of the very low excursion rates to the Pacific Slope and the attractions of the Panama-Pacific International Exhibition at San Francisco and the Panama-California Exhibition at San Diego, the rush travel this season to coast points will be greater than ever before, and for the convenience of our members and to secure their comfort, your Committee has arranged with the Chicago, Burlington & Quincy Railroad to run a special train from Chicago to San Francisco to be known as the "American Pharmaceutical Association Special," on which *no extra fare will be charged*.

Price of ticket good for three months, with stop-over privileges west of Chicago to go and return by any direct route:

From Boston, via N. Y. C. lines, \$104.20; other lines, \$101.20.

From New York, via N. Y. C. lines or Pa. lines, \$98.80; other lines, \$94.30.

From Philadelphia, \$95.20.

From Baltimore and Washington, \$92.95.

From Chicago, \$62.50.

From Cincinnati, \$70.25.

From St. Louis, \$57.50.

From Atlanta, \$72.55.

From Savannah, \$80.50.

From Jacksonville, \$80.50.

From New Orleans, \$57.50.

From St. Paul, \$63.83.

From Denver, \$45.

From all other points at proportionate rates.

To return via Portland an extra charge is made of about \$17.50 on each ticket, the exact amount of which can be ascertained from the ticket agent in your city.

Purchase your excursion tickets from your *regular ticket agent*, choosing your own route to Chicago, but seeing that beyond that point the route is C. B. & Q. to Denver; Denver & Rio Grande to Salt Lake; Western Pacific to San Francisco.

Route from the Special train will be as follows: C. B. & Q. to Denver, D. & R. G. to Salt Lake City, Western Pacific to San Fran-

cisco, and train will run on the following schedule:

Leave Chicago, Thursday, July 29th, at 11 P. M.

Arrive Denver, Saturday, July 31st, at 7:20 A. M.

Leave Denver, Saturday, July 31st, at 7:45 P. M.

Arrive Colorado Springs, Saturday, July 31st, at 10:28 P. M.

Leave Colorado Springs, Sunday, August 1st, at 10:35 A. M.

Arrive Salt Lake City, Monday, August 2d, at 1:30 P. M.

Leave Salt Lake City, Tuesday, August 3d, at 12:45 P. M.

Arrive San Francisco, Wednesday, August 4th, at 5:45 P. M.

The above provides for a 12-hour stop at Denver during which the local branch of the A. Ph. A. will entertain the party and there will be sight-seeing trips through city and suburbs.

At Colorado Springs the train will be parked for the night and those who rise reasonably early will be able to visit Manitou by trolley and take the carriage ride through the Garden of the Gods (arrangements for this will be made by F. W. Nitardy, Denver member of Committee on Transportation), before the train starts at 10:35 A. M. on its trip through the famous Royal Gorge, via the scenic D. & R. G. R. R. to Salt Lake, where in the afternoon of August 3d there will be a trip (personally conducted by local members of the A. Ph. A.) to the Mormon Temple and points of interest in the city. The train will be parked here for the night and in the morning party will visit the bathing place and amusement park on Salt Lake before boarding the train at 11:45 A. M. for San Francisco. From Salt Lake train is to be run over the Western Pacific through the famous Feather River Canyon to San Francisco.

A pamphlet in relation to above is in preparation and will be mailed to members of the Association.

Members traveling by above train will reach San Francisco in time to attend the sessions of the National Association of Boards of Pharmacy and the Conference of Pharmaceutical Faculties which are to be held on August 5th, 6th and 7th, while those who do not desire to attend these meetings will have these three days and Sunday in

which to visit the Panama-Pacific Exhibition or points of interest in San Francisco before the first session of the A. Ph. A. meeting which will be held on Monday, August 9th.

Members upon arrival should immediately register at headquarters, the Bellevue Hotel, where a special rate has been made of \$25 for six days for each room with private bath and six exposition admissions. For members who desire cheaper accommodations, rooms can be secured for \$1.00 per day upwards, \$1.50 per day with bath upwards, by addressing in advance of the meeting the local Secretary, Dr. Albert Schneider, 723 Pacific Building, San Francisco.

Regular Pullman rates will be charged on the A. Ph. A. special, but you must order reservations from W. Bodemann, Hyde Park, Chicago, Ill., the Chicago member of Transportation Committee, which should be ordered *at once* specifying whether upper or lower berth or drawing room is required.

Members must also choose their return routes when buying tickets, see suggestions that follow. The first three are northern routes, via Portland, for which the extra fare is charged.

Suggested routes to return from San Francisco:

Northern Route No. 1—Great Northern Pacific S. S. (no extra charge for berth and meals), or Southern Pacific R. R. to Portland; Great Northern R. R. to St. Paul (side trips through Glacier, National Park, from 1 day, \$8.25, to 7 days, \$47.50).

Northern Route No. 2—as above to Portland; Northern Pacific to St. Paul, via Livingston (original route Yellowstone National Park, six days, including transportation, hotels and meals, \$53.50), C. B. & Q. to Chicago, Omaha, St. Louis, Kansas City.

Northern Route No. 3—as above to Portland; Great Northern, or Northern Pacific to Seattle, boat to Victoria or Vancouver, Canadian Pacific, via Glacier, Field (for Emerald Lake and Yoho Valley), Laggan (for Lake Louise), Banff to St. Paul (via Winnipeg if desired), C. B. & Q. to Chicago, Omaha, St. Louis, Kansas City.

#### DIRECT ROUTES; NO EXTRA FARE.

No. 4—San Francisco to Los Angeles by Southern Pacific or A. T. & S. F. (side trip to Yosemite and Big Trees at special rate to be named in San Francisco), side trip Los Angeles to San Diego for Panama California

Exhibition by A. T. & S. F. R. R. at no extra charge if included in ticket at time of purchase. Salt Lake (side trip through Yellowstone, six days, \$53.50, including transportation, hotels and meals), Salt Lake to Denver, D. & R. G., thence by C. B. & Q. to Omaha, Chicago, Kansas City, and St. Louis.

Direct Route No. 5—Same as above to Los Angeles, thence by Southern Pacific R. R. to New Orleans.

Direct Route No. 6—Same as No. 4 to Los Angeles, thence via A. T. & S. F. to Kansas City via Williams (side trip to Grand Canyon, round trip, \$7.50), Adamana (for Petrified Forest; livery, \$3 each for two persons, \$2.50 each for three or more), C. B. & Q., Kansas City, Omaha, St. Louis, Chicago.

By ordering your Pullman reservations as soon as possible from Mr. Wilhelm Bode-mann, Hyde Park, Chicago, Ill., you will secure better accommodations and lighten the labors of your Committee.

Respectfully submitted,

For the Committee on Transportation,  
THOS. F. MAIR, Chairman.

#### SECTION ON COMMERCIAL INTERESTS

The Commercial Section is desirous of papers on the following list of subjects:

- 1=Meeting mail order competition. A plan outlined.
- 2= A system of stock arrangement as a help to reduce store expense.
- 3= Developing the sale of rubber sundries — photographic supplies — stationery — cigars.
- 4= Possibility of creating a National line of non-secrets, to be prepared by the individual but with common ownership of copyrighted labels.
- 5= Cooperation in purchases by druggists of a locality. Does it pay?
- 6= Mr. representation in merchandising.
- 7= Advertising the prescription department.
- 8= Is it advisable to give clerks a percentage of sales?
- 9= Your own non-secrets, compared with other line.
- 10= Window display that produce results.
- 11= Teaching salemanship to clerks.
- 12= Store fixtures as a help in developing business. What necessary or of advantage.

13= Perfumes—Manufacture of—Basic Material—Care—Selling Pointers.

14= Purchases — What — When — Where — Quantity limits.

15=Store management — Prevention of waste—Goods out of stock, etc., etc.

E. H. THIESING, Chairman,  
Gilbert and Lincoln Ave., Cincinnati, O.

#### THE HISTORICAL SECTION.

The Historical Section is desirous of papers concerned with early pharmacy in all States. Biographical sketches of pharmacists, letters and other literature, views of old pharmacies and contributions of pharmaceutical interest are solicited. Reports on native drug plants, used in the earlier days, and descriptive methods for making preparations of them, are also asked for.

FREDERICK T. GORDON, Chairman,  
2115 Medary Ave., Philadelphia.

### Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or type-written, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

#### BALTIMORE

The May meeting Baltimore Branch, American Pharmaceutical Association, was held in the Assembly Hall of Hanson, Westcott & Company's Pharmacy, S. E. corner Charles and Franklin Streets, Wednesday, May 19, at 8 p. m., with President F. W. Hodson in the chair.

The regular program was:

#### THE JOURNALS

Six of the journals have been assigned to as many different members, and we are to have presented, for our information and dis-

cussion, one or more articles from each. Dig out something interesting from your journal, bring it along and discuss it with us.

A Mystery by the Misses, or Pharmacists' Promised Pabulum and Palaver.

This is to be the last meeting till autumn, and the pharmacists are going to make good a partial promise "maiden" January.

On motion of Mr. Muhlhouse, the Secretary was directed to send a letter to Mr. John S. Donnett, expressing the sympathy and extending the condolence of the Branch to him in his recent bereavement in the death of his wife.

Only four of the journals were reported on and one of the should-have-been reporters sent in his regrets as to his unavoidable absence and, therefore, became a was-not-reporter, while in the other case, the most important item in that particular journal was pointed out as uninteresting and unentertaining to a gathering in which so many diversified interests were represented.

Miss Sonnenberg read extracts from an editorial commending the Branch's resolution on bettering the Latin of prescriptions and incidentally it was brought out, that the generally accepted pronunciation of a good many medical, chemical and pharmaceutical terms is incorrect and, in speaking, correct pronunciation is not only necessary but also imperative and consultation of a good, modern dictionary is advisable for new words and even for a number of old ones.

"Ouabain" was cited as not being pronounced on (rhyming with the "moo" of moo cows), but as "wa" (rhyming with jaw) bain.

"Enzyme," not as en-zyme (rhyming with dime), but as en-zim (rhyming with Jim).

The ruling as to allowing physicians to order a repeat of a narcotic prescription by giving an order for its refilling by simply writing the full number of the original on a blank along with the requirements as to registry number, date, name of patient, physician's name, etc., as required for the original, was considered as simplifying things.

Mr. Morgan called attention to an editorial about incorrect weights, and during its discussion, the practice of the average pharmacist to rely indefinitely on the accuracy of the weight, measure and thermometer makers' instruments, was condemned and, inasmuch as the Government Bureau of Standards will examine them for a nominal sum, it was re-

solved, that, "It is the sense of the Branch that more attention be paid to the accuracy of weights, measures and thermometers and that pharmacists should have them examined at least once by the Bureau of Standards and that they ought to have the weights and thermometers examined occasionally thereafter."

In this connection, it was brought out that supposedly accurate prescription scales are often inaccurate for small quantities and attention should be paid to the quality and condition of them.

A case was cited and corroborated in which it was stated that some years ago, it was not possible, from all the one-ounce graduates in stock at a local jobber's, to get a single one to graduate correctly from three drachms down.

In discussing, with Mr. Meyer, an article on making Syrup Hypophosphites and Syrup Hypophosphites Compound, by using only one hypophosphite, namely, calcium, and sulphates of the other metals, the alkaloids themselves and just enough sulphuric acid, to liberate sufficient hypophosphorous acid to dissolve the alkaloids and leave a necessary excess to insure a stable solution, the precipitated calcium sulphate being filtered out, suggested the possibility of using the same idea in making Elixir of the Glycerophosphates, of course, using calcium glycerophosphate as the source of the glycerophosphoric acid.

It was brought out that it would not be necessary to use scale soluble ferric phosphate if it was wanted for making Elixir Iron, Quinine and Strychnine Phosphates in large quantities.

The correct quantity of solution of ferric citrate could be made or used, and to it the exact amount of sodium phosphate should be added; this solution could be used without the necessity of scaling if the elixir is made from the oils, alcohol, water and syrup.

Mr. Hynson presented several articles from his journal and from a discussion of one of them, it was shown that the one-store pharmacist could compete with the chain stores by buying in quantities sufficient to give him a quick turn-over, thus tying up a minimum amount of money and yielding a greater profit on his capital than by stocking large lots at a greater discount, but at a slower turn-over and actually with less yearly profits on the total investment. Nothing was said as to the chain stores doing the same thing.

The pharmacists then assisted the phar-

macists to sit in social session while they served salad and so forth, and the Misses' Mysterious "Pharmacists Promised Pabulum Palaver" panned out particularly propitious.

The words "panned out" are used because they suggest nuggets, and the luncheon which was served by them was a veritable nugget as was suggested by the remark made by the son of Ham who delivered the coffee and said, "You all had better 'nu get busy."

Just before parting till the October meeting, a motion that "This elaborate spread be spread on the minutes and that the thanks of the Branch be extended to the pharmacists" was O. K'd by the pharmacists singing or near singing, "So say we all of us."

WM. J. LOWRY, JR., Secretary.

#### CHICAGO.

The Chicago Branch of the American Pharmaceutical Association met Tuesday evening, May 18, for the last monthly meeting of this season.

The meeting was called to order by President Craig. The question of delegates to the House of Delegates for the San Francisco meeting came up and the President was instructed to appoint three members as delegates preferably from among those who were reasonably sure of being at the meeting, and who had not been appointed from some other organization entitled to send delegates. The President deferred the announcement of the appointments until later. Our delegation was instructed, however, to offer the following resolution in the House of Delegates:

*Resolved*, That the question of the deletion of Squibb's and Sun Cholera Mixtures from the N. F. should be reconsidered by the N. F. Committee and that they should be reinstated into the text of the N. F.

The deferred election of a Branch Representative to the Council to fill the vacancy caused by the expiration of the term of Professor A. H. Clark was called for. Professor C. M. Snow was placed in nomination by Professor Day, the nomination being seconded by Mr. Orr. It was then moved, seconded and carried that nominations be closed. Mr. Snow was declared elected to serve as Council member for the Branch for three years from 1914.

Professor W. B. Day responded for the Legislative Committee and reported that the prospect for the final enactment of the State

anti-narcotic law was very good, but that the passage of the anti-vending law was not so promising and of the pre-requisite law even less so.

Mr. William Gray, on behalf of the Committee on Practical Pharmacy, read a paper entitled, "Redistilled Water versus Sterilized Distilled Water." He made an especial plea that pharmacists generally should respect the wishes and orders of physicians and when the call came for redistilled water to be prepared to furnish the same and not substitute sterilized distilled water. His paper was well received and discussed and was ordered sent along with a drawing of the apparatus to the editor of the Journal for publication upon approval by the publication committee.

E. N. GATHERCOAL, Secretary.

#### CINCINNATI.

The annual meeting of the Cincinnati Branch, A. Ph. A., was held at Lloyd Library, May 11, 1915.

The meeting was well attended, the President's annual address, the Secretary's annual report, the Treasurer's annual report, and particularly the annual reports of the various committees proving instructive and pleasing features.

The election of officers resulted as follows: President, Charles G. Merrell; First Vice-President, J. F. Kutchlauch; Second Vice-President, Louis Werner; Treasurer, Julius Greyer; Secretary, Charles A. Apmeyer; Member Executive Committee, E. H. Thiesing.

The installation of the newly-elected officers followed, each one pledging himself to further the interest to the best of his ability, not only for the local Branch, but also for the parent body.

The membership list of the Cincinnati Branch shows fifty members of record.

CHAS. A. APMEYER, Secretary.

#### CITY OF WASHINGTON.

The April meeting of the City of Washington Branch of the American Pharmaceutical Association was held at the National College of Pharmacy, Wednesday, May 28, 1915.

The subject presented for discussion was the "Quality of Some Drugs Examined in the District of Columbia," by Dr. L. F. Kebler, Chief of the Drug Laboratory, U. S. Department of Agriculture.

Owing to the absence of Dr. Kebler, he having been called from the city, the subject was presented by Messrs. Murray, Palkin and Dr. Emery, of the Bureau of Chemistry.

The various products considered were Spirit of Nitrous Ether; Aromatic Spirit of Ammonia; Tincture of Iodine, and several Camphor Preparations (Tincture, Liniment and Soap Liniment), and numerous prescriptions which will be given below in detail.

Much interesting data was presented, and while the results in some cases showed that the preparations were below the standard, several were above. Careless manipulation, careless weighing or measuring of material or the use of inaccurate weights and measures are evident and go to show that the system usually followed in compounding prescriptions and manufacturing preparations by the average retail pharmacist is badly in need of readjustment.

#### SPIRIT OF NITROUS ETHER.

The samples taken of this product showed from slightly above the standard to as low as  $\frac{1}{2}$  of 1% Ethyl Nitrite. In not a single case was it shown that the product was assayed after being manufactured.

The Bureau has conducted many experiments to determine the keeping qualities of this product, and also as to what causes the decomposition, from the results already obtained, the work not yet having been completed, it is very clearly demonstrated that a properly made sample, using official alcohol, will keep for at least six months under the average store conditions. The greatest disturbing element in the decomposition of this product is water, causing hydrolysis to take place, resulting in decomposition in a very short while. The product if kept in small amber containers in a cool place with a trace of potassium bicarbonate present to neutralize any acid if formed, will keep for at least six months.

#### SPIRIT OF CAMPHOR.

The poorest samples of this product showed respectively —80%, —70%, —60%, —57%, —20%, —18% in camphor content, one specimen contained but 33% alcohol; with this product competition could be readily met and yet show a profit.

#### LINIMENT OF CAMPHOR.

One specimen examined was short in camphor content 90% and numerous showed —65%, —34%, —31%. The specimen 90% de-

ficient was due to attempting to hurry the solution of camphor by use of a water bath, the container fractured, and the oil was then skimmed from the surface was the excuse offered at the hearing.

#### LIME WATER.

Many samples were taken, much interesting data was given tending to show that the necessary precautions with reference to manufacture and keeping of the product were ignored or neglected, one specimen was deficient in calcium hydroxide 99%, several were deficient —70%, —40%, —30%.

#### TINCTURE OF IODINE.

One specimen was 68% short in potassium iodide content, several contained but a trace, and others contained none; shortages of Iodine of —20% and —18% were common. At the hearing, one druggist admitted that his tincture of iodine was made by dissolving the contents of a one ounce bottle of iodine, without weighing same, in one pint of commercial alcohol, and that he used no potassium iodide. There was one specimen that contained —7% potassium iodide.

#### SPIRIT OF AMMONIA AROMATIC.

Considerable variation in both water of ammonia and ammonium carbonate content was found, clearly indicating the use of efflorescent ammonium carbonate and a deficiency in strength of the ammonia water that was used, not a single one showed that they had assayed the product after making. One specimen contained nearly three times the amount of ammonia gas required, clearly indicating the use of stronger water of ammonia instead of water of ammonia.

The following prescriptions were summarized, and while the data given shows some variations, as a whole they were better than previously shown with reference to compressed tablets on the market:

#### No. 1—16 Samples.

Antipyrine ..... 2 grains

Sodium Salicylate ..... 5 grains

Make 10 such capsules.

Variation, from 1.28 to 2.17 grains, or —36% to —8% in antipyrine and 4.49 to 6.22 grains, or —10% to +20% in sodium salicylate.

#### No. 2—18 Samples.

Antipyrine ..... 2 grains

Sodium bicarbonate ..... 10 grains

Make 10 such powders.

Variation, from 1.9 to 2.7 grains, or —5% to —35% in antipyrine and 4.9 to 10.2 grains, or —50% in sodium bicarbonate.

## NASHVILLE.

## No. 3—20 Samples.

Phenacetine ..... 5 grains  
Salol ..... 5 grains

Make 10 such capsules.

Variation, from 4.2 grains to 5.16 grains, or — 16% to + 11% in phenacetine and 3.81 to 5.25 grains, or — 24% to + 5% in salol.

## No. 4—20 Samples.

Salol ..... 3 grains  
Quinine sulphate ..... 3 grains

Make 10 such capsules.

Variation, from 2.17 grains to 3.44 grains, or — 27% to + 15% in salol and 1.79 to 3.56 grains, or — 40% to + 18% in quinine sulphate.

## No. 5—55 Samples.

Acetphenetidin ..... 3 grains  
Bismuth subnitrate ..... 3 grains  
Sodium bicarbonate ..... 10 grains

Make 10 such powders.

Variation, from 1.5 grains to 3.8 grains in acetphenetidin, or — 50% to + 27%.

Prescription No. 1 showed two substitutions of acetanilide for antipyrine; under no conditions was this excusable. No. 5 likewise showed two substitutions of acetanilide for acetphenetidin and one for bismuth subnitrate, subcarbonate being used. If the prescription had called for a liquid in connection with the combination the pharmacist would have been justified in using bismuth subcarbonate.

In summing up and considering the excuses offered for the many shortcomings, many were cited that were given at the hearings. All of them tended to show the lack of proper checking system for both weights and measures and also methods in compounding and manufacturing. The lack of good judgment in many cases likewise was demonstrated, as for example, the cleaning of weights with sand soap and hydrochloric acid; the weighing of material on paper without previously counterpoising the paper; the use of weights for years without testing same as to accuracy, or the replacing with new ones. These conditions no doubt account for the inaccuracies in compounding.

Much discussion followed, numerous questions were asked and answered by the gentlemen from the Bureau of Chemistry which developed a general feeling that much good would be accomplished from the presentation of the true conditions, as found by careful investigation.

S. L. HUNOX,

Secretary

The Nashville Branch, A. Ph. A., held its regular meeting at Bloomstein's Hall, April 14, with President E. F. Trolinger in the chair. Following the approval of the minutes a communication was read from Professor H. P. Hynson in regard to abolishing the House of Delegates. A free discussion of this followed. The consensus of opinion was that the House of Delegates being a new organization should be tried out thoroughly before abolishing it. The idea of bringing the State Associations in closer touch with the American Pharmaceutical Association was favored.

The passage by the State Legislature of a stringent law regulating the sale of alcoholic liquors by druggists was announced. The bill provides that the amount kept on hand at no time can exceed one percent of the value of the stock; that it can be dispensed only on the written prescription of a licensed physician who has visited the patient at his domicile, and that both druggist and physician must preserve records of the prescription for two years. The enforcement of the law is made the duty of the State Food and Drug Inspector. Recent rulings on the Harrison Law were read and discussed.

Dr. J. O. Burge read abstracts referring to flavorings for cod-liver oil, para dichlor benzene, the new insecticide, and on a new test for cancer. W. R. White called attention to the recent discovery by Dr. Rittman of a new process for obtaining toluol and benzole from petroleum oil and its possible bearing on the dye industry of this country; to the discovery of a new alkaloid called struxine from nuxvomica by Hugo H. Schaefer, and to the use of scopolamine hydrobromide and morphine in producing a semi-conscious effect on labor patients, called Twilight Sleep. Dr. Riddiman seriously questioned its advantages over the usual methods of treatment.

W. R. WHITE, Secretary.

<>

## NEW YORK

Minutes of the regular meeting of the New York Branch of the American Pharmaceutical Association, held in the New York College of Pharmacy Building, April 12, 1915, President Roemer in the Chair.

Upon motion, reading of the minutes of preceding meeting was dispensed with.

Treasurer's report received with thanks.

Mr. McElhenie, member of the Council being absent, no report was received.

Reports of Standing Committees:

Membership—Absent.

Legislation and Education—Absent.

Fraternal Relations—Chairman Berger reported progress.

Progress of Pharmacy—Professor Dickman read a very interesting report covering the following subjects: Adigan, a new digitalis preparation; Grotan, a powerful disinfectant; the use of magnesium sulphate in tetanus; the use of hydrazin and dioxim in a delicate test for iron; Histamin obtained from ergot, its uses and properties; a method for the determination of silver in colloidal preparations; a method for the rapid determination of heavy mineral oil in vegetable oils or paints; purity and manufacture of acetyl-salicylate of calcium; the disturbing influence of alcohol and other fluids on certain reactions; a criticism of the aldehyde test in chloroform; Lavonat, a preparation used for infections of mucous surfaces; an abstract of a very interesting and exhaustive article on hair-dyes, as used past and present. Dr. Ditmar-Graz in Der Seidenfabrikant, 1914, gives exhaustive directions for manufacture and application as well as condemnation of those containing lead or silver and some organic compounds.

Messrs. Lascoff, Diner, and Dickman then spoke relative to the decease of Thomas F. Raymow, and the President appointed Messrs. Diner, Raubenheimer and Hostmann a committee to draw up a suitable set of resolutions.

Mr. Thomas F. Main then addressed the members, explaining what arrangements were being made by the Committee on Transportation for the San Francisco Convention.

Communications from Secretary Day and Professor Remington were read.

Dr. Mayer suggested that a dinner be held to celebrate the closing of the season, and President Roemer appointed Messrs. Mayer, Mansfield and Hostmann as a committee to make arrangements therefor.

Dr. Leo Fried then read a paper on "Data and Method of Assay of Iodine Ointment." After discussion by Messrs. Diner, Weinstein, Mayer, Turner and Raubenheimer the same was received with thanks.

President Roemer then presented a paper entitled, "Phenomena of Drug Action." This paper called for a very spirited discussion,

taken part in by many of the members present.

After extending a rising vote of thanks to the speakers the meeting adjourned.

<>

Minutes of the regular meeting of the New York Branch of the American Pharmaceutical Association, held in the New York College of Pharmacy Building, May 10, 1915, President Roemer in the Chair.

The minutes of the April meeting were adopted as read.

The Treasurer, Member of Council, and Chairmen of the Committees on Membership, Legislation and Education, Fraternal Relations were not present and no reports were received. President Roemer read a letter of regret from Dr. Diekman, Chairman of the Committee on Progress of Pharmacy, explaining his absence.

The committee on "Raymow Resolutions" presented their report, which was adopted, and the committee was discharged with thanks.

THOMAS F. RAYMOW.

WHEREAS, The members of the New York Branch of the American Pharmaceutical Association have learned with great regret of the death of Thomas F. Raymow, a fellow-member, on April 12, 1915.

*Be it Resolved*, That as an expression of the deep sense of personal loss felt by the members of this Branch, a page in the minutes be set aside for these resolutions, and,

*Be it furthermore Resolved*, That the members of the Branch hereby extend to his family their deepest condolences in this hour of great bereavement, and,

*Be it furthermore Resolved*, That the Secretary be directed to forward a copy of these resolutions to the family of our deceased member.

(Signed) JACOB DINER,

JEANNOT HOSTMANN,

OTTO RAUBENHEIMER,

Committee.

Chairman Mayer, for the Dinner Committee, in reporting suggested that the date of dinner be postponed to the fall and, upon motion, the committee was continued with directions to act upon said suggestion.

Dr. Robert A. Hatcher and his associate, Dr. Eggleston Cary, then reported upon their investigations regarding the stability of Infusion of Digitalis. They brought out the following facts: That alcohol is of no value and needless as a preservative agent; that if properly prepared and kept under ordinary conditions the loss in therapeutic activity up

of 10 per cent. of three times as much negligible. The proper solvent for the extract should be a No. 600 Alcohol and the infusion should be prepared by maceration for 24 hours in a bath of boiling water with subsequent filtration.

According to the speakers, the theory that different digitalis preparations possess different therapeutic properties has been finally and positively disproved. Gram for gram the infusion will exhibit exactly the same therapeutic results as the tincture or fluid extract.

A sample of digitalis leaves that had been macerated with an equal weight of water for four months, although completely covered with mold and having the characteristic earthy odor, when tested had only lost 50 per cent. of its toxic properties.

Following an extended discussion, taken part in by many of the members, a rising vote of thanks was extended to the speakers, who undoubtedly will present a paper at a future date after completion of their investigation.

"Liquid Petroleum, Russian and American" was the title of a very interesting paper presented by Mr. E. H. Gane, in which he pointed out, that American oils can now be secured that are equally as good as the Russian. Particular stress was laid by the speaker upon the importance of the viscosity rather than the gravity in determining their medicinal value. A line of important tests as well as tabulated results of a series of examinations carried out by Mr. Gane on twelve market samples are given.

The paper called for a spirited discussion, during which the tests as well as the value of various oils were gone over.

After thanking the speaker for his interesting paper nine new members were elected and the secretary was ordered to send return postal cards to all members asking them to vote upon the desirability of holding semi-monthly meetings beginning with the October meeting.

JESSE H. HOLMES, Secretary

#### WEST VIRGINIA

The West Virginia Branch of the American Pharmacological Association held a meeting at the Ward or Hotel, Wheeling, W. Va., on the evening of May 5, 1915, at 8 o'clock. This was the initial meeting of the Branch in Wheeling and was enthusiastically supported

by the local pharmacists and those from nearby towns. The Wheeling Druggists' Association, the local organization, had the arrangements in charge and a general invitation was extended to both physicians and pharmacists as well as to the young men who were presenting themselves before the State Board of Pharmacy for registration examination.

Professor W. A. Schultz, formerly of the U. S. Public Health Service and now head of the Department of Pharmacology of the West Virginia University, and Professor Charles E. Rogers, Dean of the School of Pharmacy, West Virginia University, gave a most interesting discussion on "Some Recent Developments in Physiological Assays." The various methods, both old and new, for assay of the members of the digitalis group, ergot and cannabins were demonstrated. Several samples collected from the trade were assayed and their comparative value determined with regard to preparations made from properly cultivated and collected drug. The discussion and particularly the demonstration of the actual work by specialists in this line of endeavor was a revelation to many present and kindled a desire in the pharmacists to handle only standardized, dated preparations. Those of the medical profession present, enthusiastically supported such sentiments.

Dr. A. Arkin, Head of the Department of Pathology and Pathology of the School of Medicine, West Virginia University, also gave a most interesting discourse on "Biological Products and Their Properties." The understanding of these preparations by the average pharmacist has always been more or less hazy. Dr. Arkin presented the subject in such a manner as to be appreciated and understood by all present.

A number of local gentlemen were heard from, and the pharmacists of West Virginia were urged to appreciate the professional side of their calling and to make the most of it. A vote of thanks was tendered those taking part in the program. The meeting formally adjourned and was concluded by a social gathering and supper.

A. B. BEERY, Secretary

Courage is the thing which enables a man to tackle a hard task with ease. Nerve is the thing which enables him to tackle it when he's tired to death. — Tips.

## Colleges

### LOUISVILLE COLLEGE OF PHARMACY.

The Commencement exercises of Louisville College of Pharmacy were held May 11.

The list of graduates follows: Edwin Forrest Abbott, Eskdale, W. Va.; Jasper Jones Bailey, Hanson, Ky.; Theophilus P. Brown, Stanford, Ky.; Hugh T. Collins, Lawrenceburg, Ky.; Frank Bernard Dougherty, Jeffersonville, Ind.; Curtis B. Dozier, Thomasville, Ala.; Elias A. Dunbar, Jamestown, Ky.; Luther C. Ellis, Glasgow, Ky.; David U. Garber, Jellico, Tenn.; Ernest S. Julian, Cleveland, Tenn.; Jonathan B. Legg, Clifty, W. Va.; Wilbur R. Parks, Irvington, Ky.; William Orville Patterson, Hawesville, Ky.; Hart L. Perry, Richmond, Ky.; Frank W. Richey, Cannelton, Ind.; Robert W. Schroader, Murray, Ky.; William B. Schultz, Middlesboro, Ky.; Charles H. Tye, Barbourville, Ky.; Vernon Valentine, New Castle, Ky.; Clay Louis Vallandingham, Owenton, Ky.; John W. Wear, Murray, Ky.; Clarence H. Adams, Robert P. Brumleve, Carl J. Eilers, Samuel Levinstein, Harry L. Pfeiffer, Jack Posnansky, Arthur T. Schreiber, Joseph C. Seitz and Karl H. Strober, of Louisville.

<>

### NEW YORK COLLEGE OF PHARMACY.

The George J. Seabury Scholarship has been established in New York College of Pharmacy, having been founded by Dr. Henry C. Lovis in memory and honor of his uncle, George J. Seabury. This scholarship entitles its holder to the fourth year of University study in the College and leads to the degree of Bachelor of Science in Pharmacy. It is therefore open only to the graduates of the three-year University Course, who hold the degree of Pharmaceutical Chemist.

<>

### MASSACHUSETTS COLLEGE OF PHARMACY.

The Commencement exercises of Massachusetts College of Pharmacy were held May 26. The ceremonies were presided over by President C. Herbert Packard and the address to the graduates was delivered by A. A. Berle, D. D. The degree of Pharmaceu-

tical Chemist was conferred on: Elmer William Bennett, Ph. G., Westboro; William Charles Bruzga, Ph. G., South Boston; Malcolm Sherwood Field, Taunton; Edward Rudy Gifford, Ph. G., Dorchester; William Wallace Gifford, Ph. G., Dorchester; Robert Mugerlich Kallejian, Pharm. D., Hartford, Conn.; Albert Solomon Pearlman, Ph. G., Boston.

The following received the degree of Graduate in Pharmacy:

Florin Joseph Amrhein, Roxbury; Gilbert Shove Arnold, Jr., Hopedale; Charles Joseph Babb, Middleboro; Edward Romeo Bouthillier, Milford; Raymond Gannett Cooper, South Natick; John Francis Correa, Jr., New Bedford; John Dorenbaum, Springfield; Ovide Albert Dumas, Worcester; Armand Merrill Dupaul, Southbridge; James George Elkind, Worcester; Fay Harold Elliott, Groveton, N. H.; Theodore Gibbs Flagg, Southborough; Joseph Gagne, Williamansett; George Peter Gakidis, Manchester, N. H.; Howard Francis Gilbride, Malden; Rosamond Alice Guinn, New Bedford; Jesse Earl Henry, Cameron, W. Va.; Elmer Severin Johnson, Orange; Zusya Kagan, Roxbury; Jorge Manuel Menendez, Matanzas, Cuba; Joseph Nathan Meyers, Dorchester; Max Samuel Miller, Cambridge; William Joseph Nolan, M. D., New Britain, Conn.; Federico Emilio Perez, Santiago, Cuba; Howard Richard Pierce, Enfield, N. H.; James Weston Pratt, Quincy; Harry Alexander Shapiro, Portsmouth, N. H.; Revashanker Maganlal Shukle, Matar, India; Oakley Smith Skinner, Windsor, Vt.; Alfred Richard Trimbach, Lewiston, Me.; John William Vigeant, Great Barrington.

### MASSACHUSETTS COLLEGE OF PHARMACY AWARDS A. PH. A. PRIZE MEMBERSHIPS.

Five prizes, each consisting of a nomination to membership in the American Pharmaceutical Association and the first year's dues were offered at the Massachusetts College of Pharmacy during the past year, for the best year's records in the senior subjects. The prizes, with their donors and recipients, were as follows: Pharmacy, offered by Professor E. H. LaPierre, awarded to Florin J. Amrhein of Roxbury, Mass.; Analytical Chemistry, offered by Dean T. J. Bradley, awarded

to Armand M. Dupaul of Southbridge, Mass.; General Chemistry, offered by President C. H. Packard, awarded to Oakley S. Skinner of Windsor, Vermont; Organic Chemistry, offered by Treasurer John G. Godding, awarded to Harry A. Shapiro of Portsmouth, New Hampshire; and Materia Medica, offered by Professor H. H. Smith, awarded to James W. Pratt of Quincy, Mass.

#### SCHOOL OF PHARMACY OF THE UNIVERSITY OF ILLINOIS.

The Commencement exercises of the School of Pharmacy of the University of Illinois were held in New Central Music Hall, Chicago, April 28. Professor Joseph Price Remington delivered the address; Judge O. A. Harker, Dean University of Illinois Law School and representing President Edmund J. James of the University of Illinois, conferred the degrees.

List of the class: Received the degree of Graduate in Pharmacy: Richard Joel Anderson, Chicago; Samuel Leon Baker, Gary, Ind.; Mike Robert Bianco, DuQuoin; Frederick Evenson Boehm, Neenah, Wis.; Marshall Theodore Brekke, Rice Lake, Wis.; Walter Otto Buckrucker, Chicago; Guy Brooks Davis, Abingdon; Ray Robbins Davis, Abingdon; Grover Oliver Draais, Onawa, Iowa; Harry Leo Eberly, Aurora; Roy Fred Fraser, Elizabeth; Victor Leo Geispitz, Chicago; Louis Andrew Gorham, Chicago; Louis Leo Haffner, Bloomington; Ralph Hawthorne, Alma; Michael Jacobson, Chicago; George William Jindrich, Chicago; Archie Kirkwood Johnson, Joliet; Joseph John Kakacek, Chicago; Rudolph Henry Krebs, Milford; Theodore August Joseph Leckband, Grand Mound, Iowa; Charles James Lesko, Chicago; Stephen Edward Malkewicz, Chicago; Bates A. Marriott, Galeburg; Philip Aloysius Masterson, Clinton, Iowa; Franklin Christopher Mueller, Jefferson, Wis.; Frank Charles Niemeyer, Stockton; Oswald Edward Fred Obermiller, Galena; Joseph Winfred Rayercraft, Springfield; Robert Charles Reed, Quincy; Harold Franklin Seeger, Beardstown; Bayard Edwin Simmons, Chicago; Ernest Lee Slinkard, Grand Junction, Colo.; Clifford Ross Spalding, Clinton, Iowa; August Ferdinand Stahl, Jr., Chicago; Stewart Strain, Chicago; Roy William Woelfler, Lake Mills, Wis.; Lawson Jacob Cooke (Class of '13), Good-

land, Ind.; Fred Lehman Leib (Class of '14), Anna; Lillian Vorsanger (Class of '12), Chicago.

Received a certificate of having finished the course successfully. Will receive the degree when the required age and practical experience are obtained: Monte Allen, Gray's Lake; Kenneth Frederick Allman, Rensselaer, Ind.; Edward Anthony Felix Borucki, Chicago; William Stuhlman Bucke, Chicago; Carroll Edwin Bundy, Sheldon; Byron Eugene Clay, Lena; Raymond Earl Faulkner, Fulton; Richard William Goltermann, Forest Park; Sylvester Henry Hojnacki, Chicago; Oscar William Johnson, Chicago; Harry Kanta, Chicago; Edward Joseph Kral, Chicago; Joseph Benjamin Kva-nicka, Chicago; Arthur Henry McKenty, Chicago; Mark Eldon Neville, Gray's Lake; Joseph Pelc, Chicago; Domingo Poli, Guayama, Porto Rico; Young Rey, Soon Chun, Korea; Edwin Robert Riemer, Chicago; Edwin Palmer Scruggs, Livingston, Ala.; Walter Manson Vander Bogart, Wilmington; Louis Wischnia, Chicago.

Received certificates as special students: LeRoy Eugene Anderson, Moline; Charles Roy DeWitt, Pocatello, Idaho; Samuel Michael Gordon, Chicago; Charles Hugo Grund, Jr., Chicago; Carl William Hanichen, Chicago; Leslie Eugene Harden, Rockefeller; Anton Sylvester Jaglowski, Chicago; Leopold Levinowitz, Chicago; Otto Lisee, Chicago; George Edward Nemec, Chicago; George Ray Olson, Chicago; Lloyd Earl Throckmorton, Peoria; Sidney Bradley Trippett, Texarkana, Ark.; Clarence Edward Wiles, Kankakee.

#### TWO SPECIAL LECTURES AT THE JERSEY CITY COLLEGE OF PHARMACY.

The last of the series of special lectures was delivered at the Jersey City College of Pharmacy on Friday afternoon, April 30, the Faculty, the students, the nurses of the Jersey City Hospital Training Schools and many prominent physicians and pharmacists being present.

Dr. Paul S. Pittenger, Pharmacologist of the H. K. Mulford Company, Philadelphia, and an authority on the subject of Physiological Assays, delivered a highly educational and interesting lecture on "Biological Assays." The following is an outline: In-

troductory, Definitions, List of Drugs requiring Biochemic Assays, Variation in Strength of non-standardized preparations, Necessity for Biologic Assay Methods, Standardization of Crude Drugs, and Deterioration.

Dr. Pittenger briefly described and demonstrated one or more methods coming under each of the three types, namely: *First type*, Reed and Vanderkleed Guinea-pig method, Houghton's 12-hour method, Famulaner & Lyon's 1-hour method; *second type*, Blood-pressure method for suprarenal extract, Blood-pressure method for ergot; *third type*, Isolated uterus method for Pituitary.

A rising vote of thanks was given to Dr. Pittenger and his Assistant, Dr. Wall, for this excellent lecture and demonstration.

Dr. B. S. Pollak, Medical Director of the Hudson County Tuberculosis Hospital in Snake Hill, addressed the students on the very important subject, "Problems on the Prevention of Tuberculosis." Dr. Pollak explained the origin and the history of the disease and also the various stages, and he undoubtedly convinced his audience that tuberculosis is one of the most dreadful of all diseases and that all precautions should be taken individually as well as municipally and even under federal control.

#### NEW ORLEANS COLLEGE OF PHARMACY.

The New Orleans College of Pharmacy held Commencement exercises May 14 in Marquette Hall of Loyola University, the Dean, Dr. Philip Asher, presiding. The A. Ph. A. membership was awarded to Hypolite Rene Niques. The following is a list of the graduates:

Leonce J. Aucoin, Louisiana; Rene J. Bienvenu, Louisiana; Mertie M. Bloom, Louisiana; Alvin S. Brizzard, Louisiana; Leon Aloysius Gabrol, Louisiana; George D. Comeaux, Louisiana; Fred Rufo Crosby, Louisiana; W. Elmo Doucet, Louisiana; Edgar E. Ewing, Louisiana; John Robert Germany, Louisiana; Harry Goldstein, Louisiana; Antonio M. Gonzalez y Falcon, Cuba; Odon J. Lonibos, Louisiana; Manuel Lopez y Quintana, Cuba; Eloi L. Melancon, Louisiana; Guillermo Perez y Pena, Cuba; Robert Lane Pollock, Louisiana; Laurance Rappleye Rolling, Louisiana; Miss Anna Bar-

bara Schneider, Louisiana; T. A. Scott, Louisiana; Miss Vernona E. Stumpf, Louisiana; J. Warren Tarbox, Louisiana; Eugene Waldemar Vogt, Texas; George B. Welsh, Louisiana; Harold B. Williams, Texas; Hypolite Rene Niques, Louisiana.

#### ST. LOUIS COLLEGE OF PHARMACY.

The Commencement exercises of the St. Louis College of Pharmacy were held in Sheldon Memorial Hall, May 19.

Dr. John C. Falk, President of the College, conferred the degrees. The Graduate in Pharmacy and Bachelor of Pharmacy Classes were introduced by Dr. H. M. Whelpley, Dean, and the Pharmaceutical Chemist Class was introduced by Prof. Charles E. Caspari.

The Valedictory Address, "Drugs and the Man," was delivered by Mr. Arthur E. Bostwick, Librarian of the St. Louis Public Library.

The alumni prizes were conferred by Dr. Wm. H. Thaler, while Dr. O. A. Wall announced the College prizes and honors.

The following degrees were conferred:

##### GRADUATE IN PHARMACY.

Louis Abramson, Moline, Tchernigoff, Russia; Clyde Murphy Anderson, Rockville, Mo.; Leslie William Barnes, Cuba, Mo.; George Bosche, Ph. B., 1911, St. Louis, Mo.; Glenn Adrian Burkart, St. Louis, Mo.; Walter Arden Burkart, St. Louis, Mo.; Paul Augustus Burnette, Ph. B., 1913, St. Louis, Mo.; Philip Ludger Chiles, St. Louis, Mo.; Alfred William Couch, De Soto, Mo.; Curt Louis Dauber, Mascoutah, Ill.; Lyman Armenious Demand, Warrensburg, Mo.; Edmunds Grey Dimond, Winona, Miss.; Gustav Adolph Dorullis, Centralia, Ill.; Joseph Frank Evans, Mountain Grove, Mo.; Joseph Frey, St. Louis, Mo.; Carter Giles Gibson, Hope, Ark.; Willard Arthur Guyton, Potosi, Mo.; Theodore Charles Hagenow, St. Louis, Mo.; Jesse Everett Harmon, Houston, Mo.; Samuel Honigberg, St. Louis, Mo.; Walter Edwin Howald, Cuba, Mo.; Walter Sylvester Hunter, Macon, Mo.; Frank Eugene Lane, Jr., St. Louis, Mo.; Lawrence Roscoe Marglous, St. Louis, Mo.; Albert John Martin, St. Louis, Mo.; Otto John Moser, Ph. B., 1910, St. Louis, Mo.; Andrew Louis Muentefering, East St. Louis, Ill.; Theodore John Nelligan, St. Louis, Mo.; Henry William Reiss, St. Louis, Mo.; Charles Herman Riley, Salem,

Mo.; Kenneth Nye Robinson, Warrensburg, Mo.; E. Francis Sennewald, St. Louis, Mo.; Enos Sanford Sisk, Licking Mo.; Othmar John Sum, Washington, Ind.; Clarence Robert Walker, Hermann, Mo.; George Marcus Weiss, St. Louis, Mo.; Floyd Loftus Welch, Warrensburg, Mo.; Louis Franklin Westlake, St. Louis, Mo.; Farrar McNeal Wilson, Lebanon, Mo.; John Zajicek, Collinsville, Ill.

#### BACHELOR OF PHARMACY.

Herbert William Bixon, Middlebrook, Mo.; Harry Erwin Grafe, St. Louis, Mo.; Leo George Kohl, Belleville, Ill.; Roland Henry Kraege, Yorktown, Tex.; Walter Scott McCormack, Koshkonong, Mo.; Burl Hulbert Smith, East St. Louis, Ill.

#### PHARMACEUTICAL CHEMIST.

Harold Rufus Rowe, Ph. G., 1913, Willow Springs, Mo.

The recommendation for membership in the American Pharmaceutical Association, with dues for 1915 given by the College, is awarded to Samuel Honigberg, St. Louis, Mo.

#### ALUMNI ASSOCIATION OF THE UNIVERSITY OF ILLINOIS SCHOOL OF PHARMACY.

The thirty-third annual reception and banquet of the Alumni Association of the University of Illinois was held at the Congress Hotel, Chicago, Wednesday evening, April 28. One hundred and twenty-five alumni and friends were present. The members of the graduating class were the guests of the Alumni Association, while the guests of honor were Professor Joseph P. Remington, Dean of the Philadelphia College of Pharmacy, and Judge O. A. Harker, Dean of the Law School of the University of Illinois. Toasts were responded to as follows:

The University of Illinois—Judge O. A. Harker.

Pharmacy—Professor J. P. Remington.

The Alumni Association—President L. L. Mrazek.

The Faculty—Professor W. B. Day.

The Class of 1915—President H. L. Eberly.

The Class of 1890—Dr. Charles A. V. V. brecht.

Professor C. M. Snow presided as guest master. The occasion was a most enjoyable one and a fitting close for a most successful and largely attended Commencement.

## Societies

#### Related Association Meetings.

#### NATIONAL ASSOCIATION OF RETAIL DRUGGISTS.

The 1915 convention will be held at Minneapolis, Minn., August 30 to September 5. President, Samuel C. Henry, Philadelphia, Pa.; Secretary, T. H. Potts, Chicago, Ill.

#### AMERICAN ASSOCIATION OF PHARMACEUTICAL CHEMISTS.

The 1915 convention was held at Rochester, N. Y., in May. President, George C. Hall, New York; Secretary, E. L. Maltbie, Newark, N. J.

#### AMERICAN INSTITUTE OF CHEMICAL ENGINEERS.

The seventh semi-annual meeting will be held at San Francisco, August 23-28. President, George D. Rosengarten, Powers-Weightman-Rosengarten Company, Philadelphia; Secretary, John C. Olsen, Cooper Union, New York.

#### MANUFACTURING PERFUMERS' ASSOCIATION OF THE UNITED STATES.

President, A. M. Spiehler, of Adolph Spiehler, Inc., Rochester, N. Y.; Secretary, Frank L. Carpenter, of Lazell, Perfumer, New York.

#### NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION

The 1915 convention will be held at Santa Barbara, Cal., during September, the date to be fixed later. President, Charles A. West, Eastern Drug Company, Boston, Mass.; Secretary, Thomas F. Main, 81 Fulton Street, New York.

#### SECRETARIES OF BOARDS OF PHARMACY.

Alabama—E. P. Galt, Selma.

Arizona—Arthur G. Hulet, Phoenix.

Arkansas—J. A. Gibson, Little Rock.

California—Louis Zeh, San Francisco, Suite 909 Butler Building, 135 Stockton St.

Colorado—Wm. F. Thebus, Denver.

Connecticut—J. A. Levery, Bridgeport.

Delaware—J. O. Bosley, Wilmington.

District of Columbia—W. F. Kerfoot, Jr., Washington.

Florida—D. W. Ramsaur, Palatka.

Georgia—Chas. D. Jordan, Monticello.  
 Idaho, T. M. Starrh, Twin Falls.  
 Illinois—F. C. Dodds, Springfield.  
 Indiana—Burton Cassady, West Terre Haute.  
 Iowa—H. E. Eaton, Des Moines.  
 Kansas—W. R. Sheriff, Ellsworth.  
 Kentucky—J. W. Gayle, Frankfort.  
 Louisiana—Jos. T. Baltar, New Orleans.  
 Maine—Frank T. Crane, Machias.  
 Maryland, Ephraim Bacon, Baltimore, 30th and Calvert Sts.  
 Massachusetts—Albert J. Brunelle, Boston, 22 State House.  
 Michigan—Ellis E. Faulkner, Delton.  
 Minnesota—Edward A. Tupper, Minneapolis, 754 E. 14th St.  
 Mississippi—W. W. Ellis, Fernwood, Pike County.  
 Missouri—E. G. Cox, Craig.  
 Montana—W. R. Montgomery, Butte.  
 Nebraska—J. Earle Harper, Spencer.  
 Nevada—J. M. Taber, Elko.  
 New Hampshire—Herbert E. Rice, Nashua.  
 New Jersey—Henry A. Jorden, Bridgeton.  
 New Mexico—B. Ruppe, Albuquerque.  
 New York—W. L. Bradt, Albany, Edu. Bldg.  
 North Carolina—F. A. Hancock, Raleigh.  
 North Dakota—W. S. Parker, Lisbon.  
 Ohio—M. N. Ford, Columbus.  
 Oklahoma—J. C. Burton, Stroud.  
 Oregon—J. Lee Brown, Marshfield.  
 Pennsylvania—L. L. Walton, Williamsport.  
 Rhode Island—James E. Brennan, Pawtucket.  
 South Carolina—F. M. Smith—Charleston.  
 South Dakota—E. C. Bent, Dell Rapids.  
 Tennessee—Ira B. Clark, Nashville.  
 Texas—R. H. Walker, Gonzales.  
 Utah—Walter H. Dayton, Salt Lake City.  
 Vermont—Mason G. Beebe, Burlington.  
 Virginia—T. A. Miller, Richmond.  
 Washington—D. B. Garrison, Connell.  
 West Virginia—Alfred Walker, Sutton.  
 Wisconsin—Edward Williams, Madison.  
 Wyoming—R. A. Hopkins, Cheyenne.

&lt;&gt;

#### FLAVORING EXTRACT MANUFACTURERS' ASSOCIATION.

The next meeting of the Flavoring Extract Manufacturers' Association will meet in Cleveland, July 8-10. W. M. McCormick, of McCormick & Co., Baltimore; J. O. Schlotterbeck, of J. Hungerford Smith Co., Rochester, and Frank L. Beggs, of Styron, Beggs & Co., Newark, Ohio, were appointed a committee to make the necessary arrangements for the meeting.

#### OFFICERS OF PROPRIETARY ASSOCIATION OF AMERICA.

The following officers and members of the Executive Committee of the Proprietary Association of America were elected for the ensuing year, at their annual meeting held in New York City, May 11-13:

President, A. H. Beardsley, Elkhart, Ind.; First Vice-President, William H. Gove, Lynn, Mass.; Second Vice-President, Allen F. Moore, Monticello, Ill.; Secretary-Treasurer, Charles P. Tyrrell, Syracuse, N. Y., re-elected. Executive Committee, Joseph F. Hindes, Baltimore, Md.; R. R. Land, Binghamton, N. Y.; F. K. Hyde, Buffalo, N. Y.; Will A. Peairs, Des Moines, Ia.; Z. C. Patten, Jr., Chattanooga, Tenn.; Carl J. Balliett, Buffalo, N. Y.; Frank Blair, Chicago.

&lt;&gt;

#### MANUFACTURING PERFUMERS' ASSOCIATION OF THE UNITED STATES.

The Manufacturing Perfumers' Association of the United States met in New York City, April 27-29.

Resolutions were adopted by the members indorsing the Stevens bill for retail price maintenance on trade-marked and patented articles, also urging the enactment of a bill seeking to have the internal revenue tax on cologne spirits eliminated, and approving a proposal to affiliate with the Chamber of Commerce of the United States.

#### OFFICERS FOR 1915-1916.

A. M. Spiehler, of Adolph Spiehler, Inc., Rochester, N. Y., was re-elected President of the Association; S. S. West, of the Abner Royce Company, of Cleveland, Ohio, Vice-President, and Frederick F. Ingram, of the Frederick F. Ingram Company, Detroit, Second Vice-President; Walter Mueller, of A. A. Vantine & Co., New York, Secretary, to succeed Frank N. Carpenter, of Lazell, Perfumer, New York, and A. B. Calisher, of Calisher & Co., New York, was elected Treasurer.

Succeeding Theodore Ricksecker, D. H. McConnell and W. A. Bradley, as members of the Executive Board, the following were selected: D. H. McConnell, of Goetting & Co., New York; V. B. Thomas, of Harriett Hubbard Ayer, Inc., New York, and George R. Merrell, of Chicago.

Mr. Ricksecker was elected an honorary member of the Association.

Chairman Walter Mueller of the Committee on Importation and Undervaluation closed his report by stating that the raw materials used by the foreign and domestic perfumers come from the same sources. As much technical skill and ability are employed by the domestic as by the foreign manufacturers. Isn't it easily possible to educate the American public in the preferred use of the domestic perfumes? It is certainly well worth trying, especially now that conditions abroad favor us with every opportunity for expanding our business both at home and in foreign markets hitherto controlled almost exclusively by the European perfume makers.

### SUBJECTS FOR PAPERS.

The Committee on Papers and Queries of the Pennsylvania Pharmaceutical Association has sent out the following topics for papers. We reprint the list, believing that they will suggest subjects for papers to be presented to one or the other Sections of the A. Ph. A.:

- 1—There is a popular impression that preventive medicine has lessened prescribing by physicians; that drugs and medicaments are being supplanted by vaccines, sera, etc. Is this true?
- 2—On what basis are nurses entitled to discounts from pharmacists?
- 3—Open shop on the Sabbath Day. Necessity or greed?
- 4—Is the labor or the material the more expensive part of the average prescription?
- 5—Should the pharmacist dispense prescriptions containing poisonous substances without considering in his charge for the same the responsibility which rests upon him?
- 6—Do you consider the rebate check as clear profit or merely as a refund for overcharge on the cost of merchant disc?
- 7—A simple method is wanted for making, filling and sealing ampoules in the pharmacy.
- 8—More data is wanted from those who have employed women as clerks in pharmacies.
- 9—Wanted: A formula for a non-precipitating compound infusion of gentian.
- 10—What are the advantages of fat free tincture of digitalis over the U. S. P. tincture?
- 11—Do you know of anything better than chondrus to suspend silver iodide?
- 12—What is your system of keeping control on dates of biological and similar products?
- 13—Data is wanted on making "milk of magnesia" from calcined magnesia.
- 14—Is there any difference from a therapeutic standpoint between Russian petroleum oil and a fully refined Pennsylvania oil of the same specific gravity?
- 15—Wanted: Your experience in preparing perfumes from so-called concentrations.
- 16—What attitude toward your customers would you assume were a demoralizing cut-rate advertising drug store to invade your town?
- 17—On an average business of \$10,000 a year and an investment of \$5,000, what percent of gross profit would you figure as necessary to pay you an income of \$1,200, after all overhead expense was taken care of?
- 18—Wanted: Examples of methods employed by retail pharmacists in keeping records required under the Federal anti-narcotic law.
- 19—Is it inimical to the financial interests of the retailer if all medicinal preparations are required to be labeled in such manner as to reveal their composition?
- 20—How may the enforcement of the "Truth Advertising law" be useful to legitimate pharmacy?
- 21—Why should not a state law supplement the Harrison law?
- 22—Why will the Stevens bill never be placed on the statute books?
- 23—Are the N. A. R. D. and A. Ph. A. asleep at the switch—vide the Paige bill?
- 24—What benefit to the pharmacist will the Paige bill bring, if enacted?
- 25—When hard gelatine capsules are immersed in solution of formaldehyde, how is their solubility in the human body affected?

- 26—Wanted: A simple method for determining the cathartic principles of cascara sagrada.
- 27—Have you had any experience in using or selling para dichlor benzene?
- 28—Would an infusion of digitalis, made double strength as to drug and alcohol, to be afterward diluted, keep; would it be as active?
- 29—Literature on lime liniment as an ointment base is wanted.
- 30—What quality liquor calcis can be made from calcined dolomite?
- 31—How do the grocery store and drug store varieties of cream of tartar compare chemically; as to price wholesale and retail?
- 32—Value of newspaper advertising to the average drug store.
- 33—To what extent do people become habituated to the use of drugs not ordinarily considered habit forming?
- 34—How do the various brands of hydrogen dioxide on the market compare?
- 35—How can the microscope be made to pay for itself in the drug store?
- 36—What moral support are pharmacists giving toward the enforcement of anti-narcotic laws?

&lt;&gt;

## MARYLAND ASSOCIATION.

The Maryland Pharmaceutical Association will meet June 22-25 at Braddock Heights. T. M. Williams, of Frederick, the local Secretary, and W. L. Pierce, of Baltimore, Chairman of the Entertainment Committee, have prepared an interesting program. Among the entertainments provided will be a trolley trip to Hagerstown and an excursion to Harpers Ferry.

&lt;&gt;

## LOUISIANA PHARMACEUTICAL ASSOCIATION.

The Louisiana Pharmaceutical Association convened in New Orleans, May 11. Mayor Behrman welcomed the visitors and the response was made by E. H. Walsdorf, U. S. Revenue Collector. J. Y. Fountleroy explained the Harrison law, Attorney General Rufus Pleasant spoke of the pharmacists' influence as citizens, Dr. Philip Asher represented the American Pharmaceutical Association. The Stevens bill was unanimously favored.

The following were elected officers for the

ensuing year: F. A. Earhart, New Orleans, President; Charles McDonald, Port Allen, First Vice-President; Eugene H. Daste, New Orleans, Second Vice-President; George W. McDuff, New Orleans, Secretary, and J. T. Baltar, New Orleans, Corresponding Secretary. The Executive Committee: Peter Rupp, E. S. Bernadas, Joseph P. Walker, S. J. Peters and Marshall B. Castiex. Delegates to the American Pharmaceutical Association: F. C. Godbold, W. G. Hudson and Philip Asher, M. D.

The Executive Committee will select the place of the next meeting. Baton Rouge and Alexandria have extended invitations.

&lt;&gt;

## ARKANSAS ASSOCIATION.

The thirty-third annual meeting of the Arkansas Association of Pharmacists was held in Pine Bluff, May 11-13.

The election of officers for the ensuing year resulted as follows: Booker Latimer, of De Queen, President; W. T. Seawell, Pine Bluff, First Vice-President; A. G. Brown, Luxora, Second Vice-President; Miss Mary A. Fein, Little Rock, re-elected Secretary and Treasurer; J. S. Shields, Forrest City, Chairman of the Executive Committee.

The matter of the next meeting place was left with the Executive Committee. Little Rock and Texarkana both desire the 1916 convention. Texarkana druggists contemplate a joint meeting of the Arkansas and Texas Associations.

&lt;&gt;

## MISSOURI PHARMACEUTICAL ASSOCIATION.

The Missouri Pharmaceutical Association will hold the Thirty-seventh Annual Meeting at Pertle Springs, Tuesday, June 15, to Friday, June 18, inclusive.

President O. J. Cloughly has been active during the past year in the interest of the retail pharmacists. He will report the part taken by Missouri in defeating the proposed war tax on pharmacists.

Professor Francis Hemm, for many years the efficient Chairman of the Committee on Papers and Queries, is making every effort to have a variety of papers appealing to the interest and welfare of pharmacy in Missouri.

Dr. Leo Suppan, Historian, will report what has been accomplished in the way of assembling material pertaining to Missouri pharmaceutical history.

F. H. Fricke, Chairman of the Committee on Legislation, will have a pleasing report, inasmuch as the legislature adjourned without enacting bills detrimental to pharmacy.

Various other standing committees are at work and will submit timely reports.

The Missouri Pharmaceutical Travelers' Association, with J. J. Murphy as President, is looking after the entertainment features. Travelers' Day, as usual, will be celebrated Thursday.

The Missouri Board of Pharmacy will hold an examination Monday and Tuesday. Prospective candidates should communicate at once with the Secretary of the Board, Edwin G. Cox, Craig.

F. W. Robinson, Warrensburg, is the local Secretary and has charge of all arrangements at that end of the line.

As usual, delegates will be in attendance from neighboring state pharmaceutical associations.

H. M. WHELPLEY,  
Permanent Secretary.

<>

#### KANSAS PHARMACEUTICAL ASSOCIATION.

The Kansas Pharmaceutical Association met in Wichita, May 11-13. Including the families of members, nearly 700 were in attendance. More pharmacy and less of the restaurant idea was advocated. Reform in the drug store was the keynote of an address by J. S. Chism, who spoke for making the business more attractive to better educated young men, who objected to the needlessly long hours. The Stevens bill was endorsed and a strong resolution passed encouraging the authorities in the rigid enforcement of liquor laws.

W. J. Bangs of Madison was re-elected President of the Association; E. E. Bloom, Hutchinson, First Vice-President; B. C. Culp, De Soto, Second Vice-President; D. von Riesen, Marysville, Secretary; J. M. Brunt, Topeka, Assistant Secretary; J. Schmitter, Gypsum, Treasurer, re-elected, and Professor L. E. Sayre, Lawrence, Librarian, re-elected.

J. Floyd Telford of Wichita was elected Chairman of the Executive Committee; the other members are: R. B. Bird, Winfield; Harry Dick, Lawrence; Edward Dorsey, Ottawa; C. C. Reed, Salina.

The next meeting of the Association will be held in Kansas City, May, 1916.

### The Pharmacist and the Law

#### NEW IOWA LAWS.

The Iowa Association bills that were passed by both houses and are now part of pharmacy laws are:

The Brammer-Jackson bill amends the Pure Drug act so that everybody handling drugs or medicines (including the doctors) must comply with its provisions and be subject to inspection by the pharmacy commission.

The Becker-Taylor bill amends the present pharmacy law so that the State Board can prosecute violations of the pharmacy laws without having to prove a specific sale in each and every case. Convictions under the old law were difficult to obtain because of lack of evidence.

Anti-Narcotic legislation was secured by amendments to different selections of the present statutes. Illegal sale and use by those licensed under the National Act are taken care of under the unprofessional conduct and injunction acts.

The Pharmacy Board has been placed on a salary basis and the state has been divided into three districts, with one member of the board in each of the districts and responsible for the enforcement of the pharmacy laws in his district.

An appropriation has been secured from the state for equipping a laboratory for the use of the board.

<>

#### NEW JERSEY NEW ANTI-NARCOTIC LAW.

The New Jersey Anti-Narcotic Law (Ostrom Act) makes it a misdemeanor to sell, give away, except upon the prescription of a duly registered physician, and also to have in one's possession any cocaine, beta-eucaine, alpha eucaine, tropocaine, novocaine, stovaine, alpin or any salt, derivative or chemical compound of any of these substances or any preparation, admixture or compound containing any of them, or their salts, derivatives or chemical compounds, or chloral hydrate, opium, morphine, codeine, heroin, ethyl morphine (dionin), diacetyl morphine (heroin), or any salt, derivative or chemical compound of such substances.

## AMENDED NEW YORK ANTI-NARCOTIC LAW.

The New York Anti-Narcotic Law conforms to Harrison law as to amounts of exempted narcotics; permits the refilling of prescriptions calling for the exempted amounts of narcotics; words the directions for filing prescriptions in accordance with the Harrison law; permits use of the federal narcotic order blanks instead of state blanks now demanded; compels a physical examination of the patient by the physician before the latter prescribes or dispenses the narcotic; modifies the clause providing for the legal commitment of an addict; and makes the dispensing of narcotics to children under sixteen years a felony.

## OHIO LEGISLATION.

The Platt Law as it may now be called, since there is little doubt of the Governor's approval, places the enforcement of the laws with the State Board of Pharmacy or its Secretary. Substantially with reference to Narcotic Legislation it is an enactment of the so-called Duffey Act changed, only, in that it exempts also preparations which do not contain more than one grain of codeine to the fluid or solid ounce. In this respect a new provision has also been added under which habitual users of narcotics may be examined by a physician appointed by the Probate Judge, and upon certificate issued by such physician, any physician licensed under the laws of Ohio is then authorized to prescribe such drugs for habitual users. The certificate is to be in force for such purpose for a period not to exceed ninety (90) days. The provision is of very doubtful value and is certainly an interference with the practice of legitimate physicians such as has never been contemplated by pharmacists.

With reference to the Poison Law feature of the Platt Bill, it simply places with the Board of Pharmacy the enforcement of the existing Poison Law.

The White Bill, which has also been enacted in the Legislature and which awaits the action of the Governor, provides for a prerequisite in the way of general education and graduation from a College of Pharmacy. The new law will not become operative until 1917.—From report of the Committee on Legislation to the Cincinnati Branch, A. Ph. A., by Chairman F. H. Freericks.

**Necrology**

## THOMAS F. RAYMOW.

Thomas F. Raymow, a member of the Faculty of the Brooklyn College of Pharmacy, serving as lecturer in pharmaceutical Latin and instructor in pharmacy and drug assaying, died of heart disease on April 12, 1915, at the age of thirty-six, at his residence in Flatbush. Until November of last year, Professor Raymow conducted a retail drug store at Beverly road and Coney Island avenue, Brooklyn, when he sold out in order to devote his entire time to teaching and laboratory work. He was active in pharmaceutical affairs, being a member of the Kings County Pharmaceutical Association, of the New York State Board of Pharmacy, and of the American Druggists' Syndicate. He joined the American Pharmaceutical Association in 1913. He is survived by a widow and two children.

J. W. E.

## WILLIAM H. WOOD.

William Henry Wood, President of the Maine Pharmaceutical Association, and one of the best known pharmacists in the Pine Tree State, died at his home in Sanford, Maine, on May 19, 1915, after an illness of several months.

Mr. Wood was born in Windham, Me., December 20, 1872. He received his early education in the public schools of Windham, and graduated from the Gorham High School. He then took a course in a business college and later entered the drug store of B. L. Stanwood of Portland as a bookkeeper. Here he made a study of the drug business and decided to make it his life work. In 1895 he went to Springvale and bought the drug store of Dr. B. M. Moulton. Mr. Wood received his collegiate education in the Buffalo School of Pharmacy, graduating in 1899. In the big Springvale fire of April 15, 1905, Mr. Wood's store was destroyed. He opened a small store in one of the first buildings erected in the city after the fire, but soon sold out to L. B. Trafton, and accepted a position as clerk in a Boston drug store, and later, Mr. Wood conducted a drug store at Beverly, Mass., but soon sold this and on December 1, 1908, bought the drug store of Charles A. Trafton in Sanford, which he built up into a most successful business.

Mr. Wood was elected President of the Maine Pharmaceutical Association at Bangor in 1914, and the choice was a most popular one. He served on various committees of the Sanford Board of Trade, and last year was president of that body. He was town clerk of Sanford from March, 1901, to March, 1902. He served several years on the Republican Town Committee prior to the campaign of 1912, when he joined the Progressive Party. He was a member of the Unitarian Church and was active in the organization of this church in Sanford. He was a member of the Springvale Lodge, No. 190, F. & A. M., White Rose Chapter, of Royal Arch Masons, Fluellen Tribe, I. O. R. M., Mousam River Lodge, K. of P.; and Washington Council, J. O. U. A. M.

Mr. Wood was married on Christmas day, 1895, to Miss May Weymouth of Portland, Me., who survives. He is also survived by his mother in Windham, and a brother, Bert Wood, of Boston.

J. W. E.

FRANK D. MORSE.

Frank Dana Morse, of Portland, Me., died in that city on March 30th. Mr. Morse was born in Portland in 1873, was an honor graduate of the New York College of Pharmacy, and was connected with H. H. Hay Sons, the well-known drug firm of Portland, for twenty years. Mr. Morse was unmarried; he is survived by two sisters.

He became a member of the American Pharmaceutical Association in 1902.

J. W. E.

Council Business

COUNCIL LETTER No. 20.

Philadelphia, Pa., March 19, 1915.

To the Members of the Council:

Gentlemen: The following communication has been received:

"Members of the Council:

Gentlemen: Bids for the composition, printing and binding of the Year Book, 1915, (Volume 2), were invited from the J. B. Lippincott Co. of Philadelphia, the Stoneman Press Co. of Columbus, Ohio, W. J. Dornan of Philadelphia, and the Eschenbach Printing Co. of Easton, Pa.

The Committee on Publication made a careful examination of the bids and found that the two lowest bidders were the Stoneman Press Co. and the Eschenbach Printing Co.,

and these companies were then asked to submit a tentative estimate of cost based on three thousand copies of the book, having 300 pages of 10 point leaded composition, 100 pages of 8 point leaded composition, and 50 pages of 6 point leaded composition, and paper, printing and binding as per copy, in accordance with the terms and conditions set forth in specifications furnished.

The paper in the original bids was specified as 24 x 38, 65 pound, 480 sheets to the ream, and this being heavier than the 1912 Year Book, these firms were asked to name the allowance that would be granted if 25 x 38, 60 pound, 480 sheets to the ream paper was used instead. The estimates submitted were as follows:

STONEMAN PRESS CO.

For your information we submit the following:

300 pages, 10 point, leaded 2 point	
@ 68c per page.....	\$204.00
100 pages, 8 point, leaded 2 point	
@ \$1.00 per page.....	100.00
50 pages, 6 point, leaded 2 point	
@ \$1.65 per page.....	\$82.50
Difference between 6 point leaded and solid per page.....	.60

The above item, and items of tabular matter, figure work, brace work, and formulas, cannot be determined until after completion of the book.

3000 copies, 450 pages, no composition, including paper, press proofs of galleys, make-up, press work, wrapping and cartons, binding, labeling (labels not addressed by us) ready for delivery f. o. b. Columbus to authorized agent of the Association for .....	1350.00
---	---------

\$1736.50

If 25 x 38, 60 pound paper is used, instead of 25 x 38, 65 pound paper, the following allowance will be made: 450 pages, \$20 (same rate for more or less pages).

ESCHENBACH PRINTING CO.

Assuming the following estimated number of pages of the three kinds of composition, 3000 copies of your book will cost according to the above figures as follows:

300 pages 10 pt. leaded composition .....	\$0.82	\$246.00
100 pages 8 pt. leaded composition .....	1.01	101.00
50 pages 6 pt. leaded composition .....	1.78	89.00
Paper, printing and binding per copy .....	.375	1125.00
		\$1561.00

The substitution of a 25x38, 60 pound paper for the sheet you have specified which is equivalent to a sheet 25x38=70 you will save \$32.00 from the above figures. The chief saving, however, would be in postage and express rates.

The price quoted above includes the cost of

wrapping and furnishing of cartons ready for mailing or expressage, but does not include the addressing and stamping; this will cost 1 cent per copy additional.

From this data, it is evident to your Committee on Publication that the bid of the Eschenbach Printing Co. is \$172.50 less than the bid of the Stoneman Press Co. for the *heavier* paper, and \$185.50 less for the *lighter* paper, and the Committee therefore decided, subject to the approval of the Council, to award the contract to the Eschenbach Printing Co. as the lowest bidder.

With reference to the facilities of the Eschenbach Printing Co. for handling the work, it may be stated that this company prints the "Journal of the American Chemical Society," "Chemical Abstracts," and "The Journal of Industrial and Engineering Chemistry," published by the American Chemical Society, and with reference to the character of their work and service, Charles L. Parsons, Secretary of the American Chemical Society, writes us as follows:

"I will state that the Eschenbach Printing Co. have done faithful and prompt work for the American Chemical Society. We have several times revised our contract and put out bids to other firms, but in every instance have gone back to the Eschenbach Printing Co. during recent years. We have only good words for the service they have rendered to us. Proofs have always been sent in promptly, and they have, I think, one of the most efficient proof readers in the country. I am very glad that I can give this favorable report."

The Secretary of the Columbia University of the City of New York writes:

"The Eschenbach Printing Co., of Easton, Pa., has done a great deal of work for us in the past few years, and we have found them very satisfactory."

Very truly yours,

J. W. ENGLAND,

Chairman of the Committee on Publication.

Do you approve of the action of the Committee on Publication in awarding the contract for printing the 1913 Year Book (Volume 2) to the Eschenbach Printing Co. of Easton, Pa.? This will be known as *Motion No. 34 (Approval of Action of Committee on Publication in awarding the contract for printing the 1913 Year Book (Volume 2) to the Eschenbach Printing Co., of Easton, Pa.)*.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

<>

#### COUNCIL LETTER No. 21.

Philadelphia, Pa., March 30, 1915.

To the Members of the Council:

Gentlemen—*Motions No. 32 (Appropriation of \$100 from Centennial Fund for Research*

*Work on Medicinal Plants, etc.)*, No. 33 (*Election of Members; Applications Nos. 88 to 101, inclusive*), and No. 34 (*Approval of Action of Committee on Publication in Awarding the Contract for Printing the 1913 Year Book (Volume 2) to the Eschenbach Printing Co., of Easton, Pa.*), have each received a majority of affirmative votes.

The following communication (March 17) addressed to the Council, from E. G. Eberle, of Dallas, Texas, has been received:

"I am advised of my election as Editor of the Journal of the American Pharmaceutical Association.

I feel assured that the Council members have voted their conclusions relative to that which they deemed for the best interests of the Association.

Aside from presenting my application, the only effort put forth by me was to assure them that these were my views and that I would accept their judgment, whatever that might be, accordingly.

I now desire to thank the Council for the honorable and responsible position conferred upon me, and inform them that I will exert my best efforts for the Association and in serving the membership.

In connection with the subject of program for the next annual meeting of the Association, W. C. Alpers writes:

"I would like to make the following suggestion in reference to the program of our next meeting. Ever since the present method of electing officers of the Association has been in use, complaints have been made that the installation of the new officers is not conducted properly. In former years this installation was one of the most pleasant and dignified parts of the meeting. Everybody looked forward to it with pleasure and some of the nicest speeches of our records were made on that occasion. I would suggest that the former method of installation be revived and that a fixed hour be set for it, and therefore propose that the program be changed so that after the line: 10:30 A. M., Final General Session (Friday), the following be inserted. 12 M., Installation of Officers."

The "Tentative Program for the Sixty-third Annual Meeting" adopted provides for, on Friday, August 13, the "Final General Session" at 10:30 A. M., and an "Adjourned Final General Session" at 1:30 P. M. The "Installation of Officers" in the past has generally been the final act of the final session. If Dr. Alper's suggestion is approved by the Council it might be well to make the hour at the time of the Adjourned Final Session (1:30 P. M.) instead of noon.

The following communication from T. A. Miller, President of the National Association:

of Boards of Pharmacy, to the Secretary of the Council has been received:

"Replying to your letter of the 18th inst., in regard to the program, will say that at our meeting of the Executive Committee held in Washington last week, and also a conference with similar committees from the Conference of Pharmaceutical Faculties, we decided that we would hold our meeting on Thursday, Friday and Saturday preceding the meeting of the A. Ph. A. so that it would not be necessary to hold any dates open during the meeting of the A. Ph. A. If you would transmit this to the Council and thank them for the courtesy that they have been extending to us, I would appreciate it very much."

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

#### COUNCIL LETTER No. 22.

Philadelphia, Pa., April 10, 1915.

To the Members of the Council:

Gentlemen—Motion No. 31 (C. L. No. 18, 62) having been approved by the Council and Mr. Eugene G. Eberle having accepted election as Editor and Advertising Manager, arrangements were made whereby he assumed the duties of the office on April 6, 1915, at Columbus, Ohio. It was at first thought possible that Mr. E. C. Marshall might be released on April 1, to comply with his expressed wish to be relieved from active duty as soon as possible. Mr. E. G. Eberle beginning service April 1. But Mr. Eberle could not reach Columbus until April 6, and Mr. Marshall remained in charge of the Journal until Mr. Eberle's arrival.

The Committee on Publication recommend to the Council that, as Mr. E. C. Marshall was relieved from duty on the Journal by Mr. E. G. Eberle on April 6, Mr. Marshall be paid for one week's service in April, and be given three weeks' vacation with pay from April 7, at the same rate of salary he has been receiving as Acting Editor.

Very truly yours,

J. W. ENGLAND,

Chairman of Committee on Publication.

Do you favor the above recommendation of Committee on Publication? It will be known as *Motion No. 35 (Payment for Mr. Marshall's Services and Vacation)*.

*Motion No. 36 (Election of Members).* You are requested to vote on the following applications for membership:

No. 102. Herbert Ninian Beall, 1525 Connecticut Ave., N. W., Washington, D. C., rec. by Samuel L. Hilton and H. E. Kalusowski.

No. 103. Francis Joseph Pernusse, 2740 Arlington Ave., Lincoln, Neb., rec. by Rufus A. Lyman and Elsie Day.

No. 104. Albert John Martin, 2230 Oregon Ave., St. Louis, Mo., rec. by Glenn A. Burkart and Theo. C. Hagenow.

No. 105. Henry Louis Jerger, Jr., Broad St., Thomasville, Ga., rec. by R. Thomas and W. B. Day.

No. 106. Anthony C. Cost, 18 South Market St., San Jose, Cal., rec. by N. A. Pellegrano and Wm. B. Day.

No. 107. William Robert Englert, 407 Commercial St., Elko, Nevada, rec. by W. B. Day and J. M. Taber.

No. 108. James Frank McGogy, 4727 Brooklyn Ave., Seattle, Wash., rec. by C. W. Johnson and Edith Hindman.

No. 109. Dr. Joila Estrella Delgado, Jagney Grande, Province of Mantanzas, Cuba, rec. by Jose P. Alacan and Jose Guillermo Diaz.

No. 110. Mattys Jongeward, 154 A St., N. E., Washington, D. C., rec. by W. B. Day and J. W. England.

No. 111. Henry Otto Haecusgen, Anchorage, Ky., rec. by Oscar C. Dilly and Arthur L. Sicter.

No. 112. Rudolph Victor Miersch, 1132 W. Broadway St., Louisville, Ky., rec. by Oscar C. Dilly and Arthur L. Sicter.

No. 113. Gordon Laten Curry, 104 W. Chestnut St., Louisville, Ky., rec. by Oscar C. Dilly and Arthur L. Sicter.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

#### COUNCIL LETTER No. 23.

Philadelphia, Pa., May 1, 1915.

To the Members of the Council:

Gentlemen—*Motion No. 35 (Payment for Mr. Marshall's Services and Vacation)*, and *No. 36 (Election of Members; Applications Nos. 102 to 113, inclusive)*, have each received a majority of affirmative votes.

The following communication has been received from General Secretary Day:

"I have been in correspondence with five or six parties in regard to the stenographic report of the 1915 Convention. I have selected Lenhardt & Co. of Chicago as a firm of reliable stenographers who have made the lowest bid and who apparently can offer the best service. This is a Chicago firm, but will maintain offices in San Francisco during the summer and will be in a position to take care of our work satisfactorily.

"The offer of Lenhardt & Co. is as follows:

To furnish two stenographers for	
five days each.....	\$ 75.00
estimated 500 pages of transcript at	
40c a page.....	200.00

Total ..... \$275.00

"A page of transcript includes approximately 250 words.

"We have paid for reporting the Convention at Detroit \$379.18. I desire to have permission of the Council to let the contract for

reporting the Convention to Lehnhardt & Co."

Do you favor award of above contract? This will be known as *Motion No. 37 (Award of Contract for Reporting 1915 Annual Meeting, A. Ph. A., at San Francisco)*.

The following report has been received:

Camden, N. J., April 10, 1915.

To the Members of the Council of the American Pharmaceutical Association:

Gentlemen—In compliance with the directions of the Council, I have sent to the Editor for publication in the Journal, monographs on the following topics, and submit the list of these monographs to the Council as a record of the progress in the work of the Committee on Unofficial Standards.

Respectfully submitted,

GEORGE M. BERINGER,  
Chairman.

Alumini Chloridum	Chimaphila
Alumini Sulphas	Chirata
Antomonii Oxidum	Condurango
Antimonii Sulphidum	Conium
Purificatum	Convallaria
Berberis	Crocus
Bismuthi Citras	Cupri Sulphas
Brayera	Cypripedium
Bromum	Eupatorium
Calci Phosphas	Euonymus
Præcipitatus	Extractum Carnis
Calendula	Fæx Compressa
Cassia Fistula	Ferri Hypophosphis
Cataria	

*Motion No. 38 (Election of Members)*. You are requested to vote on the following applications for membership:

No. 114. Washington Hayne Zeigler, 213 Rutledge Ave., Charleston, S. C., rec. by E. A. Ruddiman and Wm. B. Day.

No. 115. Harry F. J. Guenther, 6430 St. Clair St., Cleveland, Ohio, rec. by Eugene R. Selzer and H. M. Whelpley.

No. 116. Milton M. Taylor, 602 Franklin St., Tampa, Fla., rec. by E. Berger and D. W. Ramsaur.

No. 117. Carlisle Laughlin, 2032 Bancroft Way, Berkeley, Cal., rec. by J. H. Beal and Albert Schneider.

No. 118. Maud Lambert, Ph. G., Franklin Road Pharmacy, Roanoke, Va., rec. by Ernest L. Brandis and Albert Bolenbaugh.

## WAR DEPARTMENT.

List of changes of stations covering period ending March 31, 1915, in the cases of Sergeants First Class, and Sergeants, Hospital Corps.

### SERGEANTS FIRST CLASS.

William F. Coleman, from the U. S. Disciplinary Barracks, Leavenworth, Kan., to the 2nd Division for station.

Frank Holt, from the Philippine Department, to the U. S. on furlough.

John R. Behre, from the Philippine Department, to the U. S., on furlough.

Nealey Prater, from the Philippine Department, to the Presidio of Monterey.

### SERGEANTS.

James J. Johnson, from the Transport "Sumner," to the U. S. Mine Planter Gen. Royal T. Frank.

Halbert M. Beasley, from the transport "Kilpatrick," to the Attending Surgeon's Office, Port of Embarkation, Galveston, Texas.

Joseph Alston, from the Presidio of Monterey, to Field Hospital Company No. 2.

Charles H. Dabbs, from the Department Surgeon's Office Eastern Department, to the Philippine Department.

Otto F. Van Buren, from the Presidio of San Francisco, to Ft. Lawton.

Albert C. Calish, from Ft. Lawton, to the Presidio at San Francisco.

Frank W. Chamberlin, from Field Hospital Company No. 3, to Ambulance Company No. 8.

George H. Spicer, from Ambulance Company No. 3, to Ambulance Company No. 8.

James L. Wood, from Ft. H. G. Wright, to Ft. Terry.

Robert E. L. Rogers, from the Philippine Department, to Ft. Monroe.

Charles Wood, from the Philippine Department, to the U. S. Disciplinary Barracks, Ft. Leavenworth, Kan.

Walter S. McWhorter, from the Philippine Department, to Jefferson Barracks.

Sebald J. Fichtner, from the Philippine Department, to the U. S., for discharge.

Ernest Arias, from the Philippine Department, to the Letterman General Hosp.

William Q. Fancher, from the Philippine Department, to the U. S. for furlough.

Charles N. Abel, from the Philippine Department, to Ft. DuPont.

Harry Cook, from the U. S. Disciplinary Barracks Ft. Leavenworth, to Washington Barracks.

Arthur M. Spencer, from Ft. Liscum, to Ft. Lawton.

John A. Baker, from the Walter Reed General Hospital, to Field Hospital Co. No. 5.

## NATIONAL COMMITTEE ON THE PHARMACEUTICAL SYLLABUS.

### BULLETIN IV.

F. G. Eberle has been appointed editor of the Journal of the American Pharmaceutical Association and requests, for use as frontispieces in the Journal, the plates of portraits of deceased pharmaceutical workers that were prepared for the Syllabus but not used. The Secretary has sent the plate of A. B. Prescott to Mr. Eberle, as requested, for use in the May number of the Journal and the following motion is submitted to the Committee:

Motion 274, by F. G. Eberle, seconded by T. J. Bradley:

That the Journal of the American Pharmaceutical Association be permitted to use the Committee's plates of portraits of deceased pharmaceutical workers.

## Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,  
From 2342 Albion Place, St. Louis, Mo.  
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or *type-written*.

## EMLLEN PAINTER

Elected President of the American Pharmaceutical Association at the  
San Francisco Meeting in 1889. Died before the expiration  
of his term of office, January 10, 1890.

EMLEN PAINTER  
1844-1890  
Thirty-seventh President of the  
American Pharmaceutical Association

# The Journal of the American Pharmaceutical Association

Volume IV

JULY, 1915

No. 7

Office of Publication, 63 Clinton Building, Columbus, Ohio.

Subscription, \$4.00 per annum, within the United States. To Canada, \$4.35. To other foreign countries in Postal Union, \$4.50 per annum. Single copies, 35 cents.

Entered at the Postoffice at Columbus, Ohio, as Second-Class matter.

Papers and communications for insertion in the JOURNAL should be sent to the Editor, E. G. Eberle, 63 Clinton Bldg., Columbus, Ohio. Subscriptions should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

The Association does not accept the responsibility for the opinions of contributors. Offensive personalities must be avoided.

## Emlen Painter

Emlen Painter was elected president of the American Pharmaceutical Association at the San Francisco meeting in 1889, and laid down life's burdens January 10, 1890, therefore was not permitted to preside in convention.

The frontispiece seems to us appropriate, in view of the fact that the American Pharmaceutical Association convenes again in San Francisco after the lapse of a quarter of a century; the president elected at that meeting was identified with pharmacy of the East and West.

The subject of this brief sketch was born at Concord, Pennsylvania, in 1844, educated in Wilmington, Delaware, and graduated from the Philadelphia College of Pharmacy, with honors, in 1866. The following year he came to San Francisco, accepting a position with H. P. Wakelee. In 1867 the firm of Painter and Calvert was established and continued for ten years, when the partnership was dissolved, Mr. Painter retaining the store at the corner of Clay and Kearney; later he opened several other stores, all of which he successfully conducted.

His name is closely associated with the founding of the California Pharmaceutical Society and the College of Pharmacy. To the latter he gave of his time for many years and with his co-laborers had the satisfaction of seeing the school develop into an institution of importance to pharmacy.

Mr. Painter returned to Pennsylvania for rest when his health began to fail, and thereafter decided on making his future home in New York City. Here he purchased the pharmacy of John Sheddon, at Broadway and Thirty-fourth streets, and under his management the business prospered. Mr. Painter became identified with the New York College of Pharmacy, was elected one of the trustees and Chairman of the Board of Examinations. He was one of the editors of the National Formulary.

In the fall of 1889 Mr. Painter disposed of his business on account of impaired health and had departed for the South, when increasing feebleness persuaded him to return to his home at Spuyten Duyvil, N. Y., where the final summons came January 10, 1890.

Professor P. W. Bedford, in speaking of Mr. Painter, paid this tribute: "He was a man of remarkable activity, of honest, earnest opinions, and when satisfied that he was right, he was not to be swerved by motives of either opposition or any other cause. He pursued what he believed to be right to the end."

## Contributed and Selected

### A PROPOSAL FOR THE ELEVATION OF THE PROFESSION OF PHARMACY.\*

C. F. NELSON, PH. D.

That Pharmacy, as it exists today, is not a profession in the sense that law, medicine and dentistry are, I think we are all, at the outset willing to admit. That it is, on the other hand, more than a business pure and simple seems equally evident. The Pharmacist thus appears in society in a double role,—he is a professional man and he is a business man—many say he is neither.

There are many reasons why this condition exists,—why it has been necessary for the pharmacist in America to become much of the tradesman; to step down, as it were, from a full-time professional schedule to that of half-time merchant and half-time pharmacist. But it is not my purpose to discuss with you at this time. I desire rather to invite your attention to another, and, as it seems to me, a far more important aspect of this subject, namely: Must pharmacy always occupy this middle ground,—stand aloof from the professions on the one hand and apart from the domain of business on the other? Why should this anomalous condition continue? Must the pharmacist always straddle the fence,—one leg in professional soil, the other on *business* territory? Must he always stand in the middle of the Rubicon, and, as Daniel Vorhies Pike, the Kokomo lawyer in the "Man from Home" put it, "Get hell from both sides?"

The old professional ideal in pharmacy is dead. It died with the advent of the modern pharmaceutical house. We should not try nor should we desire to bring it back. We must set our eyes towards a newer and better light and follow in its path as our fathers before us followed in theirs.

When I was a boy of fourteen, my father apprenticed me to a stern and exacting member of the old school,—a man who believed that anyone who did not make all of his pills, plasters, ointments, tinctures and even fluidextracts was unworthy of the name of pharmacist. I have vivid recollections of the old back-room where all of this "pharmaceutical cooking" went on; of the big black kettle in which we made our lead plasters; of the large percolators for making fluid-extracts of sarsaparilla; of the way we rubbed and rubbed to incorporate the mercury with the lard in preparing mercurial ointment; of the hours spent in coating pills with balsam of tolu dissolved in ether,—but, as I look back on it all now, I can see the many crudities and imperfections that crept in in spite of our professional zeal and care. We had no way of determining the purity of the ingredients used in making our preparations; no means, except purely physical

\* Read at a recent meeting of the Kansas Pharmaceutical Association.

ones, for testing the strength of the completed product; no machinery to make our pills round and mechanically perfect. We were, in other words, compounding of our own products and, therefore, professional enough but very inefficient as measured by modern methods.

The history of economics offers us a striking illustration of the futility of clinging to antiquated ideals. We are all familiar with the fact that the introduction of modern machinery revolutionized industrial conditions, bringing about disruption of the old trades. Society had to reorganize itself to meet the new conditions. Much hardship had to be undergone; many were the bitter denunciations of the new regime. And yet it prevailed.

The guild of stone cutters vowed eternal vengeance on the new machinery which cut stones better and faster than they could—they would have none of them; their old methods were the best, they wanted their old trade to be as it always had been and yet,—the machine prevailed.

Woman, who had up to this time always worked in the home, was with remarkable rapidity thrust out of that shelter and put into the factory; again the age prevailed, society could do nothing to prevent it.

There are many pharmacists who cling fondly to the old ideal of preparing most of their own preparations. In a measure the pharmacist must always do some of this, but it is futile for him to attempt to compete with the modern manufacturer in the preparation of an ever increasing number of pharmaceutical preparations. The manufacturer has at his command the purchase of the best drugs at the cheapest prices. He can make a preparation faster and, therefore, more cheaply. By working with large quantities he can subject it to a number of rigid checks to insure its absolute accuracy. In short, with his machine he can make a better product more easily than the retailer can without machinery.

If then, we are ready to admit that the old standards and ideals are outworn, useless because times have changed, we are ready to ask, Are there any new ones to take their places? Is there a set of new ideals for the modern pharmacist which will prevail in the present age, which will place him in the ranks of the professional man where he really belongs? I think there is, and, while a complete solution of the problem is not at hand, there are many avenues of light, some of which the present generation may only behold, and not walk in, while others are open for his progress, if he has faith enough and the strength to believe in himself and the willingness to turn conviction into action.

A profession remains a profession because in the long run—in terms of decades, its members perform a real service to society. The pecuniary reward for professional service is after all secondary. A specialist must first of all be desirous of curing his patient; of being interested in the case for itself. If he have only the desire to make a profit he soon fails.

Much of modern business today has become infused with this professional ideal of service. Many business men look upon their establishments as places where the public can be served—"After we have served you we will speak of the reward." The pharmacist was probably the first store-keeper to carry out his ideal. He "served better than he knew" when he first introduced the sale of postage stamps; when he put a telephone in a convenient place in his store for

the use of his customers, only to bother him; when he bought a city directory for the use of all and even furnished scratch paper free of charge. Many will say he did it to draw trade. (If there is much trade drawn in that way his competitors would soon have found it out.) No, he did it because he had a good heart; because, way down in him was the mouldering desire to be of service. He showed that he had the professional ideal. Here was humble service to be sure, but service it was. Something for nothing was the unformulated and latent slogan within him, but it was still there.

If you agree with me then that the pharmacist has within him the true professional desire of service, let us ask are there no larger and richer fields open to him in modern life? Can he not aspire to the plane of the physician and the lawyer and still remain in his chosen calling? Must he be content to sell postage stamps, furnish telephone and city directory to the people of his community or can he enlarge his sphere of action and in so doing also reap his due pecuniary professional rewards?

To those who follow the trend of modern medicine, nothing is clearer than that clinical diagnosis is becoming more and more subject to chemical and bacteriological analyses. The mere recital of symptoms by the patient does not satisfy the up-to-date physician. He is finding it increasingly necessary to check this information by actual chemical and bacteriological data. It is precisely here where the pharmacist can become the physician's colleague. Can give advice and help as a bacteriological and chemical expert, can aid in important diagnoses and thus earn the lasting respect of the individuals of his community. Precisely here, can the pharmacist take his place beside the physician as a real professional man and with him help in the elimination of pain and suffering. There are hundreds of things the physician wants to know which the pharmacist could answer if he only would, e. g., What does this urine contain? Are there any tubercular bacilli in this sputum? Does this throat swab contain the germs of diphtheria? Is this blood serum positive or negative for typhoid fever or syphilis?

All of these questions should be answered daily, many times during the day, but there is no one now to do it because the physician has neither the time nor the necessary equipment, nor even the technique for that matter, to carry out all of these tests. I think it a conservative statement to say that in most communities there is today a latent demand for at least 500 Widal tests for typhoid fever each year. And as we shall see later, the demand for analytical work does not begin to stop here.

We are living in an age of standardization, everything under the sun is being standardized; medical schools, law schools, schools of pharmacy, cities of the first class, cities of the second class, pure milk, ice cream, lemon extract and spirit of camphor. Many of these you see call for the services of a chemical analyst. We are also ever increasingly in need of the services of the analyst in our every-day life; to see that the products we buy are what they claim to be and to satisfy ourselves that the products we manufacture and sell meet with the required standards; an ever-increasing number of manufacturers, business men and private citizens need to have materials constantly analyzed. Here

again there is a vast latent demand waiting only for some one to do it; this milk man wants his milk tested; this ice cream manufacturer his cream, probably his sugar. A baker would gladly pay for an analysis of a flour he bought in large quantities, or his egg powder, or his cooking oil. A manufacturer wants to know if the water he uses is suitable for use in his boilers, or if the coal he bought is what he contracted for. All of this work is truly professional in character. The pharmacist already has his store, his chemicals, his chemical training; and he is therefore the logical man to undertake it. If he rises to the occasion he cannot fail to advance himself, at the same time to elevate the character of his profession.

I have tried to show that there is a vast latent demand in every community for real analytical work of a chemical and bacteriological character, and that the pharmacist, by reason of his training and equipment, is the logical man to undertake it. I have also tried to point out that if he does attempt this work he will pull his profession upwards with him. The matter may probably be summed up in this manner. The modern pharmacist should be not a "pharmaceutical cook" whose ideal lies in making a few galenical preparations, but first of all a "prescription specialist," a man who understands how to compound a prescription accurately and scientifically, who can determine and check the purity and strength of the ingredients that enter into it by chemical and biological methods; and, in the second place, he should be a chemical and bacteriological expert to help the physician diagnose his cases; to help the manufacturer and the private citizen solve their chemical problems. He should be able to run for the office of city chemist and city bacteriologist. We don't have many such men in Kansas as yet, but we will have, and soon.

The time then seems ripe for the establishment of at least small analytical laboratories in connection with our drug stores, not excepting even those in very small communities. The beginnings may be small and modest. The outlay in money need be very slight. One may choose to specialize on only a few kinds of analyses at first, say, examination of throat swabs, sputum analyses, or Widal's test for typhoid fever, and then gradually widen out as one's experience grows. The druggist is always wanting to put in new side lines to improve his business. Certainly a departure of this sort would be valuable as a money maker after it was worked up, and it would do much to elevate the profession as a whole.

The laboratory should occupy a prominent place in the front part of the store. It may thus be made to pay for itself as an advertising medium. To say that it will improve the looks of a store more than the modern soda water fountain needs no argument. The effect it will have on the physician and also on the trade seems obvious. That it can be made profitable in most cases looks equally evident. What expense will be involved in the establishment of such a laboratory? To answer this question we must of course know on how large a scale we wish to operate. But suppose we get quotations on a moderate chemical and bacteriological outfit. An expenditure of less than \$500.00 will give us all we need, will equip us with first class analytic balances, microscopes, ovens, autoclaves, glassware and chemicals, will give us in fact a very good equipment for making most of the determinations we will be called upon to make. When this

amount is put along side of what a good many druggists pay for soda fountains, many of which do not much more than pay for themselves, but are only used to draw trade, I think you will see that a neat analytical laboratory will serve the latter purpose much better and, at the same time, fill a real need. The expense of operating such a laboratory need not be very large. Many druggists detail a man to look after soda-water and cigars and sundries, at a cost of \$50 or \$60 per month. The average young man that enters the analytical laboratories of our large corporations after leaving college begins at \$60 to \$75 per month. A bright graduate of the three or four years' course in pharmacy has all the basal education he needs to begin in such a laboratory and can help with the general drug business until there is enough work to occupy his entire time in the laboratory.

There is one matter, in this connection, that I wish particularly to call your attention to at this stage: The pharmacist has for years received in our schools of pharmacy a good chemical training but he has not made proper use of it. He has, it seems nearly always, taken a back seat, has not mixed in the fray, and consequently, in a short time after leaving college, he feels incompetent to anything more than fill prescriptions or sell cigars. Imagine a physician doing the same. He comes out of college as "green" as the pharmacist, but he has to "pitch in" and do things he has never done before. He does things every day which he never was taught how to do while in college. Naturally, most pharmacists have not been through the routine of most of the common bacteriological and chemical tests that would be required of them if they set out to become analysts, but they have the basal education necessary and it is only a matter of a little study, nerve and practice for them to become experts along this line. Moreover, the routine analysis of milk, water, foods, drugs, urine, blood sputum, serum, etc., have become so systematized that details and directions of procedure are easily available. It only takes a little time and practice for any one with a pharmacist's previous training to become expert in carrying them out.

If you have followed me in the rather scattered remarks I have made you will see that I have tried to establish the following points:

*First*—That pharmacy as it is today is a "mongrel creation" without standing in either the professional or business worlds.

*Second*—That the old ideal of pharmacy as a place where galenical preparations should be manufactured has to be in a large part abandoned because of the futility and undesirability of competing with the modern first-class pharmaceutical houses.

*Third*—That while the pharmacist should progressively abandon making most of his galenical preparations, he should increasingly strive to maintain his standard as a professional man by becoming a better "prescription compounder" and should bend his efforts towards the accurate checking of the drugs he buys and dispenses, rather than to their manufacture.

*Fourth*—That I have tried to show that the pharmacist has never lost the professional ideal of service and that modern life has a place for him in which to exert his very best efforts in a truly professional way.

*Fifth*—We have seen that there is a vast latent demand for analytical work of a chemical and bacteriological character from both the physician and the public in general. This work the pharmacist should do and can do by establishing an analytical department (even though it be very small) in connection with his store.

*Sixth*—That the analytical laboratory will become a source of profit to the druggist, it will serve a real need in the community, and last but not least, by doing this scientific work, the pharmacist will establish himself on a plane with the physician and lawyer and thus elevate his calling to that of a true profession.

### SOME THOUGHTS FOR TEACHERS.

---

ZADA M. COOPER.

---

Almost every magazine one picks up and even the newspapers are printing articles criticising the public school system. No part of it escapes; the kindergarten and the university alike get their share. "What is Wrong with the College," "Why I am Poorly Educated," or similar titles are a familiar sight. Apparently, these critics of our schools lose sight of the fact that all sorts of people go to school and *almost* all sorts go to college. They forget that in the manufacture of anything the raw material controls the nature of the finished product; as some one has aptly said, "Critics of colleges never consider the kind of grain that comes into our hoppers."

We, who are teaching in colleges of pharmacy, cannot help wondering if we are in any way concerned with the imperfections, if those faults are in any way reflected in our work. We should expect, perhaps to see the chief evidences in freshmen classes and are at once confronted with the idea that possibly a large proportion of students conditioned or failed during this year can trace their difficulty to the public schools.

In any consideration of the subject, the mentally unfit, those actually lacking in capacity, may be disregarded. There are such, but very few reach college. The individuals who are below the average of intelligence are not many because they are eliminated earlier in their school career. Speaking of average intelligence it can be said with little fear of contradiction that any one of average intelligence who works conscientiously will get through college creditably.

To go back to the original question, there is no doubt that many general reasons are involved. Conditions are similar to those existing in freshmen classes in any professional school or even in the colleges of liberal arts. Perhaps, the whole situation can be summed up under two heads, insufficient preparation and lack of thoroughness in that preparation. Some colleges of pharmacy are handicapped in having students who are not graduates of high

schools, though most teachers will concede that a high school education is little enough general education as a foundation for the study of pharmacy and the sooner all colleges adopt that as a minimum entrance requirement, the better it will be for them and for the profession as a whole.

However, insufficient preparation is a minor difficulty when compared with the lack of thoroughness; the one is within our control, the other entirely beyond it. We can say what the preparation shall be so far as quantity is concerned, but the quality of that work we may not specify. Even if we could, surface indications are of little value. Grades should mean something, they usually do mean something, and yet they may be absolutely worthless in foretelling what the individual may do in college. Doubtless every teacher in every college of pharmacy has had, not once, but again and again, in beginning classes some students who had so little knowledge of the most fundamental things as to arouse the wonder whether they knew the multiplication table or could read the English language intelligibly. Yet those very persons may have presented the best of credentials.

Even men who have done some years of work in a liberal arts college or who have a degree are among the failures in professional schools. The explanation of this is simple. The slipshod superficial work of the preparatory school has been continued, aggravated, perhaps, by the elective system which permits the choice of "snap courses," thereby fixing more permanently the bad habits of earlier years.

If it were possible to trace the real cause it would probably be found in the early years of a pupil's career, possibly at the very beginning. The child gets into bad habits of thought and bad habits of work and as the years go on the habits grow until it is almost impossible to accomplish anything in college. Probably, always in the beginning, these bad habits are acquired unconsciously but later they may be systematically practised. However acquired or however fostered, the result is much the same. It is impossible to rear a superstructure on such an inferior foundation. Sooner or later it is bound to topple.

There is one fault of the public school system that deserves more than passing attention because it is one which is carried right into college. In the words of a great educator: "This part and that part of the individual are developed most methodically with the result that the modern useful mind is full of water-tight or idea-tight compartments, snug places where assorted bits of information are safely tucked away but there is no communication between." Doubtless every teacher has observed this very fact when students fail to apply in one class room what they have learned in another. They appear not to dream that different class rooms are on the same planet. As this same author says further: "They are taught everything except how to pull themselves together, to think and act as entities, as personalities," and yet "Instant command of all the faculties at once is the one thing that life demands of us in its crises."

Educators are fully awake to the faults of the public school system and are, perhaps, doing all that they can to remedy them. At least, that is not our problem and discussion of these faults is unavailing except that thorough understand-

ing of any condition makes it easier to meet. Theorizing is useless, and there is little to suggest as to how we can overcome the conditions. The little that can be done must be largely personal assistance to each individual to help him to undo somewhat the faults, to replace his careless habits with careful ones, to teach him how to study.

Teaching students how to study can be to a considerable degree the outcome of an instructor's method of presentation. For example, the facts in any subject should not always be given directly to a class. If a textbook is used study is not limited to it but reference works are supposed to be consulted. In giving citations exact pages or paragraphs to be read is not as good as to ask that certain points of interest be looked up. Recitations should be conducted in such a way that a student must have read the references in order to recite. In assigning a lesson, attention should be directed to the points that must be investigated, the necessity for knowing the reasons involved in various processes, but students should be expected to dig out the facts themselves. Outside written work should not be resorted to for it puts a premium upon dishonesty. However great the effort on the part of an instructor, some students will not do the reading themselves but trust to providence or their neighbors. On the other hand, many can be induced to search out the subject and once they get the habit, they begin to acquire the spirit of learning which is the secret of success.

We must make our courses attractive and interesting, and attractive should not mean easy. Naturally an easy course may be attractive but the reverse is not necessarily true. In fact, the course ought to necessitate hard work but not disagreeable work. It is for us to make knowledge so vital that students cannot help being interested.

Whether dealing with poorly equipped students or the best, the function of every college is two-fold, one of which is sometimes minimized in practice or lost sight of entirely. The teaching of facts is not likely to be forgotten but it is not so easy to remember that the intelligence must be trained, that sound judgment and good common sense should be cultivated. It is general wisdom and ability to use his accumulation of facts, to correlate them when some specific situation arises, which makes the individual successful. No teacher can be present to direct the application (in real life) of information he may be trying to get into the minds of his class, no teacher can anticipate the emergencies that may arise. The teacher's duty is to try to awaken or to increase the enthusiasm for learning and to do this so thoroughly that students develop power to investigate for themselves and to apply for themselves their stores of information. Students, if they hope to succeed when they have left the college of pharmacy for the larger college of life, must acquire personal initiative, must be intellectually alert. Lyman Abbott summed up the situation in a few words when he said: "Education is not only the acquisition of information, it is even more the development of capacity to deal with the facts thus ascertained, it has come to be the acquisition of power even more than the acquisition of information."

Probably no definite system is available to teachers. There is no royal road to learning either for teacher or student. The ultimate end of independent thought and action on the part of students must never be lost sight of. Eternal vigilance

is the price. It is a landable ambition for teachers to want degrees and what they stand for, but there is no degree which guarantees ability to teach. Teachers should be men and women with good red blood in their veins, not just "semi-vitalized text-books."

---

## LIQUID PETROLATUM, RUSSIAN AND AMERICAN.

---

E. H. GANE, PH. C.

---

Liquid Petrolatum is destined to be, if it be not already, the most extensively used medicinal substance at our disposal.

In the crude form, petroleum has been more or less in use for many centuries, references to it being found as far back as 600 B. C. The use of the highly refined product known as Liquid Petrolatum is, however, of very recent origin, dating back only to the early eighties of the last century. Since that time in one form or another it has been recommended as a cure for almost every ill that flesh is heir to. In addition, it has also been used as a substitute for or as an adulterant of lard, butter and vegetable oils used for culinary purposes and it was investigations into its value as a food that led ultimately to its present enormous vogue in internal medicine.

It was early determined that Liquid Petrolatum had no food value, but passed unchanged through the intestinal tract. Nevertheless, petroleum emulsions, plain or combined with other medicaments, have been largely prescribed for some years and usually with very good results, despite the dogmatic assertions from test-tube investigators to the effect that these preparations were valueless or fraudulent. We know now that, while the claims made for these products were inaccurate, the preparations had real value due to the corrigent action of the petroleum on the intestinal tract.

Liquid Petrolatum as an internal remedy is distinctly an American idea. Little attention was paid to the work of earlier investigators by physicians until a series of papers presented to medical societies in Ohio and Indiana between the years 1900 and 1903 led to its continued use in that part of the country as a remedy for chronic constipation and intestinal obstructions. Since that time its use has been developed enormously, being especially aided by the strong recommendation of the great English surgeon, Sir William Arbuthnot Lane, given at the Congress of Surgeons held in New York in 1912. Much of the credit for its discovery as a therapeutic remedy has gone to Mr. Lane, though many American physicians antedated him in using it.

It is not necessary to do more than mention that the value of Liquid Petrolatum for medicinal purposes lies in the fact that it is inert. It is possibly the only medicine that has no medicinal action, but works purely mechanically. It is

simply a lubricant and its action is similar to that of oil on rusty machinery. It lubricates a defective drainage canal and its value appears unquestioned.

What we are particularly concerned with is the quality of the oil that should be used for medicinal purposes. This is especially important just now in view of commercial conditions in the petroleum industry. The U. S. P. requirements are exceedingly lax and admit of a wide range of products being used. Up to the outbreak of the war Russian petroleum was mainly used as a source of Liquid Petrolatum, and during the last two years enormous quantities of "Russian Oil" have been consumed. The quality was not always all that could be desired.

Russian and American petroleum are different in composition. American oil consists mainly of methane hydrocarbons with some olefines, while Russian oil is composed of naphthene hydrocarbons. The Russian oil can be refined more easily and more cheaply, so that it has held the market to the exclusion of American oil, the only medicinal oils on the market of American origin being oils that had been treated by filtration and decolorization with bone black. These oils did not hold their color and had also a strong fluorescence so that on esthetic grounds alone they were not popular.

The European war, however, cut off supplies of Russian oil completely so that we have been forced to look to American refineries for supplies of "White Oil." Owing to uncertainty as to how long the war would last refiners were not at first anxious to put up a plant that would have to be scrapped as soon as the war was over, but when it was evident that the war would last some time, several plants were started, and so rapid has been the progress made by our chemists in refining American oil that today one or two refineries are turning out preparations that compare favorably with the best Russian oils. This is no small achievement to have accomplished in so short a period of time.

The quality of the oil used as a basis for Liquid Petrolatum is of the highest importance and too little attention has been paid to this point. Oils of all grades have been sold for medicinal purposes and some of the largest houses have supplied and are supplying products that were far from being what we might expect from such sources. The only requirements insisted on in many cases were that the oil should be colorless, tasteless and odorless. But these requirements are by no means adequate. Many Russian oils that met these requirements were still not fit for the uses to which Liquid Petrolatum is put and the same is even more true of American oils.

Being used solely as a mechanical aid, Liquid Petrolatum must be taken for long periods and often in large doses, and, therefore, extra precautions must be used in obtaining an oil that is *inert*. Despite its chemical properties, petroleum is by no means inert physiologically. For a long time it has been known that workers in petroleum refineries were especially liable to skin affections of a serious and even malignant character. The recent researches in England of Ross and his co-workers have demonstrated that petroleum, among other products, contains a substance that possesses the property of causing increased cell growth. The importance of this discovery cannot be over emphasized for it is easy to see

how important a factor it may be in connection with the internal consumption of Liquid Petrolatum. Were the oil only taken for short periods the presence of this substance might not be very material, but it can readily be seen that the constant presence in the intestinal tract of a substance possessing the above mentioned property might result in most serious consequences especially in cases where there is a lesion of some sort. Every precaution should be taken to insure the elimination of this substance from petroleum for internal administration.

It is also important that Liquid Petrolatum be free from any other substances that might be active physiologically. This is especially necessary with American oil which contains varying proportions of olefines or unsaturated compounds. These hydrocarbons may enter into combination with bodies of an acid nature, with acetones, aldehydes and compounds having an hydroxyl group. They may enter into combination with substances in the alimentary tract, and while little is at present known of their behavior in this connection, care should be taken to exclude them from Liquid Petrolatum the use of which is based on the idea of its inert character.

In addition to these possible impurities, Liquid Petrolatum may contain sulphur compounds which are frequently present in oils of a certain character. Sulphur compounds are objectionable for many reasons, in particular because they tend to prevent absorption of iron which is so necessary to proper functioning of the system. They should be eliminated from Liquid Petrolatum. Lastly the oil should be absolutely neutral.

Fortunately there are a series of very simple tests by which Liquid Petrolatum can be controlled and no oil should be used for internal administration that does not pass, first of all, the following tests which are those laid down in the 1914 edition of the British Pharmacopoeia, and which will probably be followed in the ninth revision of the U. S. P.

(1) When 3 millilitres are heated with an equal volume of sulphuric acid in a test tube placed in boiling water for ten minutes and frequently shaken, the acid layer, after separation, is not darker than pale brown.

(2) A mixture of 4 millilitres of Liquid Petrolatum, 2 millilitres of absolute alcohol and 2 drops of a clear saturated solution of lead oxide in solution of sodium hydroxide (20 per cent.), remains colorless when kept at 70° C. for ten minutes.

(3) 10 millilitres of alcohol (90 per cent.) boiled with 5 millilitres of Liquid Petrolatum are not acid to litmus.

These tests insure absence of olefines and other organic impurities, sulphur compounds and acids used in purifying the oil but they do not insure absence of the substance which promotes cell growth. The researches of Ross have shown, however, that this substance, the exact nature of which is not at present known, is soluble in water and can be eliminated by washing the oil with hot water. This additional precaution should, therefore, be taken in refining petrolatum for medicinal use.

A word may be said in reference to the question of density. One of the objections to the continued administration of Liquid Petrolatum was that after a

time it had a tendency to exude involuntarily from the rectum. For this reason physicians have been demanding heavy oils, some even prescribing solid petrolatum with a view to avoiding this trouble. It has been found, however, that this involuntary evacuation was due wholly to too large dosage and occurs with heavy as well as light oils. It can readily be corrected by diminishing the dose and, therefore, as the lighter oils are more easy to take and require a smaller dose they are now used to as quite a large extent as the heavier oil. The question of dosage is one that each patient must determine for himself or herself. No hard and fast quantities can be set down. Some patients require large doses frequently, while others can obtain satisfactory results by as little as a teaspoonful two or three times a day. The usual starting dose is one to two tablespoonfuls at bedtime gradually reducing the dose as conditions improve.

Another debatable question is the time at which Liquid Petrolatum should be administered. Many physicians advise that it be given only on an empty stomach the claim being made that administering with food is liable to cause digestive disturbances as the "oil coats the particles of food and prevents action of the gastric juices."

Anyone with an elementary knowledge of physics will recognize the fallacy of this argument and the impossibility of coating moist food particles with oil. The statement that has also been made to the effect that prolonged use of the oil will coat the intestinal canal with oil and prevent absorption can be characterized as equally absurd being opposed to all known physical laws. Furthermore, the fact that the amount of oil ingested can be obtained in toto from the feces also disposes of this argument. It is axiomatic that oil and water will not mix.

Finally the question that naturally comes up just now is which oil is the best, American or Russian? The answer is that to all intents and purposes one is as good as the other for internal administration, provided it is properly refined and stands the tests before given. The American oil in general is of lighter gravity than the Russian, but is, however, of greater viscosity. American oil of a gravity of .845 can be prepared of as great a viscosity as the Russian oil of .885 gravity. This is due to the presence of higher paraffines in solution and is the reason why American oil, as at present manufactured, has no "cold tests." Russian oil remains clear at 0° C, while American oil, even the less viscous product, becomes turbid at that temperature. This does not, however, affect its medicinal properties.

In conclusion, attention is invited to the accompanying table giving the results of an examination of a series of samples obtained from manufacturing houses and from retail stores which shows that there is a great deal of oil being sold that does not come up to the requirements of a pure inert oil for medicinal purposes.

A word of advice to the retailer may not be out of place and that is to buy your oil from a drug house that has been identified with the preparation and sale of medicinal products rather than from those concerns that cater to lubricating and automobile supply houses.

## SAMPLES OF MINERAL OIL OFFERED FOR SALE BY VARIOUS CONCERNS.

No. of Sample	Source	S. G.	Lead Oxide Test	H <sub>2</sub> SO <sub>4</sub>	Color and Odor
1—Wholesale Drug House.		.840	No Color	Very Faint Color	Colorless Odorless
2—Oil Supply House.....		.851	No Color	Yellow	Fluorescent Petrol Taste
3—Mfg. Pharm. House....		.858	No Color	Dark Brown	Fluorescent Petrol Taste
4—Jobbing House.....		.847	No Color	Slight Yellow	Colorless Odorless
5—Oil House.....		.850	No Color	Reddish Brown	Strong Fluorescence
6—Retail Association.....		.857	Brown Color	Dark Brown	Yellow Fluorescent
7—Oil Refinery.....		.850	No Color	Brown, Nearly Black	Fluorescent
8—Mfg. Pharm. House....		.854	Brown Color	Dark Brown	Colorless Sl. Fluorescence
9—Wholesale Drug House.		.844	No Color	Slight Yellow	Colorless Odorless
10—Wholesale Drug House.		.848	No Color	Faint Color	Colorless Odorless
11—Oil Refinery.....		.841	Brown Color	Black	Fluorescent Petrol Taste
12—Oil Refinery.....		.847	No Color	Slight Yellow	Colorless Odorless Petrol Taste

All these samples were American oil. Sample No. 10 was an "extra heavy" oil and was almost solid at a temperature of  $-5^{\circ}$  C. At  $+5^{\circ}$  C. it was quite cloudy, and while the oil was very viscous, the gravity was little above that of the ordinary light oil. The viscosity was due to dissolved paraffine. Of the above 12 samples only numbers 1, 4, 9 and 10 can be considered really fit for medicinal use. Sample No. 5 is a filtered oil that has been freely sold to the retail trade.

EMETINE HYDROCHLORIDE AS AN AMEBICIDE AND  
HEMOSTATIC.

FRANCIS E. STEWART, PH. G., M. D., PHAR. D.

## I. EMETINE HYDROCHLORIDE.

Emetine Hydrochloride, or Emetinæ Hydrochloridum, is the hydrochloride,  $C_{36}H_{44}N_2O_4, 2HCl, 2H_2O$ , of an alkaloid found in *Cephalis ipecacuanha*. According to "New and Non-official Remedies," published by the Council on Pharmacy and Chemistry of the American Medical Association (see Journ. A. M. A., July 5, 1913), it occurs as a white crystalline powder, soluble in water and alcohol. The aqueous solution of emetine hydrochloride is practically neutral toward litmus. The general alkaloidal reagents precipitate emetine, even from dilute solutions. Alkalies precipitate emetine from aqueous solutions of its salts. A freshly prepared concentrated solution of ammonium molybdate in concentrated sulphuric acid (Froehde's reagent) is colored green by emetine hydrochloride.

"If about 0.10 gm. of emetine hydrochloride be dissolved in water, the solution made alkaline with potassium hydroxide, shaken with ether till nothing more is extracted, then acidified and made alkaline with ammonia water and again extracted with ether, the second ether extraction on evaporation should yield a residue which, when treated with Froehde's reagent, should not become purple.

"If emetine hydrochloride be dried to constant weight at  $100^{\circ}$  C. the loss in weight should not exceed 8 percent of the original substance.

"*Actions and Uses.*—Emetine acts similar to ipecac but is relatively more nauseating and less emetic, and causes relatively less renal irritation, but more cardiac depression. Emetine hydrochloride in the form of injections has been reported to be of especial value in amebic dysentery.

"*Dosage.*—Expectorant, from 0.005 to 0.01 gm. ( $1/12$  to  $1/6$  gr.). From 0.01 to 0.02 ( $1/6$  to  $1/3$  gr.) causes emesis, but cephaeline is preferred as an emetic. By hypodermic injection, 0.03 gm. ( $1/2$  grain)."

Amebicidal dose, in amebic dysentery, for hypodermic medication:  $1/2$  to  $3/4$  grain, for adults;  $1/3$  grain for children of about eight years of age (Rogers). Amebicidal dose, in pyorrhea alveolaris,  $1/2$  of 1 percent solution to be injected into the pockets of infection daily for at least five days, then every other day until a total of about ten treatments have been made (Barrett);  $1/2$  grain daily for three to six days hypodermically (Bass).

## II. EMETINE HYDROCHLORIDE AS AN AMEBICIDE IN AMEBIC DYSENTERY.

In 1902 and 1903 Rogers\* reported in the British Medical Journal the common occurrence of amebic dysentery in India, where it had not previously been recognized, and established its role as the cause of tropical or amebic abscess of

\* Leonard Rogers, M.D., F.R.C.P., I.M.S., Professor of Pathology, Calcutta.

the liver, the relationship of which to antecedent bowel disease was up to then much disputed in the East.

In the course of his investigation he ascertained that ipecac has a definite specific action in the treatment of amebic disease, but is of little or no value in the bacillary type. In 1907, he demonstrated that the same drug will rapidly cure amebic hepatitis (amebic inflammation of the liver) in the pre-suppurative stage, and thus prevent the formation of amebic liver abscess if given in good time.

When analyzing a series of cases of amebic dysentery, treated with full doses of ipecac, from 30 to 60 grains a day, Rogers was struck by the fact that he had lost one-third of his cases, while another one-fourth had left the hospital uncured, declining to go on with the treatment. The great majority of his patients were either very acute or advanced chronic cases, while several died within two days of admission, being hopeless on their first arrival at the hospital. In some serious cases the good effect of the drug was very evident, but nevertheless in many it was clear that sufficiently large doses could not be administered by the mouth in time to save the graver cases. Recalling to mind Vedder's experiments in Manila with fluidextract of ipecac as an amebicide, Rogers tested the effects of the alkaloid, emetine, derived from ipecac, in the form of hydrochloride, on undoubted ameba dysenterica in the mucous stools of amebic dysentery patients, and found in a dilution of 1:100,000, that the emetine hydrochloride kills them. He therefore determined to try emetine hydrochloride hypodermically in severe amebic inflammation of the colon. The results were most remarkable and thoroughly demonstrated its superiority over ipecac as a remedy for amebic dysentery.

Rogers' brilliant discoveries were the cause of a decrease in the annual death rate from abscess of the liver in the British Army in India, to only 30 percent of its former steady number within three years, and a similar decrease in the death rate from abscess of the liver in the Calcutta General Hospital.

Until more recently ipecac did not find favor among American physicians. However, in 1909, Simon, of New Orleans, advocated its use in large doses in amebic bowel disease, and further verification of its value was furnished by the experience of Dock, Roberts, Brown, Zeiler, Allan, Lyons and other competent observers. From this time onward, ipecac and its alkaloid, emetine in the form of hydrochloride, grew in favor and became popular throughout the world. At a meeting of the Academie de Medicine of Paris on February 25, 1913, Chauffard reported a case of dysenteric abscess opening into the bronchi, in which rapid recovery took place. At a meeting of the Societe Medicale des Hopitaux of Paris on April 11, M. S. Costa reported a case of amebic abscess of the liver cured by the same treatment, but aspiration was also performed. In the China Medical Journal for March, Dr. J. Preston Maxwell reported ten cases of amebic dysentery treated with great success by injection of emetine. Later Chauffard reported to the Societe Medicale des Hopitaux de Paris another case of dysenteric abscess successfully treated with emetine. Dr. Rouget reported that he had suppressed an amebic abscess of the liver by a subcutaneous injection of emetine. Dr. Flandin reported the case of a woman who had contracted amebic dysentery

in Madagascar, and presented sometime later an abscess of the liver which opened into the bronchi and necessitated an operation. The patient was cured by subcutaneous injections of emetine hydrochloride in 0.08 gm. (13/16 gr.) doses per day.

Dr. Dopfer gave an interesting account of a case of amebic dysentery which had resisted the usual methods of treatment and was completely cured by three injections of emetine hydrochloride, the first dose 0.02 gm. (5/16 gr.) and the other two in doses of 0.04 gm. (5/8 gr.) each.

*Dosage in Amebic Dysentery.*—Rogers, in commenting upon the administration and dosage of emetine hydrochloride in amebic dysentery, advises that solutions should be made by adding the emetine hydrochloride to previously boiled water or normal salt solution, but prefers doses put up in sterile glass ampoules ready for use. The solution should be isotonic with the blood. In the treatment of amebic dysentery, he began with one-third grain doses, equal to 30 grains of ipecac, but now uses one-half or two-third grain doses in adults, while one-third of a grain may be given with perfect safety in children of about eight years of age. He says that he has several times given as much as a grain at once, two or even three times a day in adults, and has never seen any depression or other alarming symptoms follow its use. Very occasionally, severe pain may result at the seat of injection, but this is quite exceptional, and there is usually no sign of any local reaction. Half a grain twice a day give uniformly good results, or a larger dose once a day may be used if this is more convenient.

Quite as striking is the rapidity of the cure by emetine. Thus in a series of cases, the average stay in hospital of the recovering ipecac cases was 16.4 days, and of the emetine ones 7.2 days, including one day they were kept under observation, if not urgent cases, before the treatment was begun. Further, the average number of days under ipecac before the stools became finally normal was 11.4, and the average amount of the drug given amounted to 406 grains; while the corresponding figures for the emetine treatment were respectively 2.35 days and 2 grains of the drug, equal to 180 grains of the powdered ipecac.

*Diagnostic Value of Emetine Injections.*—Another interesting and valuable fact in connection with the use of emetine hydrochloride in curing dysentery and amebic abscess is that the action is specific. So thoroughly specific is this action that Rogers believes that where clinical microscopic facilities are not available the response to the use of emetine is diagnostic. Where the dysenteric symptoms are not affected by a few injections of the drug, the conditions have always been found to have been due to some other cause than the ameba. The blood and mucus nearly always finally disappear from the stools of an amebic dysentery patient within two or three days, four days being the longest period he has observed. In bacillary dysentery, on the contrary, the drug exerts little or no effect, so that the failure of the emetine injections to produce a very material improvement in the stools within two or three days affords very strong evidence that the disease is not amebic in origin.

## III. EMETINE HYDROCHLORIDE AS AN AMEBICIDE IN PYORRHEA ALVEOLARIS.\*

Barrett, in 1914, working in collaboration with Allen J. Smith, Professor of Pathology in the School of Medicine, University of Pennsylvania, announced the discovery of the *Endameba buccalis* as the primary etiological factor of pyorrhea alveolaris. The report was founded upon 45 cases of suppurative affections of the gums and pericemental tissues, in all of which without a single exception, parasitic amebas were discovered in active motility.

While confident of the actual pathogenic importance of these parasites from their uniformity of occurrence and distribution and from the evidence of their ingestion of leucocytes and erythrocytes, the authors did not feel justified in attempting inoculating experiments. They applied another test for pathogenicity which seemed conclusive. Resource was had to the use of emetine, a specific against the endamebas of dysentery. Accordingly, 13 cases of pyorrhea alveolaris, or Riggs' disease, were treated locally by injecting into the pockets of infection (which in that disease occur at the margin of the gums) one-half of one percent of emetine hydrochloride. In several of these 13 cases, the pus disappeared from the pockets completely to gross inspection in twenty-four hours after application. This result was attained in all the cases after three daily local treatments.

Dr. C. C. Bass and F. M. Johns, Tulane University, College of Medicine, New Orleans, La., working independently of Barrett and Smith and without knowledge of their investigations, arrived at the same conclusions. Their first paper on the subject, "The Specific Cause and the Prompt Specific Cure of Pyorrhea Alveolaris or Riggs' Disease," appeared in the New Orleans Medical and Surgical Journal, November, 1914. Another contribution by the same authors appeared in the Journal of the American Medical Association, February 13, 1915, entitled "Pyorrhea Dentalis and Alveolaris—Specific Cause and Treatment."

*Dosage in Pyorrhea Alveolaris.*—Microbic invasion of the tissues of the mouth is now considered the determining etiological factor. The microbes associated with pyorrhea alveolaris are of two kinds, namely, protozoa and bacteria. Bacterial infection as an etiological factor has been recognized for a number of years. It is only within the last year that the part played by the protozoa has attained importance in the etiology of the disease. To Barrett, Smith, Bass, Johns and their co-workers, we are indebted for our present knowledge concerning *endameba buccalis* as a causative factor in producing Riggs' disease.

In the treatment of pyorrhea alveolaris the objects are, first, to destroy the infecting micro-organisms; second, to get rid of the pockets of infection existing between the gums and the teeth; third, to prevent re-infection; fourth, to restore the tissues to a normal condition as far as possible; fifth, to meet the indications arising from systemic infection, for it is now known that an infected mouth may infect the system, and systemic infection predisposes to lowered tissue resistance and a continuance of the local condition.

This paper only deals with the use of ipecac (and its alkaloid, emetine) which, properly employed as an amebicide, is capable of killing out the ameba *buccalis*.

\* Paper entitled "The Protozoa of the Mouth in Relation to Pyorrhea Alveolaris," read before the Pennsylvania State Dental Society, Philadelphia, July 1, 1914, and afterward published in the Dental Cosmos for August, same year.

The employment of operative procedures is also essential to the cure of Riggs' disease, and the use of bacterin treatment may also be necessary.

Emetine hydrochloride may be used locally or systemically in the treatment of pyorrhea alveolaris. Barrett recommends its employment locally in one-half of one percent solution. Stronger solutions are apt to provoke inflammatory reactions in the gums. Care should also be taken to use a neutral salt, as free hydrochloric acid is liable to irritate the gums and adjacent surfaces. The solution should also be isotonic with the blood for it may prove irritating if used in stronger or weaker solutions.

The solution is introduced into the pyorrhea pockets by means of a hypodermic syringe, preferably with a curved, blunt-pointed, needle. Treatments which include all recognizable pus pockets, and especially parts under suspicion, should be repeated daily for at least five days, and thereafter every other day, until about ten treatments as a total have been made. Microscopic examination of scrapings from the pockets should be made from time to time for persisting endamebæ as the treatment progresses, and this, together with the general appearance of the lesions, will determine the appropriate duration of treatment. In some of the less marked and less chronic cases, a total of five or six applications or even less may be sufficient, while in the more stubborn instances, treatment may be continued even longer.

Barrett further states that coincident with the disappearance of the endamebæ, the soreness, pain or discomfort, and the amount of pus formed, rapidly decreases. The tendency to bleed from slight trauma usually ceases within forty-eight hours, and in almost all cases the patient recognizes and feels confident of the beneficial effects within a few days.

Bass and Johns find that the endamebæ may be destroyed in cases of pyorrhea alveolaris by the subcutaneous injection of emetine hydrochloride. According to these investigators the endamebæ disappeared from the lesions following from one to three days of hypodermic treatment in more than 90 percent of all cases. Injections of one-half grain up to three grains were sufficient. All cases should be treated at least three days and none need more than six. Usually one-half a grain daily for three to six days, depending upon the case and the stage of the disease, is all that is required to accomplish the purpose.

*To Prevent Re-Infection.*—Barrett says with truth that every unhealed lesion must be regarded as a source of re-infection which will certainly promptly occur just as long as endamebæ are being constantly thrown off from the pockets of infection. Therefore these pockets of infection should be healed and permanently abolished, first by proper operative procedures, including scaling off the tartar from the teeth (which can be greatly facilitated by the use of bifluoride of ammonium solution as recommended by Dr. Joseph Head, of Philadelphia); and, second, by the employment of emetine hydrochloride and ipecac. Bass first recommended rinsing the mouth thoroughly with a solution of fluidextract of ipecac—two or three drops to a half tumbler of water—which he believes protects against reinfection. Later he recommended the use of emetine hydrochlor-

ide dissolve in alcohol,—strength 1 to 10—one drop of which should be applied to a wet tooth brush, and used for brushing the teeth every night before retiring.

A valuable mouth wash containing ipecac to be used as a preventive of re-infection and as a cure for pyorrhea alveolaris in mild cases, to meet the suggestion of Bass may be prepared by combining the following:

Fluidextract Ipecac .....	8 min.
Zinc Chloride .....	2 gr.
Beta-naphthol .....	$\frac{1}{2}$ gr.
Solution Formaldehyde (40%).....	$\frac{1}{3}$ min.
Menthol .....	$\frac{1}{8}$ gr.
Oil Gaultheria, q. s.	
Alcohol, 55 percent, q. s. to make one fluid ounce.	

Directions: Cleanse the teeth and gums with the solution undiluted, using a soft tooth brush. As a mouth wash, add 20 drops to about two tablespoonfuls of water.

#### IV. EMETINE HYDROCHLORIDE AS AN HEMOSTATIC.

C. Flandin,<sup>1</sup> impressed by the prompt disappearance of blood from the stools in cases of amebic dysentery treated by hypodermic injection of emetine hydrochloride investigated its action as an hemostatic in hemorrhage from the lungs. He applied the remedy by the same technic as for dysentery, injecting into the thigh 1 cc. of distilled water containing 0.04 mg. (about  $\frac{5}{8}$  gr.) of the salt. The result of the injection was surprising, the hemorrhage stopping immediately.

In about twenty cases in which this treatment was used, the hemotysis was regularly arrested, even where copious hemorrhage had been taking place but a short time before. With the exception of one case of galloping tuberculosis, the tendency to pulmonary hemorrhage seemed definitely arrested. However, in the more threatening cases he repeated the injection twelve hours later and once on the following day, and if necessary on the fourth and fifth days.

The injection causes temporary pain only in the most sensitive individuals. No disagreeable sensation was experienced, no palpitation, dizziness or nausea. In some cases there was no longer a trace of blood in the sputum, but occasionally blackish stools were present and persisted for a time.

Why does emetine arrest pulmonary hemorrhage? The reason is obscure. H. C. Wood, Jr.,<sup>2</sup> says: "The alkaloids of ipecac seem to have some peculiar predilection for the lungs. A number of investigators have observed areas of pallor and of intense hyperemia in the pulmonary tissue."

The effect was not due to a lowering of blood pressure, for the author's sphygmomanometric measurements showed the pressure to remain the same; nor could he detect any effect on the coagulability of the blood or the number of red cells, leucocytes, and platelets. The measure seems to be entirely harmless and has succeeded when all others have failed. In but a single case was permanent arrest of hemoptysis not obtained with emetine.

*Can Emetine Hydrochloride Be Used by Mouth?* As the hypodermic method is not always convenient in practice, Rogers has tried giving one-third of a grain of emetine hydrochloride in tablets by mouth on an empty stomach, and finds that two-thirds of a grain can generally be taken without producing any material

<sup>1</sup> Presse Medicale, September 14, p. 777; Jour. A. M. A., November 4, 1913.

<sup>2</sup> Pharmacology and Therapeutics. By H. C. Wood, Jr., M. D., J. B. Lippincott Company, London and Philadelphia, 1912.

sickness and with much more favorable results than with ipecac by the mouth. However, the action is slower and less effective than by the hypodermic method, and in one patient blood and mucus reappeared in the stools after three days absence, although he had taken a total of two grains by the mouth; but all symptoms finally vanished after two more days of hypodermic medication.

Tablets of ipecac and of emetine are now used by mouth in the treatment of pyorrhea alveolaris. Bass and Johns recommend a tablet of ipecac, each representing 10 grains of the powdered drug. "One tablet three times a day does not destroy the endamebas in the mouth in many cases in a week or ten days. Two tablets three times a day destroys all demonstrable endamebas in six days or less in practically all cases. Three tablets three times a day destroy all demonstrable endamebas in from four to six days." The authors say that this tablet does not cause nausea, but there is frequently more or less abdominal discomfort and also some looseness of the bowels. However, members of the West Virginia Dental Society reported to me their experience and stated that nausea is sometimes produced by the tablets and their use must under such circumstances be dropped until the symptom disappears. Bass says that he would expect to find an individual occasionally who could not take the tablet satisfactorily and also those who would not absorb enough of the drug to destroy the endamebas on account of the diarrhea produced carrying it through the intestinal canal too rapidly.

#### CAN EMETINE HYDROCHLORIDE BE SAFELY INJECTED INTRAVENOUSLY?

Rogers has found that emetine hydrochloride can be safely injected intravenously in considerable doses. In one severe case of amebic dysentery he gave first, half a grain of the drug dissolved in 5 cc. of normal saline, injected very slowly into the median basilic vein, without the slightest depressing effect on the pulse, while the same evening he gave two-thirds of a grain and a day later, a one-grain dose in the same way, in addition to several subcutaneous ones. The favorable results in this case,—an extremely severe one—justifies him in advising the intravenous method in such acute attacks of amebic disease.

#### DO EMETINE INJECTIONS KILL ALL THE AMEBÆ AND PREVENT RELAPSES?

This question is discussed quite at length in Rogers' papers, and while, in his opinion, it is still too early to give a final answer, yet some important evidence regarding it has been accumulated, sufficient in amount to justify him in believing that this method of treatment can completely sterilize the whole of the tissues of the body as far as pathogenic amebæ are concerned, and afford good ground for hoping that at last a simple drug has been found which will absolutely rid the human system of a deadly protozoal parasite.

## PROFIT AND PROFESSIONAL ADVANTAGES OF PHARMACEUTICAL MANUFACTURING BY THE RETAIL PHARMACIST.\*

---

F. W. NITARDY.

---

While most of us have a natural leaning toward one or the other side of pharmacy, professional or commercial, and may find it pleasant to contemplate the practice of pharmacy in accordance with our own pet notions or ideas, there are few of us who can afford to indulge in a one-sided business just for the pleasure we may derive therefrom. We owe a duty to ourselves and our families which requires us to practice pharmacy in a manner so its pursuit will yield the profits necessary to maintain our standing in the community equal to at least that of the moderately prosperous merchant or professional man.

Pharmacy, by its development, environment and demand of the public has become a vocation that intimately combines profession and business, and it is only by the harmonious and simultaneous practice of both that we may hope to obtain the full measure of success fortune has in store for those who serve well in their chosen capacity. So closely associated are business and profession in pharmacy that it is hard to draw a line between them or neglect one without injury to the other.

Many influences have been at work in later years which have had a tendency to reduce our professional scope or activity. Our investments have been increased and our returns decreased. Expense and cost of living have been on the advance. It behooves us therefore to take good care lest we allow foreign interests to make further inroads on our calling. Not only that, but it is pertinent for us to put forth every effort and use all legitimate means to increase our field of usefulness and service as pharmacists. For, by such means only, can we successfully hold our own under the ever-growing difficulties confronting us.

Pharmaceutical manufacturing by the retailer is a field of his rightful activity embodying commercial and professional pharmacy in a manner which makes it of peculiar value to the present day druggist. It offers great opportunities and advantages: commercially, in the profit to be derived therefrom; professionally, in its elevating influence in causing the pharmacist to practice real pharmacy and exercise his skill. It is a most healthful stimulant to our business. It opens the door to greater prosperity and higher professional standing and respect. Its possibilities are far greater than any one, who has not investigated them, can realize. To some it may seem a matter of little moment.

That manufacturing, an important side of our business, should have been neglected to the extent it has, seems astonishing but if we just remember how

---

\* From an address before Nebraska Pharmaceutical Association.

easy it is for humans to be enticed into habits that relieve us of work, even though we suffer a loss of profit and prestige by yielding to this instinct, we can readily understand how we unsuspectingly, along with the doctor, fell victims to the manufacturers' exploits and arguments professing to save us money, trouble, labor and what not. Even now, we hardly realize what has been one of the fundamental causes of some of the distressing conditions that confront pharmacy. But the object of this paper is not to discuss the causes or events that brought about present conditions, but to offer some tangible proofs that we can help ourselves to greater prosperity by doing such pharmaceutical manufacturing as can conveniently be done by the retail pharmacist. I shall endeavor to show just what manufacturing means to the pharmacist by touching briefly on the various steps, considerations and equipment involved in the successful pursuit of this work, and showing the profit as well as professional advantages to be derived therefrom.

If I succeed in interesting you to the extent of investigating the possibilities of this field of pharmaceutical industry, or cause you to leave this convention determined to increase your activity along this line and put behind it the energy and enthusiasm it deserves, I shall feel that I have been more than repaid for my effort to serve you.

#### THE MANUFACTURE OF OFFICIAL PREPARATIONS.

That we possess a copy of the latest edition of the United States Pharmacopœia and National Formulary is of course essential in this work. Let us consider the formulas of these works for a moment. They have been subject to much criticism, but let me tell you the greater part of it is unjustified; while there are some formulas that are not entirely satisfactory, their number is small and the trouble they offer is easily overcome. Most of the criticism has been caused by the use of improper material. All our skill is useless when we try to make fine products from poor goods; not only will the final preparation be lacking in quality but frequently we encounter all manner of unlooked-for trouble. Here are two samples of simple syrup, one made from granulated sugar and the other from Confectioners A. The latter, clean and clear, free from ultramarine blue or other coloring matter, the former is dirty, turbid and looks yellowish as soon as the blue coloring has settled out. Granulated sugar is a commercial grade—good enough for household purposes but hardly fit for pharmaceutical use. The other, because it is a highly refined article, is free from coloring or impurities. A syrup made with a cheap granulated sugar is not only difficult to clarify by filtration or otherwise (pharmaceutical syrups should be clear and brilliant whenever possible), but the ultramarine blue so frequently present in the cheaper sugars will give rise to  $H_2S$  on decomposition. This is especially apt to happen in syrups containing free acids.

Similar illustrations of differences in quality could be made by producing preparations with commercial and official alcohol, commercial and pure chemicals, oils, etc., respectively.

We must buy good, yes, the best of materials for our manufacturing department. We must buy from reliable sources, more than that, we must be able to detect bad material and watch incoming goods closely enough to see that we get what we order. At present, we can feel fairly certain that goods are true to

label but it is a good practice to occasionally apply the official tests. Especially if we have reasons to doubt the quality of a given article. We should have the equipment and ability to satisfy ourselves as to their actual worth. The apparatus required for the simple pharmaceutical testing means but a very small investment, a few dollars will cover it and the value of the practice you or your employes get in applying these tests cannot be under-estimated. It gives you a feeling of security and when jobbers and manufacturers know that you can and will occasionally check the quality of goods received, they will exercise much greater care in seeing that you are supplied with goods meeting requirements. It is rather unpleasant for them to be caught in supplying goods that are not up to standard or in conformity with the label. Furthermore, this sort of work in your store will create respect for you, both with the laity and medical profession, for they will see that you have ability beyond that of a merchant.

Let me mention a few incidents illustrating the value of such work. I had been buying oil of turpentine from the same source for a long time. It came labeled as U. S. P. Oil of Turpentine and I had verified its quality by the usual tests. One day I received a notice from the Health Department to discontinue the sale of this commodity as they had found it adulterated. I immediately tested my stock and found that it was all right, so I wrote a courteous letter to the Health Department, stating that I had received their notice but that they were evidently in error as the turpentine I was selling was strictly U. S. P. A day later I met the State Chemist, who told me that he had examined many samples of Oil of Turpentine lately, and found none that were pure. He mentioned that he had relied entirely on the Sulphuric Acid Test of the U. S. P. I could see wherein he made his error as this test is faulty or may at least be misinterpreted by not being given in sufficient detail. I did not say much, but collected data from reliable authorities, principally from pamphlets published by the Department of Agriculture, showing wherein the test was deficient and then called his attention to this information. Shortly after an apology was offered, for the officials realized that they were mistaken.

Another incident was in regard to hydrogen peroxide. I had been buying from one firm but occasionally found their product below strength, and after several complaints discontinued my purchases. They then investigated the matter more thoroughly and were very much surprised to find that the fault lay with their chemist who was very careless in testing the product. The firm in question were manufacturers.

The necessity of watching the labels was brought to my attention when on ordering a pound of U. S. P. hypophosphorous acid I received the product of a very well known, and generally considered reliable manufacturing house, labeled "Hypophosphorous Acid," and in small type in one corner of the label appeared the note: "If this acid is neutralized with ammonia water, a turbid mixture will result which on filtration will yield a precipitate with Barium Chloride Test Solution." The U. S. P. requires that hypophosphorous acid shall do neither, but unless one is familiar with the tests for purity of this article, such statement on the label might easily be overlooked and hence also the fact that the product was not suitable for pharmaceutical use.

To get back to where I left off. Next in importance to buying good goods

and seeing that they comply with official requirements, is the process of production. Herein we should adhere strictly to the official formula unless the latter will under no circumstance produce a satisfactory product. This is necessary for several reasons. In our own opinion we may be able to improve on the official process, but others who are just as capable and qualified to pass judgment on these matters as we, may not agree with us. Uniformity is one of the most important points and uniformity in official preparations is out of the question unless everybody prepares them in accordance with official standards. As an illustration let me mention tincture of nux vomica. The official process calls for making this preparation by dissolving 20 grams extract of nux vomica in sufficient alcohol and water to make 1000 cc. of tincture. This makes a rich brown colored liquid. I know that some pharmacists make this preparation by diluting a fluidextract with sufficient menstruum. By this method a straw-colored liquid is obtained which further differs from the official tincture in containing a small amount of acetic acid introduced by the fluidextract.

A point frequently overlooked is the attention that should be given to the storage of our preparations, for it is quite important to protect sensitive products from the detrimental influences of light, air and temperature. Many excellent preparations have been spoiled or damaged by improper care in storage. When the Pharmacopœia states that a preparation, as for instance, spirit of nitrous ether, should be kept in *small, well-corked amber bottles in a cool place*, there is a good reason for keeping it this way. It deteriorates rapidly unless so kept. There is little difference between the pharmacist who prepares a substandard product and the one who permits a good product to become substandard through carelessness. In either case when such a product is dispensed, an injury is done to the patient, physician and pharmacy at large.

To be equipped to make the various preparations does not require a large outlay for apparatus. You need a number of percolators; some graduated receiving jars, these may be home-made, from candy jars or wide-mouth bottles; some porcelain evaporating dishes; flasks and funnels. Your prescription graduates and mortars will also serve in your manufacturing department. You should have a set of metric weights so as to save converting your formula into the apothecaries system and when once used you will find it the most convenient by far. Retort stands and steel rods fastened to shelves in your back room are very convenient to hang funnels and percolators. A filtering rack with adjustable shelves is desirable if space is available. Further necessities are thermometers; oven, water bath; tin, glass or rubber covers for funnels; scales beakers, spatulas, glass rods, etc. Earthenware crocks are quite handy as mixing vessels. Old glass stoppers will serve for percolator weights. In fact many little ideas will suggest themselves to you in carrying on the work that will save time, material and apparatus.

In making your preparations it is very desirable to have printed blanks, to be used for writing out your formula. Such a system prevents errors, saves your books and gives you a permanent record. All notes and other information, such as the amount of menstruum used in a percolation operation, notes on how troublesome points may be overcome, etc., should be made on the back of these blanks for future reference. These blanks should be numbered and filed like

COST CHART.

<sup>1</sup> Three quantities are given to show difference in cost in varying quantities.

<sup>2</sup> Manufacturers' charges: A represents one class of manufacturers, B another class, and C a manufacturing jobber. Wherever possible price for bulk quantities corresponding to manufactured amount are mentioned. In a few instances the preparations were not listed by some class of manufacturers.

<sup>3</sup> Price of B and C are for preparations of similar nature, but not in compliance with official formula.

<sup>4</sup> In arriving at the totals, quantities equivalent to the manufactured amount were figured and in case the preparation was not listed, the lowest competitive figure was used as a basis.

you do prescriptions. Such records will prove of much value. They should show, aside from the formula and directions, the cost of material, the time required to make the preparation, date and by whom made. If a card index is kept with a card for each preparation made, showing date, serial number of formula record, quantity made, cost of material, time, overhead and total cost, you will have all the information you may want in regard to any of your preparations. On a moment's notice, you will know just how much of each product you are using and what it costs you. Such a record system may seem complicated on first thought, but it takes very little time to keep it up.

I have prepared a chart showing what it costs to manufacture a few of the commonly used official preparations, using several classes and basing this cost on the cost of material, fifty cents an hour for the time required to produce the product and a further charge for overhead expense at 10 percent of the total. This chart also shows the prices charged by manufacturers for these same products, when bought in similar quantities. In all instances you will note there is a saving. Similar showing can be made on almost any preparation that can conveniently be produced in a drug store. The saving of money, however, is not the whole story. By making these preparations yourself, you can gain advantages worth more than the money you make. You gain arguments and talking points, with which to back up your prescription service and propaganda work, that would not exist for you otherwise. You will have a broader knowledge of and greater confidence in these preparations, factors that will prove a valuable asset. Your preparations will be better than those you can buy and the fact that you produce them, instills respect and gives you professional standing with the public and the medical men.

There are still other advantages worth considering, such as your increased buying power of crude materials used in manufacturing, which you would carry in more limited quantities in case you did not engage in this work.

For many pharmacists the cost of time and overhead expense included in the costs on the chart we shall now consider, is profit, for their pay roll and general expenses would not be decreased by refraining from making their own preparations, for the time devoted to this work would frequently be wasted, and rent, light, taxes, etc., would remain the same.

#### COST CHART.

You will note that on the preparations mentioned on the chart your investment in making them yourself would be \$23.60, as compared with an average of \$56.35 in case you buy them ready made. By paying yourself \$5.45 for time and \$2.89 for general overhead expense, you have a total of \$31.94, representing but 57 percent of the cost of the same materials bought from the manufacturers, while your cash investment is but 42 percent of the same. In other words, not considering the above mentioned advantages of manufacturing, and figuring your time and overhead expense into the cost of your preparations, you still make a profit of \$24.41 on a total cost of \$31.94. What other department in your store can make such a showing?

#### SPECIAL WORK FOR THE PHYSICIAN.

Hand in hand with the production of official preparations goes the special work you can do, such as the making of culture tubes, microscopic stains, test and

volumetric solutions for the modern physician who takes advantage of bacteriology and physiological chemistry as an aid to diagnosis, yes, practically relies on them. He needs various reagents for testing stomach contents, body secretions, etc., the preparation of which can be made a source of profit for the pharmacist. Physicians appreciate such service greatly. The opportunity along this line depends, of course, entirely on the kind of physicians in your vicinity. Practically all of the younger men value such service and many of them who are not using this class of preparations now, would avail themselves of this service if they knew it was obtainable.

The Pharmacopœia and reference works on pharmacy, chemistry and bacteriology give you formulas and information on this work. With the application of a little thought and energy, a profitable business along these lines can be created in many communities.

Another line of very profitable work for the pharmacist is the preparation of sterile solutions, intended for hypodermic and intravenous use. Direct medication is daily growing in favor with the medical profession and to make the introduction of medicinal substances into the blood or tissues of the body safe and free from unpleasant after affects, it is very necessary to have these products sterile. Sterile solutions in individual doses, dispensed in ampoules, have a decided advantage over the old hypodermic tablet and the modern physicians are rapidly becoming familiar with this fact. Empty ampoules may be bought quite cheaply and are easily filled, if you will equip yourself for this class of work.

Vacuum Apparatus for Filling Ampoules.

I have made a drawing, showing an inexpensive and very efficient vacuum apparatus, which I will explain herewith. Ampoules usually come with long sealed necks, clean on the inside. They are first washed outside, then the necks are cut to a uniform length and the so prepared ampoules are then placed right

side up in a flat bottom glass dish. A slightly smaller dish is inverted over them and then by inverting the whole, the ampoules will stand, necks down in the second dish. The amount of solution required to fill the number of ampoules contained in the dish is then placed in same and the whole placed in a vacuum desiccator. The air is exhausted, and then slowly allowed to enter the apparatus again. In this way the ampoules will draw up the entire amount of liquid. The dish is taken out of the desiccator inverted and the ampoules are now ready for sealing and sterilizing. In most cases it is desirable to place the unsealed ampoules in a sterilizer for a few minutes previous to sealing. The condensation of a small amount of steam in the necks of the ampoules will wash them and consequently prevent the charring of the substance, which would otherwise adhere to the necks. If they are sealed warm, there is also less danger of breakage in sterilization by heat, especially if they are sterilized by boiling in water.

Sterilization may be accomplished either by placing the filled and sealed ampoules in a dish of preferably colored water and boiling them for twenty to thirty minutes or by sterilizing them in an auto-clave, with steam under pressure. The latter has the advantage of creating as much pressure around the outside of the ampoule as is formed in the ampoule, thereby preventing unequal pressure which usually causes some breakage.

Some products of course will not admit of sterilization by heat, and in such instances the solutions may be filtered through a germ-proof filter and then filled into previously sterilized ampoules under aseptic conditions.

Ampoules of course are not the only safe container for sterile solutions. When large quantities of bulk solutions are dispensed, glass stoppered bottles are frequently preferable. Rubber caps such as are used by manufacturers of vaccines, form a convenient seal for a bottle of sterile solution intended to be used a little at a time. These rubber caps permit the physician to withdraw a portion of the sterile fluid with a hypodermic syringe by puncturing the rubber cap with the needle. After withdrawing the needle, this puncture closes itself, the solution remaining sterile as long as care is taken in using a sterile syringe and needle for withdrawing the solution.

You can achieve a good reputation amongst your medical friends by specializing on the production of certain preparations in a manner that will provide them with products of higher quality than those ordinarily supplied.

As an illustration I will mention ointment of yellow mercuric oxide. This preparation as ordinarily made is produced by triturating a dry mercuric oxide with an equal quantity of water and incorporating with this mixture lanolin and petrolatum or some other ointment base if desired. As you know, ointment of yellow mercuric oxide is used almost exclusively as an eye remedy. For that reason freedom from grittiness is of great importance and the finer the division of the oxide, the better the ointment you dispense.

A preparation that is far superior to one that can be produced from dry oxide can be made by precipitating the mercuric oxide from dilute solutions, washing, collecting and preparing the ointment from the moist precipitate. The preparation made in this way will contain particles of mercuric oxide so small that they are invisible when examined under a high power microscope.

It would of course be useless to prepare a very fine ointment and then dis-

pense it in a container that would subject it to contamination with dirt and dust as would be the case, if dispensed in an ordinary ointment jar. For that reason it is desirable to dispense an ointment of this kind, in a collapsible tube which is an absolute safe-guard against foreign substances accidentally becoming mixed with it. These tubes of course should be coated with a tolu varnish or other suitable medium that will prevent contact of the mercury salt and the metal.

Doctors who do their own dispensing should not be looked upon as competitors, although it is true they are in a sense, but their good will and friendship should be cultivated, as they require drugs and pharmaceutical preparations, with which you can furnish them if you will make an effort to get this business. While it may not net you the profit that you could derive if they were prescribing instead of dispensing and you could fill their prescriptions, you will nevertheless find that their business is worth while, if you can handle it on the proper basis. Aside from the dispensing physicians there are dentists, veterinary surgeons, beauty doctors and possibly others for whom you can produce various preparations profitably.

The larger your output of pharmaceutical products the greater will be the profit on the manufacturing end of your business.

#### THE MANUFACTURE OF TOILET GOODS, ETC.

Just as profitable, instructive and ethical as the manufacture of official preparations, etc., is the manufacture of toilet goods, simple household remedies, flavoring essences, food colors and other pure food products, as well as household utilities, such as cleaning fluids, furniture polish, insect destroyers, etc.

Formulas for this class of products may be found in the various formularies and reference books, as well as in the monthly trade journals, of which there are many excellent ones.

While speaking of reference books, I believe the average pharmacist does not make sufficient use of or use a sufficient assortment of such works. Every pharmacist can well afford to invest fifty to one hundred dollars in general works on pharmacy, formularies, reference works on chemistry, botany, bacteriology, aside from subscriptions for journals and Association dues, all of which are necessary means to keep one in touch with the constant progress. You will find it true almost without exception that successful men are well posted on all phases of their business and you will find that their greatest aid in keeping posted is their connection with national, state and local associations, the personal contact with men of affairs in their line afforded by such gatherings as these and the journals and reference works that do not serve as ornaments, but are read and consulted at every opportunity. In cities where local associations exist with a considerable membership, a great service is rendered if such organizations own a pharmaceutical library. In this connection I would like to say that such a library was started by the Denver Branch of the American Pharmaceutical Association in Denver a little over a year ago and we now have a reference library of approximately five hundred volumes covering practically every phase of pharmacy from merchandising and window decorating to works on bacteriology. This library was established without a great deal of expense and is proving a great help to the druggists of our city.

To resume, you will probably find that most of the formulas in the form they are published will not produce preparations entirely to your liking. We usually have our own ideas as to what this or that preparation should be and different classes of products are demanded in different localities. For that reason a little experimental work is usually necessary to perfect the preparations. Before such work is attempted, however, all reference books at your command should be consulted, and every formula for preparations of the nature or class you are trying to produce should be studied. The various hints and formulas that you will find will be of great help to you and offer many suggestions which with your practical knowledge of pharmacy will make the work of producing a satisfactory preparation, comparatively easy.

Whenever possible try to be original in your preparations. That is, your product should not suggest itself as an imitation of something already known. It should at least be an improvement over what is on the market. Individuality is always an asset.

As in the manufacture of your pharmaceutical products, it is quite essential to use the best of materials in their production. It is time enough to consider the cost when you have your formula established; you can then adjust your package and retail price so as to give you the proper margin.

With toilet preparations especially, the package is a very important factor and considerable care, thought and judgment should be used in designing it. Here, too, it is desirable to lend your package individuality. Hand lotions, creams, etc., should be well scented. Such toilet preparations as combine cosmetic properties with medicinal value should be prepared so that both points are properly taken care of. A hand lotion should have aside from a pleasant appearance, attractive package and nice odor, the medicinal quality necessary to make it a satisfactory product, so far as curing and preventing chapped skin is concerned. It should also be pleasant to use. That is, it should not be sticky, greasy, or in any other way objectionable. Any one doing or expecting to do prescription business and keep on good terms with the medical profession should not attempt to market cure-alls for every imaginable ailment. Any sensible physician will not object to household remedies such as are called for by the public for minor ailments for which physicians would not be consulted any way. But I believe that it is not within the province of the pharmacist to market dyspepsia or rheumatic cures or any preparation for the treatment of diseases or conditions properly requiring the attention of a physician nor imitate the frequently fraudulent proprietaries on the market.

A certain amount of advertising will be necessary to place your products along these lines before the public. Of printed advertising, I believe circulars or small pamphlets are the most effective. If these are gotten up in original style, are truthful and well distributed, you may be quite certain of results. One should avoid negative assertions in advertising and not be afraid to give proper publicity to all of the good qualities of the product. Of great value are window and counter displays. A great deal in fact can be said on the merchandising end of these lines but this is not within the scope of this paper.

## A COLLEGE OF PHARMACY PRESCRIPTION ROOM.

ALBERT H. DEWEY, PH. G., M. S.

Prescription work is probably the most scientific of all the work a pharmacist does in the drug store. In a sense it may be considered the keystone of the arch of pharmaceutical education since many of the other subjects are included in the curriculum to prepare the student for a proper understanding of this subject.

Because of the high character of this work both in college and in the drug store, the equipment of a prescription room in which the student receives his practice in the dispensing of prescriptions is a matter of the first importance. Since, according to my idea, the prescription room at Purdue University satisfactorily fulfills the purposes for which it was designed, a brief description of it might be of interest to the readers of the Journal.

This department occupies a corner room fourteen by eighteen and a half feet, having one east and two south windows. It is heated from an office room below by a register in the floor in order to save the space that would otherwise be occupied by a radiator. Two corner sinks, in opposite corners of the room, afford a means for washing utensils, containers, etc. Distilled water is supplied by siphons from large bottles conveniently located on top of the cases. Hot distilled water is also available, being supplied by a black-tin lined copper tank fitted with a faucet, and heated by an ordinary bunsen burner.

The furniture of the room consists of five prescription cases, one labeling desk,

Prescription Room, Purdue University School of Pharmacy, Lafayette, Ind.

and one Schwartz Sectional cabinet. The prescription cases and labeling desk were manufactured according to blueprints and specifications furnished by the Purdue School of Pharmacy. The prescription cases are of Indiana quarter-sawed oak, nine feet long by twenty-one inches wide, and have plate-glass work-tops inlaid on green felt. Below the work-top of each case are three cupboards for the larger apparatus, closed by roll doors, and a number of drawers for smaller utensils, containers, etc., while above the work-top are three sections of adjustable shelves on which are kept in regular shelf bottles the chemicals, powdered drugs, and liquid preparations of the U. S. Pharmacopœia. The labeling desk is of the same material and construction, six feet long by twenty-one inches wide and of a height convenient for use while standing. This desk has two cupboards closed by roll doors and numerous drawers in which are stored the surplus stock of labels, apparatus, and containers for use in this room.

The sectional cabinet is utilized for small and irregular containers, original bottles of alkaloids, volatile oils, etc., and the proprietaries usually kept in stock.

Each kind of work is performed at a desk especially equipped and fitted for that kind of work only. For example, suppositories are made at the suppository desk which, in addition to the necessary mortars, slabs, spatulas, etc., has a disappearing suppository machine, casseroles for melting suppository masses, rectal, infant, vaginal, and urethral molds, and in fact everything that could possibly be required in the extemporaneous preparation of suppositories. The same is true throughout the room, a specially equipped desk being used for each of the following classes of preparations: Suppositories, elastic capsules, infusions and decoctions, powders, cachets, capsules, collyria and nebula, hypodermics, solutions, mixtures, emulsions, ointments, tablet triturates, troches and pastils and pills.

Each nine-foot desk is designed for the use of two students ordinarily, or three if necessary. Thus it will be seen that fifteen students can be accommodated in this room at one time, surely as great economy of space as is practical in the drug store. In fact, conditions in the drug store have been kept in mind in fitting up this room rather than the ordinary laboratory plan for pharmaceutical or chemical work. Here, if no-where else, "Cleanliness is next to Godliness." The student is assigned to a desk for one day's work only. He finds it in good order and scrupulously clean, and he leaves it as he finds it, the apparatus being checked and inspected after each day's work. This necessitates the work of the course being done progressively instead of simultaneously, and it provides a maximum of equipment at minimum of cost.

The plan of equipping the room and carrying on the work of prescription dispensing is as nearly as possible the plan that would be followed in equipping and operating an exclusive prescription store to work fifteen clerks.

The containers used for the dispensing of the finished prescriptions are the best that can be procured. Hinged lid pill and powder boxes, partitioned boxes lined with tinfoil for suppositories, collapsible tubes as well as opaque glass jars for ointments, glass jars with perforated tops for dusting powders, are typical examples.

It has long been the belief of the writer that prescription work cannot be too

well or too elegantly done and that, in the student's practical work in this subject while in college, too much emphasis cannot be placed upon either the thoroughness of the work or the beauty and elegance of the finished product.

The graduates of colleges of pharmacy should never meet in any drug store better or more elegant dispensing than they have been taught and required to do in college; they should be accustomed to the use of the best materials, utensils, containers, in short the best of everything. They should be masters of the highest class of compounding and dispensing and trained in no other kind, for it is to these college-trained men that pharmacy must look for its ideals and its uplift in the years to come.

## REDISTILLED WATER VERSUS STERILIZED DISTILLED WATER.\*

WM. GRAY.

Pharmacists should be cautioned against using boiled distilled water as a substitute for redistilled water. Distilled water, as ordinarily handled, not only contains traces of metal and ammonia, but bacteria as well. Boiling such a specimen does not remove any bacteria that may be present, but killing them

APPARATUS FOR PREPARING REDISTILLED WATER

1—Distilling of Jena Glass 2—Hjeldahl Tube of Jena Glass 3—Vertical Condenser 4—Wood box protection against dust and microorganisms 5—Receiving flask of Jena Sol Glass

produces a suspension of them, which, when administered intravenously, acts like a vaccine. Chills, temperature and other complications often result from using water of this kind. This is neither desirable nor necessary, as the difficulty is easily overcome by redistilling the water in hard glass, such as Jena or Non-Sol. The water should be *aseptically* cared for, and used within an hour

\* Read before Chicago Branch, A. Ph. A., May 18, 1915.

after redistilling. For this reason the aqua distillata sterilisata of the next pharmacopœia is open to the same criticism, since unless the freshly distilled water is *collected aseptically*, the subsequent boiling to sterilize it will as likely produce a vaccine as when made from an older distilled water, only in a lesser degree.

Here we have an apparatus that is inexpensive and does the work. Pharmacists should get busy if they want to meet the demands of up-to-date practitioners, who require *freshly distilled* water for preparing or having the pharmacist prepare salvarsan, physiological salt and other solutions for intravenous use.

If one cares to put up ampoules wherein such water is always used as a solvent, I think it will pay to do so—if not directly, then indirectly, in added prestige with physicians who direct their prescriptions towards your establishment. Examples of such ampoules are sodium cacodylate, a substance which has almost superseded Fowler's and Pearson's solutions in chorea and anæmia—iron and arsenic are used particularly in pernicious anemia. Emetine hydrochloride in amebic dysentery and pyorrhea has brought wonderful results, and as a consequence, the price of ipecac is soaring. There are too many substances used in ampoule form to mention all—I simply call attention to the above medicaments because the demand for them is increasing.

The technique necessary for this work is to use sterile utensils. Ampoules must be of hard glass, either Jeno or Non-Sol. *Hard glass is very essential*, soft glass being more or less soluble, especially when sodium chloride is used to make the solution isotonic, the powerful sodium and chlorine ions acting on soft glass. Solutions must be neutral. Ampoules may be filled by using a burette with rubber connection with glass tube drawn to a fine point or with a hypodermic syringe. The filled ampoules should be heated to the boiling point before sealing in the flame, so that they may be placed in boiling water for thirty minutes each day, for three successive days.

---

## A METHOD FOR THE DETERMINATION OF CARBON DIOXIDE IN BAKING POWDER AND CARBONATES.\*

---

H. W. BRUBAKER.

---

The following is the result of an attempt to devise a method for the determination of the available carbon dioxide in baking powders, which is simple in principle, requires an apparatus easy to construct, and manipulate, consumes little time and gives reasonably accurate results. The method was devised for the use of a class of girls in household chemistry. It is adapted not only to the determination of carbon dioxide in baking powder but also in carbonates, bicarbonates and minerals such as limestone and dolomite.

The principle of the method, in brief, is the liberation of the carbon dioxide.

---

\*From Journal of Industrial and Engineering Chemistry, May, 1915.

causing it to displace its own volume of a saturated solution of sodium chloride into a graduated cylinder and measurement of the volume of the solution displaced. A saturated solution of salt is used because carbon dioxide is not readily dissolved in it and tests show that under the conditions of the experiment the amount of absorption is so small that it may be neglected. A saturated solution of salt is also used, instead of water, in the decomposition of the baking powder. The principle of collecting carbon dioxide over a saturated solution of sodium chloride is used by Jago in determining the strength of yeast.

#### PROCEDURE.

One gram of the baking powder is placed in the flask *A*. Water is circulated through the condenser for several minutes. The cylinder *B* is nearly full and the delivery tube *C* is full, to the open end, of a saturated solution of salt, the pinch clamp being closed. The stopcock in the funnel *D* is now closed and exactly 25 cc. saturated solution of salt placed in the funnel. The pinch clamp on the delivery tube is now opened and the salt solution run in from the funnel by opening the stopcock, care being taken not to admit any air. The carbon dioxide begins to be liberated at once and the salt solution is driven over into the graduated cylinder *E*. The decomposition of the baking powder is completed by heating with the gas burner until the solution has boiled for two or three minutes or until the rise of the salt solution in the cylinder *E* is seen to have stopped. The flame is then turned out and the apparatus allowed to stand

until it has cooled to room temperature again. The cooling of the flask *A* can be hastened, if desired, by lowering the ring and bringing a beaker of cold water up under the flask until it is immersed in the water. When the apparatus has reached room temperature the salt solution in *E* and *B* is leveled up by raising *E*. The pinch clamp is then closed; the cylinder *E* is lowered to the table, the delivery tube removed and the volume of salt solution in *E* read. Subtract 25 cc. from this volume to compensate for the 25 cc. of salt solution which were run into the flask *A* to decompose the

baking powder. Correct the remaining volume to 0° C. and 760 mm. pressure. As 5.1 cc. of carbon dioxide gas at 0° C. and 760 mm. pressure weigh 0.01 gm., which is one percent of 1.0 gm., the percent of carbon dioxide in the baking powder may be found by dividing the corrected volume by 5.1.

NOTE: In making the correction for aqueous tension I have used that for pure water which is two or three mm. too high in each case. The effect of the small error thus introduced into the results here recorded is to make them too low.

## RESULTS.

The purpose of the condenser in the apparatus is to prevent any water from distilling over into the cylinder *B* and thus diluting the salt solution. Table I shows some results obtained with various baking powders:

Table I—Analyses of Baking Powders for CO<sub>2</sub>

Sample	Vol. CO <sub>2</sub> cc.	Temp. ° C.	Barometer mm.	Percent CO <sub>2</sub>
Baking Powder				
Royal A 1.....	65.0	20	740	11.30

In order to ascertain whether an appreciable amount of carbon dioxide is absorbed by the salt solution during a determination, 90 cc. of carbon dioxide were run into the apparatus at 22° C. and 740 mm. and allowed to stand two hours and forty minutes, at the end of which time the volume was 90.3 cc. and the temperature 23° C., the pressure having remained the same. The increase in volume is very close to that which would result from the increased temperature.

In applying this method to the determination of carbon dioxide in carbonates such as sodium carbonate and precipitated calcium carbonate the sample was decomposed by means of a dilute solution of hydrochloric acid which was saturated with sodium chloride. The absorption of carbon dioxide by the acid solution is appreciable and must be allowed for. This is done by decomposing one sample with 10 cc. of the acid solution, then running a second determination, using 15 cc. of acid. The difference in the amounts of carbon dioxide obtained in the two cases being due to the absorption by 5 cc. of acid solution, the proper correction is made on either determination. When decomposing precipitated carbonates with hydrochloric acid no heating is necessary, hence the time consumed in each determination is very short, but two or three minutes being required for the liberation of the carbon dioxide. In running two samples of calcium carbonate in this way, the whole process, including the weighing of the samples, required only ten minutes.

Table II shows some of the results obtained on carbonates. In Determinations 1 and 2 heat was used. In Determination 3 no heat was used. The sample of sodium carbonate used in Determinations 4 and 5 was found to contain 4.46 percent of moisture. The theoretical amount of carbon dioxide in this sample is therefore 39.65 percent. Some of this sodium carbonate was now dried and Determination 6 made upon the dry sample with the result shown. Allowing for the same absorption as in Determination 5, which is 2.97 cc., gives a total volume of 121.17 cc., under the above conditions of temperature and pressure which correspond to 41.38 percent of carbon dioxide.

Determination 7 was made on a sample of limestone. It was necessary to use heat to completely decompose the sample with the acid solution. I had no gravimetric determination of carbon dioxide in this limestone against which to check the result. However, according to the figures of another analyst, the limestone contains 12.28 percent SiO<sub>2</sub>, 1.15 percent Al<sub>2</sub>O<sub>3</sub>+Fe<sub>2</sub>O<sub>3</sub>, 46.74 percent

CaO and 1.38 percent MgO, making a total of 61.55 percent, which leaves for carbon dioxide 38.45 percent. This makes no allowance for potassium and sodium which may be present in very small quantities. The result is undoubtedly a close approximation to the actual percentage of CO<sub>2</sub> present.

(a) By difference; see text.

NOTE: Since sending this paper for publication I have found a convenient way of obviating the necessity of making a correction for the absorption of carbon dioxide in those cases where the sample is decomposed by dilute acids. This makes it unnecessary therefore, to decompose more than one sample of the substance for one determination. The procedure is as follows: Just before making the determination pour 30 or 40 cc. of dilute hydrochloric acid (1 acid : 3 water) on 0.5 gm. of precipitated calcium carbonate. When the effervescence has ceased, and the acid solution has become clear, pipette 10 cc. of this into the bulb of the separatory funnel and proceed with the determination. This method of saturating the acid with carbon dioxide requires but a moment and makes it unnecessary to correct for any absorption whether the sample is decomposed by heating or at room temperature. The following determination will illustrate the accuracy of this method of procedure:

Wt. of limestone taken.....	0.5 gm.
Volume of salt solution displaced.....	138.18 cc.
Temperature, 22° C. Barometer.....	739 mm.
Volume corrected to 0° C. and 760 mm.....	112.3 cc.
Percent CO <sub>2</sub> found.....	44.03
Theoretical percent CO <sub>2</sub> .....	44.00

## SCHUESSLER'S TWELVE TISSUE REMEDIES.\*

---

FREDERICK J. WULLING.

---

Because I have had numerous inquiries of late from pharmacists and physicians concerning the twelve tissue remedies, it occurred to me as quite probable that many pharmacists of the state are not familiar with them and that a brief reference to them would be acceptable. Because these remedies are as a rule not used by the regular allopathic physician they are sometimes ridiculed, and to avoid any error in statement concerning them I will quote very largely from the literature on the subject.

Dr. W. H. Schuessler, of Oldenburg, something over forty years ago, inspired by the discoveries of such able scientists as Virchow and Moleschott, gave the world a new system of medicine founded upon the "scientific laws of cellular pathology." This system is also called the bio-chemic system of medicine. Concerning this bio-chemic theory I find the following explanations:

"The blood and tissues of human beings are composed of water, albumen, sugar, fats and inorganic salts. The relative proportion of the inorganic salts is small, yet the life and vitality of every cell in the human organism is dependent upon the presence of the necessary quantities of these inorganic constituents. This system deals with twelve remedies, which in composition correspond with the inorganic elements found in the human body. These remedies should properly be called the cell salts, but are today generally known as the Schuessler Twelve Tissue Remedies, no doubt as a tribute to their distinguished discoverer. The cell salts are the real energies in the body, the workers, the builders. The water and organic substances are inert matter used by these salts in building the cells of the body. Each salt has a special work to do; each has an affinity for certain organic materials used in building up the human frame. Thus, for instance, chloride of potassium (Kali Mur.) molecules work in fibrin. If a deficiency occurs in this salt a portion of the fibrin not having workers becomes a disturbing element and may be thrown out of the circulation through the nasal passages, lungs, bowels, etc., producing conditions called catarrh, colds, coughs, etc. As soon as a deficiency or unequilization of one or more of these salts occurs, a disturbance arises known as disease, and a symptom is set up in order that the intellect may heed and supply the want. Schuessler says: 'In all diseased conditions a deficiency of one or more of the inorganic elements (tissue salts) exists. Supply these elements and a normal condition will be restored.'

Virchow, the originator of the famous cell theory upon which the tissue remedies are based, Moleschott of Rome, and others were deeply interested in cellular pathology and proclaimed the truth of bio-chemistry, but it remained for Dr. Schuessler to develop their discoveries into a comprehensive and definite system

---

\* Mostly quoted.

of medicine. He was the originator of the twelve tissue remedies, with which curable diseases can be successfully treated."

The twelve remedies are:

Calcarea Fluorid (Calcium Fluoride)  
Calcarea Phos. (Calcium Phosphate)  
Calcarea Sulph. (Calcium Sulphate)  
Ferrum Phos. (Iron Phosphate)  
Kali Mur. (Potassium Chloride)  
Kali Phos. (Potassium Phosphate)  
Kali Sulph. (Potassium Sulphate)  
Magnesia Phos. (Magnesium Phosphate)  
Natrium Mur. (Sodium Chloride)  
Natrium Phos. (Sodium Phosphate)  
Natrium Sulph. (Sodium Sulphate)  
Silicea (Silicic Acid)

It is said that these twelve remedies work in harmony with the natural laws of physiological chemistry. They cure by supplying through the blood a deficiency existing in abnormal conditions.

"The salts in their crude state are physiologically inert and cannot be absorbed through the minute cell walls of the tissues. Nature works everywhere with infinitely small atoms which can only be perceived by the human eye when presented in masses. An infinitely fine sub-division of the salts is necessary in order to enable the cells to abstract from the blood their affinitive inorganic elements. This sub-division can be accomplished by a scientific trituration process originated by Dr. Schuessler. In this form it is possible to supply through the blood nutriment to every organ by transudation through the capillary walls. The dosage of these remedies is necessarily small, for it must be remembered that the entire quantity of these inorganic salts in the system is proportionately small and a minute deficiency may cause a disturbance."

Those who desire further information are referred to Carey's Bio-Chemistry, published by the Luyties Pharmacy Company, St. Louis, Mo., and to the Homeopathic Pharmacopoeia.

At the Detroit meeting of the American Pharmaceutical Association, held in August, 1914, Mr. George M. Beringer, of Camden, N. J., read a paper dealing with homeopathic pharmacy, in which he held that pharmacists generally should know more about homeopathic pharmacy. This is practically the position I have always taken. While the great majority of homeopathic physicians give remedies to their patients free of cost, I know of some who write prescriptions for homeopathic remedies. There are also numerous instances where allopathic and eclectic physicians write prescriptions for homeopathic remedies.

## THE PHARMACY OF USEFUL DRUGS.\*

---

M. I. WILBERT.

---

Soon after the organization of the Council on Pharmacy and Chemistry of the American Medical Association in the early spring of 1905, it became evident that much of the then existing misuse of proprietary remedies was due to the fact that by far the greater number of medical practitioners had received but inadequate instruction regarding the possible uses and limitations of official and other widely used medicines. It was also recognized that with the limited amount of time that could be devoted to materia medica subjects in the already overcrowded curriculum of medical schools, it would be practically impossible to present even a superficial view of the four or five thousand drugs and preparations in every-day use.

As the fundamental object of the Council on Pharmacy and Chemistry is to develop and to foster the intelligent, scientific use of medicinal preparations in the treatment of disease, it became necessary to consider the practicability of bringing about a change in the then existing condition. At the meeting of the American Medical Association in Boston in 1907 the problems involved were discussed and on the recommendation of the Section on Pharmacology and Therapeutics, a subcommittee of the Council was appointed to consider ways and means to bring about more efficient instruction in materia medica subjects. The subcommittee, after due consideration, came to the conclusion that teachers in materia medica subjects in medical schools felt that it was necessary to impart a smattering of information in regard to a large number of medicines and drugs and their preparations because members of State Medical Examining and Licensing Boards were likely to ask questions regarding them. Members of State Medical Examining and Licensing Boards, on the other hand, thought it desirable to ask questions regarding the many thousands of official and non-official drugs and preparations because teachers of materia medica subjects referred to them in their lectures and discussed them in their textbooks. From this conclusion it became evident that if the members of State Medical Examining and Licensing Boards could be induced to restrict their examinations in materia medica subjects to a more limited list of articles more time could be devoted to their study. Conversely, if instruction in materia medica subjects could be restricted to the comprehensive consideration of a reasonably limited number of widely used and thoroughly well established articles the student could be given a thorough grounding in the properties and uses of the several drugs and preparations and this would go far toward eliminating many, if not all, of the then existing abuses.

The acceptance of such a list of useful drugs, it was further thought, might

---

\* Presented at the meeting of the Pennsylvania Pharmaceutical Association, Forest Park, Pa., June 22-24, 1915.

serve as an added incentive for the development of international standards for purity and strength of widely used medicaments.

The original list was compiled in co-operation with the Council on Medical Education of the American Medical Association and was subsequently submitted to members of the National Confederation of State Medical Examining and Licensing Boards. It was later submitted to teachers of materia medica and therapeutics in medical schools and to members of State Medical Examining and Licensing Boards, and finally, through the columns of the *Journal of the American Medical Association*, to medical practitioners generally.

The principles guiding the inclusion of articles in the list of useful drugs were primarily based on the continued extensive use of a drug or preparation, on the reports of clinical experiments as reflected in current literature and on the reports of experimental work done in pharmacologic laboratories and in hospitals equipped with proper laboratory facilities.

Recognizing the influence of current medical literature even when evidently of an advertising nature, the Council has included in the list of useful drugs a number of articles not now included in the *Pharmacopœia of the United States* or to be included in the revision now in press.

In round numbers the present list of useful drugs includes 450 titles, of which 231 may be classed as drugs and chemicals, 173 as preparations, 43 as definitions of forms of drugs, and 13 as cross references.

As suggested above the list is primarily intended to be educational and to reflect as nearly as is practical the best medical practices of the time. The object is not to restrict teaching in medical schools to this list but to make sure that medical students are given a comprehensive and satisfactory training regarding the properties and uses of the several articles and are duly impressed with their shortcomings and limitations.

It is satisfactory to note in this connection that teachers in medical schools generally have evidenced an appreciation of the need for devoting an additional amount of time to the consideration of the more important medicaments and there is now a fair prospect that future graduates in medicine will be given ample instruction to develop an efficient therapeutic aramentarium.

The pharmacy of this list of useful drugs has as yet not received the care and attention that is properly due it. Pharmacists generally do not appear to realize that much, if not all, of the dissatisfaction with established or well-known drugs is due to the fact that as these drugs reach the patient they are frequently not strictly in accord with the requirements of established standards.

The compilation of data from the reports of State Boards of Health and of State Food and Drug Inspectors, as presented in the several volumes of the "Digest of Comments on the *Pharmacopœia of the United States* and on the *National Formulary*," clearly shows that fully 50 percent of the more widely used preparations do not comply within reasonable limits with official requirements. The chemist of the Maine Agricultural Experiment Station in a recent comment on this shortcoming, says in part:

"It is rather startling to find that half of the pharmaceutical preparations examined, which are as simple to make as a batch of biscuit, differ more than 10 percent from the standard."

The object of pharmacy is to exercise control over the identity and purity of articles used as medicine and while it is generally admitted that the average pharmacist cannot well be expected to systematically examine all of the thousands of articles carried in stock, there is practically no reason why he should not concentrate his efforts and ability on the limited number of articles included in the list of useful drugs so as to assure physicians and others that the articles included in this list will uniformly comply with the official requirements.

As noted above the list is intended to include only such drugs and preparations as are in general use or are accepted as having well established medicinal value or demonstrated superiority. The list at the present time includes practically all of the preparations of the Pharmacopœia of the United States for which standards and assay processes are included and also includes practically all of the widely used household remedies that are frequently examined and reported on by officials entrusted with the enforcement of food and drug laws and for these reasons alone pharmacists would do well to consider the practicability of devoting additional attention to the systematic examination and control of the several articles.

With the impending revision of the Pharmacopœia and of the National Formulary, the Council is about to revise the list and teachers in medical schools, members of State Medical Examining and Licensing Boards and others are being consulted at the present time in regard to the practicability or desirability of omitting from and adding to the list of useful drugs.

In this connection it should be remembered that the members of the Council fully realize that individually or as a body they are neither omniscient nor infallible. From its very origin the Council has courted the co-operation and assistance of not alone medical men but also pharmacists.

In the revision of the list under discussion it is particularly important that pharmacists should be given an opportunity to record their criticisms and opinions of the list and its objects and to suggest ways and means for inducing pharmacists generally to prepare and to dispense the preparations included in the list in accord with official requirements.

As has been pointed out before we, in this country, are sadly in need of more energetic and more effective control of all drugs and medicines. The only really safe and efficient control involves honesty, knowledge, intelligence and care on the part of the person dispensing the medicine to the consumer so that unless pharmacists as a class can be induced to devote special attention to the systematic examination and control of drugs and preparations widely used in the treatment of disease, the manufacturers of specialties or proprietaries will continue to have a reasonable argument with which to approach the physician. In conclusion it may be stated that pharmacists as a class may well endeavor to secure for themselves and for their craft the recognition and respect that is properly their due for services rendered but it will be practically impossible to do this unless they collectively and individually insist that all members of their craft live up fully to the requirements that may be reasonably made of them.

## FULLER'S EARTH; ITS ADSORPTIVE POWER, AND ITS ANTIDOTAL VALUE FOR ALKALOIDS.\*

BERNARD FANTUS, M. D.

For several decades fuller's earth (Parsons<sup>1</sup>) has been used extensively for the removal of coloring matter from oils. It owes this use to its capacity for adsorbing basic colors from solutions, which resides in the finest particles of the clay. The union between the basic substance and the earth is believed to be physical, as it can be easily broken up by use of proper solvents.

In 1910, John Uri Lloyd,<sup>2</sup> of Cincinnati, discovered that the addition of fuller's earth to alkaloids greatly diminished or almost abolished their bitter taste and that most alkaloids could be quantitatively removed from solutions by means of it. Further research revealed that this activity resided in the finest particles of the earth, which Lloyd separated by elutriation from the coarser portion and to which the name "Lloyd's reagent" has been applied.

In view of the theoretic interest as well as the practical possibilities inherent in this property of fuller's earth, this research was undertaken to determine, first, the relation of alkaloids to "Lloyd's reagent" and to various other specimens of fuller's earths; and, secondly, to see to what extent the action of various alkaloids may be modified by combination with these earths. Lloyd, Eli Lilly & Co., and various producers of fuller's earth have kindly supplied liberal quantities of material, by means of which the following data were obtained.

### THE ALKALOID ADSORBING QUALITY OF VARIOUS SPECIMENS OF FULLER'S EARTH.

This was studied by briefly shaking accurately measured quantities of alkaloidal solutions with varying amounts of fuller's earth, filtering and then testing the filtrate for the alkaloid to determine the smallest amount necessary to remove the alkaloid from the solution. The figures given in Tables 1 and 2 show how many parts of fuller's earth had to be used to remove 1 part of alkaloid from solution. There is some difficulty in deciding on the end-point in these determinations, owing to the fact that water dissociates the combination to a slight extent, so that it is almost impossible to get rid of traces of the alkaloids in the filtrate. Therefore the smallest amount of fuller's earth that would remove the alkaloid as thoroughly as a larger amount was the quantity looked for.

In Table 1, the various earths have been arranged in order of their adsorptive power. It must be understood that the figures given in this table are only of relative value. Slight modifications in the technic of the test give quite different results. Nevertheless, when the same technic was applied to each of the differ-

<sup>2</sup> Lloyd, John Uri: Lloyd's Reagent—Preliminary Announcement, Jour. Am. Pharm. Assn., May, 1914, iii, No. 5, p. 625.

ent specimens, their relative position in the table was well maintained. It must furthermore be realized that the adsorptive power of fuller's earth from various sources depends, to a certain extent, on the degree and uniformity of fineness of the specimen. Mere sifting raises the

\* The figures in the first three columns indicate parts by weight of the respective earths required to remove from solution 1 part of the substance named at the head of the column. The figures in the fourth column indicate cc. of tenth normal sodium hydroxide needed to neutralize 100 gm. of fuller's earth, phenolphthalein being used as indicator. The specimens are arranged in order of adsorptive power. Variations in adsorptive power of different specimens from the same source have been noted.

† Drying would reduce activity somewhat.

latter being merely less pure than the former. That this is the case can be readily seen by comparing the composition of kaolin (Watts<sup>3</sup>) with that of fuller's earth (Vaughan<sup>4</sup>) and of Lloyd's reagent (Waldbott<sup>5</sup>).

	SiO <sub>2</sub>	Al <sub>2</sub> O <sub>3</sub>	Fe <sub>2</sub> O <sub>3</sub>	CaO	MgO	Alkalies	Water
Kaolin .....	45.40	37.34	1.92	0.44	0.20	0.52	14.0
Fuller's Earth .....	57.26	18.33	1.87	2.58	1.06		18.4
Lloyd's Reagent ....	55.30	9.82	14.80	1.58			17.41

It is an interesting question, why such great difference in adsorptive power exists among these substances. The following theories present themselves: First, it might be due to a physical difference, namely, the amount of colloidal material present; secondly, it might be due to difference in reaction; thirdly, it might be due to difference in chemical composition.

<sup>3</sup> Watts, A. S.: Mining and Treatment of Feldspar and Kaolin, Bull. 53, Dept. of the Interior, Bureau of Mines, 1913, p. 37.

<sup>4</sup> Vaughan, T. W.: Fuller's Earth Deposits of Florida and Georgia, Bull. 213, Dept. of the Interior, U. S. Geo. Survey, 1902, p. 393.

<sup>5</sup> Waldbott, Sigmund: Precipitation of Alkaloids by Lloyd's Reagent, Jour. Am. Chem. Soc., June, 1913, p. 837.

## THE AMOUNT OF COLLOID IN FULLER'S EARTH.

Ashley<sup>6</sup> believes that the power of adsorbing certain dyes by clay supplies a measure of the amount of colloid present. He selected malachite green as the best dye known for this purpose, as it is wholly non-colloidal. Colloidal dyes, even if as feebly colloidal as methylene blue, introduce complicating factors that vitiate results, as may be seen by comparing the figures for malachite green with those arrived at with methylene blue: of Specimen F 40 times the amount was required, of Specimen D 60 times, of Specimen E 50 times, of Midway, Fla., fuller's earth 60 times—figures the are very near together in spite of great difference in alkaloid adsorbing power of these various specimens. Ashley agitates the clay with the dye solution for an hour, by means of a small ball mill, permits the clay to settle over night, and determines the amount of malachite green adsorbed by comparison with dilutions of a standard solution of malachite green. He found that half an hour's settling gave results that were too erratic, in view of the slow sedimentation of some specimens of fuller's earth. It must be understood that colored colloidal material in suspension makes the solution appear darker, so that it would seem less color was adsorbed, leading to the judgment that that clay is less colloidal, when it would be actually more colloidal than another clay that settled readily. I believe I have hit on a much less troublesome, more rapid and probably as accurate method of estimating the adsorptive power of fuller's earth by means of malachite green. The addition of a small quantity of an alkaloid, for example, morphine, to a fuller's earth suspension produces immediate deflocculation. On the other hand morphine does not readily salt out the malachite green. I therefore used in the determination of the malachite green figures (Tables 1 and 2) a solution of the following composition:

Malachite green .....	1.0
Morphine sulphate .....	2.5
Distilled water to.....	1000
Filter after prolonged agitation.	

The amount of fuller's earth needed to remove a certain quantity of malachite green from this solution, expressed in multiples of that quantity, is represented by the figures in Table 1. It will be noted that these figures run quite closely parallel to the figures indicating alkaloid adsorptive power. Other electrolytes, for example, sodium chloride, also produce deflocculation of suspended fuller's earth. However, considerably larger quantities of sodium chloride are needed to produce this result promptly: quantities that are capable of salting out the malachite green, thus interfering with the test.

From Tables 1 and 2 it will be seen that the adsorption of malachite green runs parallel with the adsorption of alkaloids, and is therefore presumably due to the same cause. To use this adsorption as a measure of the amount of colloid present, as is proposed by Ashley, merely rests on the assumption that it is due to colloid. It does not prove that this is the case. Inasmuch as other colloids experimented with, such as colloidal aluminum hydroxide, colloidal ferric hydroxide, colloidal silicic acid, mastic emulsion, do not have the power of adsorbing alkaloids to nearly the same degree as active fuller's earth, it is reasonable

<sup>6</sup> Ashley, Harrison Everett: The Colloidal Matter of Clay and Its Measurement, Bull. 388, U. S. Geol. Survey, 1909.

to assume that we have here a case of specific adsorption; and that, while no doubt the colloidal state is necessary for this effect, it is not the essential cause of it.

#### THE "ACIDITY" OF FULLER'S EARTH.

To determine whether the acid reaction generally displayed by fuller's earth is the cause of the effects observed, the degree of "acidity," or rather the power of the earth to adsorb bases, was determined for each specimen by titration of 2 gm. of the earth, suspended in 100 cc. of distilled water, with tenth normal sodium hydroxide, using phenolphthalein as an indicator. *A priori* one might expect that the power of adsorbing alkali would be proportionate to, or at least run parallel with, the power of adsorbing alkaloids. This, however, is not the case, as can be seen by a glance at Table 1. Nevertheless, specimens devoid or practically devoid of acidity, like kaolin or Pear's precipitated fuller's earth, fail to adsorb alkaloids and those of lowest acidity are lowest in the list of alkaloidal adsorbents. Hence the presence of "acidity" is necessary to enable fuller's earth to adsorb alkaloids; though its degree is by no means a measure of the degree of this power. It therefore appears there are at least two factors involved in the adsorption phenomenon under consideration: the one the "acidity," the other the colloidal state. Whether the reason for the comparatively high adsorptive power of "Olson" and "Lester" fuller's earth, in spite of their rather low "acidity," is due to a relatively higher content of colloid than is present in more acid earths of lower activity, or whether there are two different "acidities" involved, one of importance in adsorption of alkaloids and the other not, remains to be settled. Nor have I the data at hand, at present, to discuss with any degree of profit the other theory previously advanced. On work on these questions I hope to report in the near future.

TABLE 2.—Proportion of fuller's earth needed to remove one part of alkaloidal salt from solution.

Alkaloidal Salt	Lloyd's Reagent	General Reduction Co	Olson Fuller's Earth	Lester Fuller's Earth
Morphin sulphate	8	20	26	36
Quinin bisulphate	10	30	41	50
Nicotin hydrochlorid	20	50	100	110
Cocain hydrochlorid	20	75	95	150
Aconitin nitrate	50	70	100	120
Strychnin sulphate	40	100	120	200
Colchicin hydrochlorid	120	160	200	
Malachite green	50	65	70	100

The addition of Congo-red to fuller's earth enables one to determine roughly, but quickly, the presence and degree of "acidity." It will be seen (Table 1) that all the earths that gave a blue or purple color with Congo-red were found active, while with the inactive kaolin there was no change; the others produced intermediate tints.

#### THE ADSORPTION OF VARIOUS ALKALOIDS BY FULLER'S EARTH

It will be seen from Table 2 that the various alkaloids differ in their relation to fuller's earth. For instance, a smaller quantity of an earth is needed to remove a morphine than a quinine salt; and less fuller's earth is needed to remove quinine bisulphate than strychnine sulphate. Colchicine needs the largest amount. As will presently be seen, these relations are significant in connection with the antidotal value of fuller's earth for these different alkaloids.

#### THE ACTIVITY OF ALKALOIDAL FULLER'S EARTH COMPOUNDS.

The alkaloidal fuller's earth compounds resist dilute acid; but are decomposed by alkalies, even as dilute as fiftieth normal sodium carbonate, which is approxi-

mately the alkalinity of the intestinal juice. When fuller's earth compounds of various alkaloids are treated with fiftieth normal sodium carbonate solution and the solution is acidified, it yields precipitates with Mayer's reagent, apparently in proportion to the solubility of the free alkaloid in water: the nicotine precipitate is much more copious than that obtained with cocaine; and the latter more abundant than the aconitine or the strychnine precipitate. Emetine yields only a trace. The concentration of the morphine solution obtained under these circumstances is below the threshold of distinct precipitation by Mayer's reagent, as is also a saturated solution of morphine in water;

through the stomach without acting on this viscous and without being acted on. On arriving in the intestine, they are gradually dissociated into their constituents, yielding the alkaloid to absorption. This explains why the general action of alkaloids, administered in this combination, is markedly delayed; and why a larger dose is needed to obtain the same effect.

This modification of the action of alkaloids is of toxicologic, of pharmacodynamic, and of therapeutic interest. The diminution of taste, for instance, obtained in this manner has made it possible to produce perfectly pleasant sweet tablets of strychnine (Fantus<sup>6</sup>) for administration to children. The absence of effect on the stomach might be of value in connection with some of the alkaloids. Though, in case of ipecac, the removal of the emetic action by means of fuller's earth also seems to destroy action on certain infusoria, as I have found in as yet unpublished experiments. The delayed absorption might increase the effect on the intestine and its contents; for example, the quinine combination might exhibit

it yields, however, a copious precipitate with phosphomolybdic acid. Colchicine does not, of course, precipitate with Mayer's reagent, but does with tannic acid.

In view of this dissociability of the alkaloidal fuller's earth compounds by very dilute alkali, it is easy to understand why they become active in the animal body in spite of the fact, as Gordin and Kaplan<sup>7</sup> have shown, that the digestive ferments have no disrupting effect on these compounds. Being insoluble in acid liquids, even in the presence of pepsin, they pass

amebicidal action in the intestine. The delayed absorption of cocaine may make the cocaine combination of value as an antipruritic in weeping skin disease. Work on some of these questions is being carried on at present.

#### THE NAMING OF THE ALKALOIDAL FULLER'S EARTH COMPOUNDS.

Inasmuch as some of these alkaloidal fuller's earth compounds are likely to prove of therapeutic value, it might be well to discuss the terms that have been applied to them. Lloyd named these "alcresta" alkaloids. It is under this title that Eli Lilly & Co. propose to place them on the market. The name is unfortunately not descriptive of the nature of the compound.

McGuigan<sup>9</sup> has applied the name "colloidal" strychnine to the strychnine compound with fuller's earth; a name I believe to be erroneous, as the moment the combination between the colloid and the alkaloid occurs, the colloidal state is destroyed and a coarse suspension results, as may be shown by the readiness with which morphine produces deflocculation of a fuller's earth sol or gel. It appears to me that the best name to apply to the strychnine compound would be "strychninated fuller's earth"; to the morphine compound "morphinated fuller's earth"; to the cocaine compound "cocainated fuller's earth," etc.; terms analogous to "chlorinated lime" and "sulphurated potash."

Lloyd first hoped that his reagent would prove a universal antidote for alkaloids and he describes it as one of the bitterest disappointments of his life when it was shown by Dr. Felter, in 1911, that the combination of Lloyd's reagent with strychnine was still capable of killing a dog in convulsions. Lloyd suggested to me that the addition of tartaric acid or of stearic acid to his reagent might raise its anti-

<sup>9</sup> McGuigan, Hugh: A Colloidal Compound of Strychnine and Its Pharmacology, The Journal A. M. A., November 28, 1914, p. 1933.

dotal value. It will presently be seen that this is indeed the case with tartaric acid. Experiments with the stearic acid combination proved negative.

The experiments recorded below were undertaken primarily to study the toxic action of alkaloidated fuller's earth. It soon became apparent, however, that fuller's earth did possess antidotal value against certain alkaloids, while it had little value against others, as will be shown by the following data.

#### ANTIDOTAL VALUE IN STRYCHNINE POISONING.

The antidotal value of fuller's earth in strychnine poisoning in the rabbit may be estimated from Tables 3 and 4. It will be seen in Table 3 that 5 mg. per kilogram is invariably convulsive and frequently fatal for small rabbits; that, on the other hand, a large rabbit (A 4) showed no effect from such a dose. Eliminating, therefore, the only other large rabbit in this series (D 5) from consideration, we find that fuller's earth alone is not antidotal to strychnine. The addition of tartaric acid or of sodium dihydrogen phosphate to the fuller's earth renders it, however, capable of preventing convulsions and of saving life in small rabbits, even if administered five minutes after the poison has been given. The sodium dihydrogen phosphate showed itself superior to the tartaric acid by having this effect invariably, while with the tartaric combination convulsions and deaths have occurred. The dose of 10 mg. per kilogram (Table 4) is invariably fatal; and yet the addition of tartaric acid or of sodium dihydrogen phosphate to fuller's

earth has enabled it to prevent effects, if administered at the same time; but not, if administered five minutes later. Against 15 mg. per kilogram, fuller's earth with sodium dihydrogen phosphate has been useless so far as saving of rabbits is concerned; but it, no doubt, postponed the effects to a considerable degree, as will be seen from the following observations:

TABLE 6.—Effect on rabbits of fatal doses of Morphine given orally with and without Fuller's earth.

Rabbit	Dose				Effects	
	No.	Weight gms.	Morphine 5 mg. per kg.	Acetate or tartaric acid followed by Fuller's Earth	Symptoms	Result
A 1	1	840	1 gm.	0	Large course in 2 hrs.	Death in 2 hrs.
B 1	1	760	1 gm.	5 mg.	Some depression	Recovery
C 1	1	1,000	1 gm.	5 mg.	Some depression	Recovery
D 1	1	1,100	2 gm.	5 mg.	Some depression	Recovery
B 2	2	800	1 gm.	10 min. later	Some depression	Recovery
C 2	2	1,000	1 gm.	15 min. later	Some depression	Recovery
D 2	2	1,100	1 gm.	20 min. later	Large course in 2 hrs.	Death in 2 hrs.
D 4	4	900	1 gm.	20 min. later	Large course in 2 hrs.	Death in 2 hrs.

Rabbit D 10, weighing 907 gm. was given 0.015 gm. strychnine with 4.50 gm. each of fuller's earth and of sodium dihydrogen phosphate. Death occurred in four hours and thirty minutes.

Rabbit D 11, weighing 2,660 gm. was given 0.040 gm. of strychnine with 13.3 gm. each of fuller's earth and sodium dihydrogen phosphate. Death occurred in thirty-two hours.

Table 5 shows that a dose of 2 mg. per kilogram is invariably fatal to dogs. The addition of fuller's earth saved life, but did not prevent convulsions. The addition of tartaric acid and of sodium dihydrogen phosphate frequently prevented convulsions and generally saved life. However, emesis was so frequently produced as to vitiate the results. Therefore morphine was given about one hour before the administration of the poison. This preliminary administration of morphine, of course, produced vomiting and often defecation within the hour, followed by a depression of the vomiting center, so that the doses were now regularly retained. Experiments A 3 to A 6 (Table 5) show that the morphine does not save the life of the animal, though it delays results. Experiments D 3 to

D 6 show that fuller's earth and sodium dihydrogen phosphate are capable of saving life, even though no emesis takes place. The fact that it was possible to save the life of morphinized dogs, even if the antidote was given five, ten and fifteen minutes after the poison, while the antidote failed to produce such result without the morphine, is most interesting and requires further study. Possibly it is due to delayed evacuation of the stomach.

A dose as large as 4 mg. per kilogram makes demands on the antidote that it is not able to meet, as will be seen from the following experiments:

Dog C 6, weighing 9 kg., was given, at 9:15 a. m., 0.036 gm. strychnine with 5.4 gm. each of fuller's earth and tartaric acid. It was found dead next morning, no convulsions having been observed.

Dog C 7, weighing 13.5 kg., was given at 9:30 a. m. 0.108 gm. strychnine with 9.1 gm. each of fuller's earth and of tartaric acid. There was slight emesis at 11 a. m. The animal was found dead next morning, no convulsions having been observed.

#### ANTIDOTAL VALUE IN MORPHINE POISONING.

Table 6 shows that the antidotal value of fuller's earth is much greater for morphine than it is for strychnine. This is probably due to the fact, shown in Tables 1 and 2, that morphine is much more readily removed from solutions by fuller's earth than are any of the other alkaloids, as well as to the slight solubility of the alkaloid morphine and the large dose needed to produce death in these animals. It will be noted that the mere addition of fuller's earth saved rabbits from as much as twice the fatal dose of morphine, and that fuller's earth was still capable of saving life, if given ten and fifteen minutes later, but not if given twenty minutes later. The administration, at intervals, of fuller's earth in morphine poisoning in human beings, even after hypodermic administration of the poison or evacuation of the stomach, appears indicated; as the morphine excreted into the stomach would be absorbed by the clay and its reabsorption prevented or at least delayed.

#### ANTIDOTAL VALUE IN COCAINE POISONING.

In view of the local anesthetic quality of cocaine, it is of interest to note that the dog B 1 (Table 7), that received it together with fuller's earth, vomited. Evidently the compound produced by fuller's earth with cocaine is not decomposed in the stomach, which is entirely in accord with the general tendency of the alkaloidal fuller's earth compounds not to give up the alkaloid to an acid solution. This made it necessary again to use hypodermic injections of morphine, one hour previously, to prevent the emesis. However, inasmuch as morphine is an antagonist to cocaine, as will be seen by comparing the result in A 1 and A 2 with A 4 and A 5, it was necessary to use a large fatal dose of cocaine (0.2 gm. per kg.) in order to have a fatal dose in the presence of morphine. The antidotal value of fuller's earth under these circumstances is demonstrated by the uniformly fatal results in experiments A 6, A 7 and A 8, as compared with the

TABLE 7.—Effect on dogs of fatal doses of Cocaine with and without Morphine and fuller's earth.

Dog No.	Weight, Gm.	1 Hour Prev. Hypo. of Morphine, 2 mg. per kg.	Dose		Effects	
			Cocaine, gm.	Fuller's Earth	Symptoms	Result
A 1	7,250	0	0.1 per kg.	0	Convulsions in 25 min.	Death in 90 min.
A 2	3,000	0	0.1 per kg.	0	Convulsions in 15 min.	Death in 20 hrs.
A 3	2,800	0	0.1 per kg.	0	Convulsions in 7 min.	Death in 16 min.
A 4	7,500	0.040	0.1 per kg.	0	Whining occ. ....	Recovery

A 6	6,800	0.035	0.2 per kg.	0	Convulsions in 250 min.	Death in 200 min.
A 7	7,100	0.035	0.2 per kg.	0	Convulsions in 15 min.	Death in 30 min.
A 8	6,500	0.030	0.2 per kg.	0	Depression. ....	Death in 50 hrs.
B 1	6,000	0	0.1 per kg.	60.0	Emesis in 85 min. ....	Recovery.
B 2	12,000	0.600	0.1 per kg.	120.0	0	Recovery.
B 3	6,800	0.025	0.2 per kg.	120.0	0	Recovery.
B 4	6,850	0.025	0.2 per kg.	90.0	0	Recovery.
B 5	3,740	0.020	0.2 per kg.	70.0	0	Recovery.

uniformly negative results in Experiments B 3, B 4 and B 5. Evidently fuller's earth is an antidote to cocaine, and it does not need acid to produce this effect, at least in the presence of morphine, which probably enhances the antidotal effect of fuller's earth by delaying the emptying of the stomach.

#### ANTIDOTAL VALUE IN NICOTINE POISONING.

Rabbits are killed within twenty minutes by 0.20 gm. nicotine per kilogram, as will be seen from Table 8. The addition of fuller's earth to such a dose is followed by recovery. A dose of 0.40 gm. per kilogram is fatal even when fuller's earth and sodium dihydrogen phosphate are added. If the antidote is given five minutes after the poison was administered, it is unable to save life. Evidently nicotine acts too rapidly to admit of any interval between the giving of the poison and of the antidote.

#### ANTIDOTAL VALUE IN IPECAC POISONING.

*Emetic Dose.*—If two dogs of similar size and with empty stomachs are chosen, and one of these is given, by means of the stomach tube, 0.3 cc. per kilogram of fluidextract of ipecac mixed with ten times the volume of water, while the other receives the same dose with the addition of 3 gm. of active fuller's earth per cubic centimeter of fluidextract used, the first dog will vomit profusely and many times—usually not until after half an hour, but within one hour—and soon afterward may have bowel evacuations, which sometimes become bloody. The other dog will show no effects whatever excepting perhaps, occasionally, a looseness of the bowels on the next day.

*Fatal Dose.*—A dose of 1.5 cc. of fluidextract of ipecac per kilogram has been found uniformly fatal in dogs, as will be seen from the following experiments:

Dog A, weighing 15.5 kg. was given 23.25 cc. of fluidextract of ipecac, diluted with 232.5 cc. of water, at 9:42 a. m. Formed bowel movement occurred at 11:25; vomiting at 12, and again at 12:15; semi-liquid bowel movement at 12:30. Several other attacks of emesis occurred during the afternoon, the animal refusing food, but drinking water freely. The next day it was found that the animal had bloody bowel movements; and on this day it died at 10 a. m. Necropsy showed hemorrhagic gastro-enteritis. The urine obtained from the bladder contained albumin and a few red blood corpuscles, but no casts.

Similar results were obtained in three other dogs. A different result was obtained in Dog E. This dog, weighing 7.25 kg. was given 10 cc. of fluidextract of ipecac diluted with 100 cc. of water. Within half an hour, the dog showed marked depression, salivation, and had a fluid defecation, but did not vomit. The animal died within five hours after the administration of the poison, without having had emesis or bloody purging. On post-mortem examination, performed twenty hours later, the gastro-intestinal tract was found pale and without gross evidence of inflammation. Death had evidently occurred too soon for inflammation to have developed.

Entirely different is the result when the total dose of fluidextract of ipecac is mixed with fuller's earth, 3 gm. per cubic centimeter, as may be seen from the protocol of experiment on Dog J. This animal, weighing 9.5 kg., was given 14.25 cc. of fluidextract of ipecac diluted with 142.5 cc. of water, to which 42.75 gm. of fuller's earth were added. There was no effect whatever, excepting that the animal refused food and drink for several hours afterward. During the succeeding days the animal was perfectly normal. Its bowel movements were hard and clay-colored lumps. Its urine was free from albumin. The animal was chloroformed five days afterward. Its gastro-intestinal tract was found

normal. Identical results were obtained in three other dogs. On the other hand, one dog whose stomach was full of food vomited shortly after administration of the dose, probably from over-distention of the stomach. Two other dogs recovered from twice the surely fatal dose of fluidextract of ipecac, namely, 3 cc. of the fluidextract per kilogram, diluted with ten times the amount of water to which a proportionate amount of fuller's earth had been added. Both dogs had a single emesis soon after injection, probably from over-distention of the stomach, for the bulk of the dose is considerable; but developed no further results of any importance and recovered completely, as may be seen from the protocol of one of these experiments:

A dog, weighing a little less than 12 kg., was given 35 cc. of fluidextract of ipecac with 350 cc. of water and 14 gm. of Lloyd's reagent. The dose was administered at 9:50 a. m. Shortly afterward, profuse salivation appeared and lasted for over an hour. Twenty minutes after the injection a single emesis occurred, the vomit consisting of thin watery fluid with a small amount (3 gm.) of the injected preparation. There was no further emesis. A fine muscular tremor appeared at 12 m., and lasted about an hour. Complete recovery took place.

Evidently fuller's earth is a powerful antidote to ipecac. To test its practical value in case of poisoning, the antidote was administered at varying intervals of time after the introduction of the poison with results that might best be shown by tabulation.

It will be noted (Table 9) that, when fuller's earth was given mixed with the poison, no damage occurs.

When the fuller's earth was given ten minutes afterward, the animal was

seriously affected by the poison, but recovered. Fuller's earth was incapable of saving animals when administered twenty minutes or longer after the poison; but it rendered the picture of intoxication milder and postponed death in inverse proportion to the length of time that elapsed between the administration of the poison and of the antidote.

#### ANTIDOTAL VALUE IN ACONITINE POISONING.

Table 10 shows that fuller's earth has some antidotal value in this condition also. It is difficult, however, to arrive at a definite judgment as to the degree of its value. It produces emesis even after the previous administration of morphine. That the emesis does not save life, will be seen from the fact that all the dogs that died vomited. They generally vomited more profusely than the dogs that recovered. Therefore emesis was probably not a factor in those cases in which recovery took place. It will be noted that in practically all the animals that did recover rather marked symptoms occurred: emesis generally the next day, and in several of them bloody defecation, which in one case lasted for several days. The death of the animal D 5 may not have been due to the poison, as the animal was sick before it was subjected to the experiment, as was discovered subsequently. In another series of animals, in which the alkaloid

TABLE 8.—Effect on rabbits of fatal doses of Nicotine given orally with and without fuller's earth and acid.

Rabbit No.	Weight, lbs.	Dose				Effects	
		Nicotine, 100 per cent.	Acetic acid, 10 per cent.	Fuller's earth, 100 per cent.	Acid	Symptoms	Result

D 1	.900	0.70	+	10.0	5.0 NaH <sub>2</sub> PO <sub>4</sub>	0	Recovery
D 2	.680	0.40	+	14.0	0.5 NaH <sub>2</sub> PO <sub>4</sub>	?	Death within 30 hrs.

aconitine (crystalized) was used—not the salt—death occurred in every case, even when fuller's earth or fuller's earth with acid were added, the fatal result being postponed for from twenty-four to forty-eight hours. Evidently the free alkaloid does not combine with fuller's earth as readily as does the salt.

TABLE 9.—Results of administration of fatal dose (1.5 cc. per Kilogram) of Fluidextract Ipecac with and without fuller's earth at varying intervals.

Dog	Administration	Fmels		Defecation	Result	Post Mortem Examination
		Onset, Min.	Time			
A	Ipecac. ....	10	6	Bloody	Death in 24 hours.	Violent gastro-enteritis
E	Ipecac. ....	0	0	Liquid not bloody	Death in 5 hours	Gastro-intestinal tract pale
F	Ipecac and fuller's earth 40 minutes later	...	0	Liquid not bloody	Death within 20 hours	Gastro-enteritis.
G	Ipecac and fuller's earth 30 minutes later	55	6	Bloody....	Death in 25 hours	Gastro-enteritis.
H	Ipecac and fuller's earth 70 minutes later	70	1	Bloody....	Death within 44 hours.	Less severe gastro-enteritis
I	Ipecac and fuller's earth 10 minutes later	22	12	Bloody....	Aborted 5 fetures. Lived for 5 days	Gastro-intestinal tract showed evidence of past catarrhoidile
J	Ipecac and fuller's earth mixed	..	0	Hard, clay-colored	Recovery....	Gastro-intestinal tract normal.

TABLE 10.—Effect on dogs of fatal dose of Aconitine Nitrate, Crystallized, Merck (4 mg. per Kilogram) given orally with and without fuller's earth and acid.

Dog	Weight, Gm.	Morphine Sulph. 5 mg. per 1 Hour Pre. Gm.	Dose			Symptoms	Result
			Aconitine	Fuller's Earth	NaH <sub>2</sub> PO <sub>4</sub>		
A 1	6,350	0.022	0.0054	0	0	Profuse emesis in 5 min. Corp. emesis in 4 hours.	Death in 50 min.
A 2	6,206	0.025	0.0054	0	0		Death in 5 hrs.
B 1	2,606	0.043	0.0244	17.75	0	Femals defec day	Recovery
B 2	1,444	0.055	0.0427	13.0	0	Emesis defec day	Recovery
B 3	4,790	0.025	0.0199	7.50	0	Emesis defec day	Death in 24 hrs.
C 1	9,750	0.048	0.0390	19.50	10.00	Emesis next day	Recovery
C 2	9,270	0.045	0.0387	18.10	10.10	Bloody defec day	Recovery.
D 1	8,000	0.043	0.0344	13.75	13.75	Emesis clear in 2-30 hours	Recovery.
D 4	6,270	0.033	0.0993	13.11	13.11	Bloody defec day	Recovery.
D 5	7,250	0.039	0.0750	14.50	14.50	Emesis defec day	Death in 44 hrs.

TABLE 11.—Effect on dogs of fatal doses of Colchicine (2 mg. per Kilogram) given orally with and without fuller's earth and acid.

Dog	Weight, Gm.	Morphine Sulph. 5 mg. per 1 Hour Pre. Gm.	Dose			Symptoms	Results
			Colchicine	Fuller's Earth	A-1		
A 1	12,000	0	0.02	0	0	Vomiting in 30 hours. Bloody defec in 40 hours	Death within 100 hours
A 2	7,000	0.05	0.02	0	0	Vomiting, and bloody defec next day	Death within 100 hours
D 1	6,000	0.05	0.06	0	0	Bloody defec next day	Death within 100 hours

The results of larger doses might probably best be presented as in Table 12.

It will be noted that fuller's earth alone postponed the appearance of the discoloration, lessened the duration of intense discoloration, but not the duration of slight discoloration. The addition of a small amount of sodium dihydrogen phosphate did not increase very greatly the effect of fuller's earth. The addition of a larger dose that acted on the bowel within an hour and thirty minutes

ANTIDOTAL VALUE IN COLCHICINE POISONING.

The antidotal value of fuller's earth against colchicine poisoning is, no doubt, very slight, even though the number of experiments on this point, as shown by Table 10, may be insufficient. With the comparative indifference, however, of colchicine toward fuller's earth, as shown in Table 2, a different result could hardly be expected.

PERSONAL EXPERIMENTS WITH METHYLENE BLUE AND FULLER'S EARTH.

To put the question to an approximate test whether fuller's earth would be likely to act in human beings as it does in the lower animals, I and one of my colleagues took doses of methylene blue with and without fuller's earth with the following results:

When a dose of 0.010 gm. of methylene blue is taken a dark green color appears in the urine within a short time and disappears within twenty-four hours. If 1.0 gm. of fuller's earth is added to 0.010 gm. of methylene blue in solution, the urine acquires a faint greenish tint for twenty-four hours; the difference between the two specimens of urine being striking.

markedly lessened the period and amount of discoloration. It seems safe to conclude that *fuller's earth*, especially when combined with a laxative dose of sodium dihydrogen phosphate, is capable of greatly lessening in the human the absorption of substances that are readily adsorbed by fuller's earth.

#### CONCLUSIONS.

1. Alkaloidal fuller's earth compounds do not act on the stomach; but are gradually dissociated in the intestine, producing a delayed and milder general action.

2. Fuller's earth has antidotal value in morphine, cocaine, nicotine, and ipecac poisoning. It has less value in strychnine and in aconitine poisoning, though even in these conditions it is capable of saving life, when combined with sodium dihydrogen phosphate. In colchicine poisoning it is of little value.

3. The power of adsorbing alkalis is strongly developed in some fuller's earths and very feebly in others. The adsorptive value of commercial fuller's earths should be

stated by the dealers; and pharmacists should demand specimens of high activity. Lloyd's reagent possesses this power to the highest degree.

4. Fuller's earth is not synonymous with kaolin, as the United States Dispensatory and the National Dispensatory would lead one to infer. It is a substance with markedly different properties.

TABLE 12.—Results of doses of Methylene Blue with and without fuller's earth and Sodium Dihydrogen Phosphate.

Experiment	Dose	Effect
1	0.050 gm. methylene blue	Urine green in 1 hr. 30 min., lasting for 24 days
2	0.050 gm. methylene blue 2.500 gm. fuller's earth	Urine green in 9 hrs., lasting for 24 hrs. Traces of discoloration occasionally for 2 days longer
3	0.050 gm. methylene blue 2.500 gm. fuller's earth 2.900 gm. NaH <sub>2</sub> PO <sub>4</sub> . . .	Urine green in 10 hrs. 30 min., lasting for 17 hrs. Traces of discoloration occasionally for 2 days longer.
4	0.050 gm. methylene blue 2.500 gm. fuller's earth 5.900 gm. NaH <sub>2</sub> PO <sub>4</sub> . . .	Bluish brown liquid defecation in 1 hr. 30 min. Urine light green in 10 hrs. Urine green in 14 hrs., lasting for 7 hrs. Traces of discoloration occasionally for 12 hrs. longer.

#### ORIGIN OF URIC ACID.

The uric acid excreted in the urine is not by any means exclusively derived from alimentary purines; a part of it is formed in the organism. Probably the whole of this endogenous uric acid is not derived from nucleo-albumins, but from other albuminoids. When a subject is submitted to a purine-free diet or one deficient in nitrogen it is difficult to reduce the uric acid below 0.005 gm. per kilo, body weight. Probably a part of this 0.005 gm. comes from the body nucleins or other albuminoids. At any rate, they are of endogenous origin. With purine-free diet given in excess of the requirements for nutriment the amount of urinary uric acid increases. This increase is probably also endogenous. When an excess of purine-containing diet is taken, the increase in uric acid excreted is still greater than can be derived from the food. Here, again, endogenous formation must occur. A part at least of this endogenous uric acid is formed shortly after a meal. More certain knowledge of the physiological role of uric acid excretion would be obtained by the systematic study of the other nitrogenous constituents of urine. In superalimentation with nitrogenous diet the uric nitrogen does not represent a tenth part of the total nitrogen excreted.—*E. Maurel (L'Union pharm., 1914, 55, 337, through Pharmaceutical Journal.)*

### PROGRESSIVE WORK OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

**I**NTERESTED workers in the American Pharmaceutical Association give thought to continued usefulness of the Association. The question of representation in and functions of the House of Delegates is receiving much consideration at the present time. A number of state associations have taken action on this important matter, and expressed their wishes in the resolution submitted by Chairman H. P. Hynson, as follows:

WHEREAS, The correlation of the state associations and their attachment to the A. Ph. A. would greatly enlarge the scope and increase the usefulness of the several state associations and would also increase the strength and influence of the American Pharmaceutical Association; and

WHEREAS, Such correlation and attachment would be in line with the progress of the times and consistent with all forms of effective organization; therefore, be it

*Resolved*, That this Association in convention assembled does hereby endorse the proposition to make the House of Delegates a body composed exclusively of representatives of the state associations; and be it

*Further Resolved*, That the delegates of this Association are hereby instructed to lend all the assistance in their power toward the formation of a House of Delegates composed of state association representatives, only.

If this plan of organization is adopted it will give the state associations complete control of the House of Delegates. Whether or not it might be better to have the Association and the Local Branches represented, also, in the membership of the House of Delegates, is not the question—this will be decided probably at the San Francisco meeting—the big thing is that the plan proposed will correlate the state associations with the A. Ph. A. and provides for an organized body for the discussion and shaping of common interests. Under present conditions each state association acts without any co-operation with the others, though organized for like purposes; the contemplated organization brings the associations together and should greatly promote their usefulness and strengthen their work. The subjects for constructive work are as numerous as those that confront the pharmacist.

The American Pharmaceutical Association early in its history recognized the importance of state organizations, in that respect proceeding along somewhat different lines than in the establishment of our Government, wherein States created the central governing body. The parent organization should welcome the "grown up children" home, to plan for the welfare of the "pharmaceutical family." If pharmaceutical associations are serviceable to pharmacists in their respective states, and they undoubtedly are, then the scope of their usefulness will be enlarged by working together.

The prosperity and wonderful progress of this country is not the result of natural resources, for the Indians possessed these, but the utilization of them. Many, until recently, had the false impression that the United States was independent of other nations; few had reflected that pharmacy would be disturbed by the troubles of Europe. We are dependent, just as one individual lives by the labors of another, so trades and professions influence industry and science, and the thought can be made applicable to associations.

In order to stimulate the efficiency of the numerous national pharmaceutical associations the scope of The National Drug Trade Conference should be enlarged and its relation with the American Pharmaceutical Association strengthened. Many pharmacists affiliate with several organizations in a spirit of helpfulness without realizing their inability to actively participate in all of them and as a result membership, without service or benefit, not infrequently obtains. There are too many organizations for pharmaceutical workers who have similar objects and their concerted efforts would be productive of greater efficiency.

The American Pharmaceutical Association should be made the grand central organization for all pharmacists and as soon as practicable should have a permanent home where a laboratory could be established and research work conducted. This may be too great an undertaking at present, but perhaps means can be devised whereby the facilities of some institution may become available. This thought, however, is simply suggestive.

#### DIVERSIFICATION AND SPECIALIZATION.

THE department store is nothing more than a magnified general store, in the conduct of which system and business methods of a high order obtain.

We are often accused of overdoing things. There is certainly no exception in this connection, for in some of the department stores every demand can be supplied. We are also charged with changeableness; when a method has been overworked we are apt to retract suddenly. The modern drug store is often characterized as a department store, hence this comment. The side-lines in drug stores have been added for increasing the volume of sales and providing more profit; incidentally, we might add that diversification in business was part of the prevailing system.

The time will come when there will again be more specialization, some department stores are now realizing that competent managers for the many departments increase the overhead expense to such an extent that their selling prices on standard goods are not attractive, and the public is beginning to show a preference for "specialty" stores. The smaller stores are becoming more formidable competitors.

Before further comment is made on the drug store, reference to the passing of the book store will illustrate a relevant thought. Every one who was familiar with that institution will admit a preference over the departments, or books as a side-line in stores. Unquestionably the passing of the book store was due to the inclusion of sundry items, which prompted the stocking of books in other

stores as sidelines. May not the variety of stock in drug stores have suggested the inclusion of drugs in department stores?

Bringing the subject nearer to pharmacy, physicians specialized, not only to give better service, but because of greater remuneration therefrom.

The tendency towards side-lines in the drug store is running wild and will be the undoing of the business or result in a division into pharmacies and drug stores. There are many articles other than drugs that have a proper place in the stock carried by the druggist, but when the store presents more the aspect of a toy shop or restaurant than that indicated by the name over the door, it bids one to pause and reflect upon the effect this must have on the patron's views of pharmacy. Modern salesmanship demands a knowledge of goods in stock and the handling of them according to the methods of the specialist in the line. If druggists would carefully estimate their profits in a number of their departments, they would doubtless discard some of them.

There are extremes in diversification and specialization, and a rational medium between extremes is usually productive of the greatest good.

#### ADVERTISING.

A PAGEANT representing the history and science of advertising was one of the features of the program of the annual meeting in Chicago of the Associated Advertising Clubs of America.

The moral conceptions which censor advertising have during the last ten years undergone a steady and radical refinement. The force of self-interest has been largely responsible for more critical circumspection in the acceptance of advertisements by publishers and the advertisers have arrived at the conclusion that "tell the truth" policy brings the best returns.

The principle of self-interest will continue to gather force. The character of circulation has a larger element of value than quality, because it gives tone to the advertisements. The character of circulation is the reflex of the publication's character of which not only the reading pages but the advertisements give evidence. The reputable advertiser deems it obnoxious and a display of poor business judgment to have his message associated with disreputable or dishonest advertising.

The advertising of the retailer should be directed with a co-operative purpose, making his messages "salesmen" for the goods he offers for sale. The value of a sale is secondary to a satisfied customer. Both the business and advertising profit by the square deal.

We may perhaps be permitted to say a few words relative to a form of advertising that needs regulation and may be easily adjusted by wise counseling of advertisers and publishers, namely, the insertion of reading notices. We present this thought with a view of being helpful. Unquestionably most of the present day reading notices are educative and have value for the reader, and usually, they emphasize the advertisement. The adjustment should be on the basis of equity; for certainly when one advertiser is favored and another is not, one has received less value than the other. Newspapers have discontinued these

methods, why not the magazines? If all are treated alike, no one is injured. Modern advertisements are of a character that need no further support than the quality of the goods which backs them; don't scatter the shot, concentrate; the advertisements will have more force.

Successful advertising literature is persuasive, its effectiveness depends upon brief, terse and convincing argument. Honesty is implied, for he is a fool who does not know this is the foundation of success; the higher one hopes to build, the more secure the foundation must be.

#### HARRISON LAW PRESCRIPTION DECISION.

A RECENT decision issued by the Treasury Department (T. D. 2213) relates to prescriptions for narcotic drugs in any quantity not being exempt from the provisions of the Harrison law, unless for preparations or remedies exempted under Section 6 of that law, namely; such as contain not more than two grains of opium, or more than one-fourth of a grain of morphine, or more than one-eighth of a grain of heroin, or more than one grain of codeine in one fluid ounce. These do not require an official order blank for their sale. The decision was rendered June 7th, and reads as follows:

"Attention is directed to the paragraph on page 4 of Treasury Decision 2172 relating to the exemption of certain "preparations" and "remedies" from the provisions of this law. The question arises whether or not "prescriptions" come within the definition of "preparations" or "remedies" as given in the Act. The word "preparations" as generally used and understood, means ready-made or prepared medicines, and the word "remedies" means that which cures or is efficacious in a specific disease or diseases under all conditions, while the term "prescription" is the written direction or recipe of a physician for the compounding or preparing of a medicine and directions for its use to meet the existing conditions in the case of a particular patient.

It is therefore apparent that the exemptions in Section 6 of the Act as interpreted in Treasury Decision 2172, relating to "preparations and remedies" containing not more than the specified quantities of the drugs enumerated, do not apply to "prescriptions" written by registered physicians calling for any quantity of the narcotic drug, unless such "prescription" is written for a "preparation or remedy" prepared in accordance with the U. S. Pharmacopoeia, National Formulary, or other formula, or for a "remedy or preparation" prepared under private or proprietary formula, carried in stock by a dealer, which may be dispensed without a "prescription."

Every "prescription" therefore, containing a narcotic drug in any quantity with the exemptions noted, must have indicated thereon the name and address of the patient, the date, the name and address of the physician, and his registry number. Such "prescriptions" cannot be refilled and must be filed for a period of two years."

Mr. J. W. England, in a paper before the recent meeting of the Pennsylvania Pharmaceutical Association, says, that this decision is open to serious

question, and that the Treasury Department has erred in making this decision, whereby the medical profession is discriminated against in favor of ready-made preparations and remedies, and that an unnecessary burden is thereby imposed upon the physician and pharmacist, without resultant advantage and with the disadvantage that it tends to make the operation of the Harrison Act more complex.

Mr. England recites that under the decision the term "preparation" is limited strictly to "ready-made preparations and remedies," official and unofficial. Continuing, he says, "If the physician orders 'Elixir of Terpin Hydrate with Codeine, N. F.' no order blank is required, but if he orders on a prescription 4 grains of Codeine and 4 fluidounces of Elixir of Terpin Hydrate, which is of exactly the same composition, he has to use an official order blank. If he orders 'Elixir of Terpin Hydrate with Heroin N. F.' no order blank is required, but if he orders on a prescription 1 grain of Heroin and 3 fluidounces of Elixir of Terpin Hydrate—the same thing—the use of an official order blank is demanded. If he orders 'Compound Mixture of Glycyrrhiza,' U. S. P. (Brown Mixture) he is exempted from the use of the official order blank, but not so if he orders a prescription containing the same ingredients and quantities of the preparation.

The word 'preparation' is derived from the Latin word *preparare*, meaning 'to make ready.' It is the act of preparing, making or compounding, especially a medicinal substance fitted for the use of a patient (Webster). It is *not* necessarily a ready-made medicine. It may be made extemporaneously, as with a prescription. Many preparations now official in the U. S. P. and N. F. were originally prescriptions, and many prescriptions now being used by physicians will become official in the U. S. P. and N. F. in the future.

"The fact that a ready-made preparation may be used in a number of diseased conditions and that the physician's prescription is limited to individual use is immaterial, because the prescription ordered for an individual case may be used, also, for a number of diseased conditions, and in fact, as stated before, often becomes a ready-made preparation."

If a little levity is pardoned, law decisions sometimes bring to mind the good old lady who marked her pies "T. M.;" when asked to explain the initials with reference to one kind, she stated that they meant "'tis mince," for others "'taint mince."

Mr. England concludes his argument by saying:

"It may be claimed that the Treasury Department is justified in making such an inconsistent decision on the ground of expediency, because some physicians may be abusing the exempting privilege of Section 6 of the Harrison Act, but the proper remedy would seem to be, not in the issuance of additional and qualifying regulations, but in a more rigorous enforcement of the existing provisions of the Act."

## PROFESSIONAL PHARMACY VS. "COMMERCIAL PHARMACY."

THE judge's charge to the jury in the "Separation Proceedings" presented most interestingly in the June number of the Druggists Circular, recites that divorcement shall not be granted unless the jury is convinced; that the public will be better served by separation of professional from "commercial pharmacy;" that the physician will be better served by this separation; that the pharmacists, both professional and "commercial," will be benefited by it.

Pharmacy cannot be defined without ascribing some relation to medicine; dealing in articles, foreign to pharmacy, is frequently alluded to as "commercial pharmacy." Such erroneous designation should be discontinued. However, accepting of the term "commercial pharmacy" in the judge's charge, as quite generally applied, a jury could readily vote in the affirmative on each of the points and still the sixth argument of "Defendant's Counsel," "that it is impossible to secure the legislation necessary to bring about the proposed divorce," would render the decision of the jury valueless—a clergyman can sell paper dolls, if he desires to do so. The interesting brief should elicit many expressions and arguments of value.

The topic presents one of the most important problems pharmacists must solve and is deserving of careful consideration. The reference to the sixth argument does not imply that legislation cannot *aid* in the establishment of pharmacies and drug stores, but *infers* that a pharmacist may sell articles of merchandise if he is so disposed. If State laws would fix different standards for pharmacists by qualification than for those who do not care to dispense or sell medicines separation would be promoted. The change, however, would be very gradual and largely determined by the inclination of those who hereafter engage in the business. Law did not provide for specialization in the practice of medicine; however, specialization is the order of the day in that profession.

With the addition of numerous side-lines and the greater opportunity for encouraging such business, pharmacy is being neglected in many stores. It would seem that a discussion of the question of separation offers a most interesting topic for association meetings and, by the way, for the House of Delegates. A change will come, whether we direct or not, for the progress of medicine demands higher qualification of pharmacists; on the other hand, the income of stores is increased by sales of merchandise and as a result, proprietors encourage such business. The incompatibility is becoming more pronounced, evidenced by more frequent discussion of the subject.

## THE HOUSE OF DELEGATES, A. PH. A.

## ADDITIONAL INFORMATION.

---

H. P. HYNSON.

---

The Chairman of the "Committee on Investigation" is grateful for a large number of helpful comments on the proposition to make of the House of Delegates a central body for correlating the state pharmaceutical associations, through delegates, and thereby connect the A. Ph. A. directly with all sections of the United States and make it truly representative of the pharmacists of every section of our country; immensely increasing membership and interest in the parent body, as well. It is hoped that the various phases of pharmacy, as represented by the specialized national associations will also be correlated and more closely connected with the A. Ph. A. through the enlargement and extended scope of the Drug Trade Conference.

If some such combinations are not effected under its auspices, the usefulness of the American Pharmaceutical Association will soon pass entirely away through the specialization of effort in the several national associations, as pointedly witnesseth the reading of papers on strictly scientific pharmaceutical subjects at the last meeting of the National Association of Manufacturers of Medicinal Products; the able treatment of commercial problems by the National Wholesale Druggists Association; the elucidation of drug store practice by the National Association of Retail Druggists; the discussion of pharmacy laws by the National Association of Boards of Pharmacy and the control of the teaching of pharmacy by the American Conference of Pharmaceutical Faculties. If the American Pharmaceutical Association does not succeed in correlating and closely attaching to itself the active, energetic state associations, these will, naturally, form sectional unions of great importance.

The conditions surrounding the A. Ph. A. are now very different from those surrounding it when it was formed and when it was the only national body and when there were no state associations and only a few college associations and one local apothecaries' association. Natural and useful pharmaceutical associations, in great profusion, have been formed for every phase of pharmacy and for every geographical section of pharmacy and the one distinct mission left for the A. Ph. A. is to centralize all other important pharmaceutical organizations around itself, without detriment to any and to the greater usefulness and greater strength of all. This is the time with its opportunity, once lost, forever gone.

Dr. James H. Beal, the original promoter and organizer of the House of Delegates, kindly comments as follows:

"I think very favorably of the proposition to restrict the number and character of organizations to be given representation in the House and to declare more specifically what the functions of the House shall comprise.

At the time the resolutions creating the House of Delegates were adopted, I felt that it was a mistake to make its composition as heterogeneous but yielded on this point to avoid endangering the passage of the resolutions, believing that in time the defect would be recognized and corrected.

The great difficulty in making the change is the one which you point out, namely, the possible opposition of some of the institutions and local organizations to being excluded from

the House after having once been admitted thereto. Do you not think it would be possible to at least partially satisfy such objections by inserting in the By-Laws a section providing for the reception of FRATERNAL DELEGATES from bodies not included in the membership, giving to such fraternal delegates the privileges of the floor under more or less restricted conditions?

I believe, also, that the membership should include certain of the general officers of the A. Ph. A. as ex-officio members, and possibly several additional members elected by the Council. Some provision of this sort, it seems to me, is necessary to form a connecting link between the activities of the House and those of the Council.

I do not feel at present that I would insist strongly upon the changes suggested above, but have offered them merely for your consideration.

I trust that your Committee will be able to plan something that will result in converting the House of Delegates into an active and efficient body."

Mr. Joseph W. England, Secretary of the Council, writes:

"I have read with much interest your plea for a change in the character of membership of the House of Delegates, and your plan of procedure, in its essentials, appeals to me very strongly. It is clear, rational, and convincing.

In response to your request to make comments I would like to submit the following, not as the Secretary of the Council, but as member of the Association:

The idea of a House of Delegates originated in the fertile brain of Dr. James H. Beal, enroute with Dr. Henry M. Whelpley, from St. Louis to Denver, in August, 1912, to attend the Denver meeting of the Association.

At this meeting the plan was presented, and freely discussed, and after a number of modifications, the House of Delegates was created, being organized on August 21st, 1912.

It was generally recognized that the plan adopted was in the nature of an experiment, and that changes would have to be made in the near future, and so that these could be readily made, the House of Delegates was created by RESOLUTION of the Association, and not by amendments or additions to the existing by-laws.

Experience has shown that the creation of the House of Delegates was a long step forward, but the initial mistake was made in attempting too much. The membership was made entirely too inclusive. Representation should have been confined to State Associations and the local branches only. As you point out, the delegates of the national bodies,—pharmaceutical, chemical, medical and governmental, should be recognized at the general sessions of the Association and given the privileges of the floor, as heretofore.

As you indicate in your able paper, the 40 or more state associations have the same objects and the same comprehensive character of membership, as has the American Pharmaceutical Association. There is no class distinction. All pharmaceutical interests are represented in the membership. If the States can be induced to 'rally around the flag' of the A. Ph. A., it would be a long, long step forward toward a union of state and national pharmaceutical bodies, with a consequent betterment of all scientific, educational, legislative and commercial interests, as you point out. And that they can be so induced, is shown by the fact that at the Detroit (1914) meeting of the House of Delegates, 36 state associations were represented.

Little argument is needed to show that if active co-operation can be secured between the state pharmaceutical associations and the A. Ph. A., great good must result to both.

Personally, it seems to me that it would be a mistake to confine the proposed representation of the House of Delegates to the state associations only. Why not have the House of Delegates represent, not only state interests, but also local interests AS EXHIBITED IN THE LOCAL BRANCHES OF THE AMERICAN PHARMACEUTICAL ASSOCIATION; the members necessary to form a branch, however, should be reduced from 25 to 15."

Dr. Edward Kremers, of the University of Wisconsin, writes:

"I was surprised to learn how incongruous the house of representatives is. I am heartily in favor of placing the state associations in the closer touch with the A. Ph. A., but I am not convinced that a satisfactory arrangement can be effected until the membership in the state association also implies membership in the national association. However, the subject

is worthy of our careful attention and should receive all consideration possible in the near future."

Dr. F. J. Wulling, of the University of Minnesota and President of the A. C. of Ph. E., writes:

"Before receipt of yours I had regarded the House of Delegates as a factor likely merely to increase the complexity of our manner of doing business. Your suggestions and arguments, however, have much merit in them and, if it can be brought about that this House of Delegates become thoroughly representative of the state associations, I would be very glad to give my approval to a strengthening of the House. I have for a long time favored the closer affiliation of state associations with the A. Ph. A. and I would give my warmest support to any movement that would bind the state associations and the A. Ph. A. into a federation, in which the links would be substantial enough to create a unity of interest that would accomplish the big things for pharmacy as yet unaccomplished. Go ahead."

Dr. J. A. Koch, of the Pittsburgh College of Pharmacy and Chairman of the Executive Committee of the A. C. of Ph. E., writes:

"I have read with much interest your communication referring to the House of Delegates. Fundamentally your object is ideal and I only hope that it can be carried through. I fear though that the greatest difficulty will be to find something for the House of Delegates to do. Unless you can, in some way, tie them to the parent Association by assigning to them some definite work of some importance, I fear it will be difficult to create much interest in the body."

William Mittelbach, member of the Missouri Board of Pharmacy, prominent in all pharmaceutical bodies and loyal to all, communicates the following:

"Your proposal to change membership or representation in House of Delegates of the A. Ph. A. is an improvement. So far, however, I can not see the necessity of such a body at all. A strong committee appointed by the parent body can do all the work that is intended for the House of Delegates and for which it sprang into existence. We have, for years, complained of too many sections, and yet, under the slightest provocation, so to speak, launch still others and more cumbersome ones. Therefore, if we must continue this new branch of the A. Ph. A. let us simplify it by following your suggestion."

Dr. L. E. Sayre, of the University of Kansas, writes:

"As a loyal member of the Association, I am anxious that all of the sections of the Association shall be put in a position of maximum efficiency and would be glad to favor any changes which the mature judgment of your Committee deems advisable.

Now, as I look at it from my point of view, one of the many objects in giving to state associations exclusive control of the House of Delegates would be to help stem the tide of this spirit of iconoclasm.

It would seem to me that we should not ignore the right of full representation of the various branches of the A. Ph. A. now distributed over the United States. These branches should be encouraged just as the American Chemical Society encourages its various branches. I may say incidentally, that I have been trying to start a branch of the A. Ph. A. in Kansas City for a number of years and have made some progress in that direction and am in hopes that in the course of another year I may be able to secure this."

Dr. F. E. Stewart, loyal pharmacist and expert in patent and copyright laws, comments:

"You will remember that Prof. J. C. Lloyd when he was President of the A. Ph. A. advocated a re-organization of the Association for the purpose of limiting its members to retail druggists.

Now, you have gone to the other extreme and are advocating a plan, which, if carried out logically, would place the control of the Association in the hands of the proprietary medicine interests. Am I right about this? . . . I am wondering just what argument you are using in your own mind to justify you in opening the door of the A. Ph. A. to everybody."

F. W. Nitardy, Denver, Ex-Chairman of the Practical Pharmacy and Dispensing Section, A. Ph. A., writes:

"Received your paper in regard to the House of Delegates of the A. Ph. A. and wish to say, I am in hearty accord with your suggestion and hope you and your Committee will succeed in making this proposition a reality."

Prof. Charles H. La Wall, Philadelphia, always helpful, tersely lends his endorsement:

"Your recent communication was received and I heartily endorse the plan proposed therein."

Judge Charles M. Woodruff, Detroit, Michigan, Secretary and Treasurer of the National Drug Trade Conference, writes:

"I am in entire accord with your view that this House of Delegates should be composed only of delegates from state associations who are members of the American Pharmaceutical Association. I must frankly say, however, that I am not in sympathy with your proposition to organize a National Drug Trade Congress, for it seems to me that the present National Drug Trade Conference, which has done such good work already, fills every want; at least so far as legislation is concerned."

Prof. C. B. Jordan, of the Purdue University, lends encouragement:

"I am heartily in accord with your organizing plan of county, state and national associations similar to the American Medical Association and I sincerely hope that you will be successful in the working out of the plan. If I can be of any assistance to you I will be glad to have you call upon me."

From Secretary W. B. Day:

"I am heartily in favor of the suggestion you make that membership in the House of Delegates be limited to representatives of the State Pharmaceutical Associations who are also to be members of the A. Ph. A."

I believe that this would be a great improvement over the present heterogeneous assemblage. Delegates from the National Association might well be accorded recognition at the general sessions of the Association.

I believe that if your suggestion is adopted, it will do much toward bringing the State Associations into closer affiliation with the A. Ph. A., an object which is well worth an earnest effort to accomplish."

#### ATTEMPTS AT EXPLANATIONS.

To Dr. Beal and Mr. England: If more than one, single, class of delegates are admitted into the proposed REFORMED House of Delegates, just then will the principle of equal representation be violated and double representation, in many instances, creep in. "Fraternal Delegates" might, by resolution, be heard, but they should not be admitted to membership nor allowed to vote.

It is to be hoped that "SPECIAL" members, such as officers of the A. Ph. A., will not be provided for. The House of Delegates should not represent the A. Ph. A., but it should be a part of the A. Ph. A., in which the pharmacists, broadly described, of the various states, may be represented and EQUALLY represented. There is actually no need of but one kind of delegate for, most fortunately, every other form of local or national association, but the state associations, has orderly representation, either directly or indirectly, in the A. Ph. A. Let us try the restricted form first. Start right and we will be right.

To Dr. Kremers: It is not believed that we will be able to induce all individual members of the state associations to become members of the A. Ph. A. before the state associations and their members become more closely associated with the A. Ph. A. and more helpfully interested in it. The acquisition of members from the state associations will be large, but the acquisition will be gradually progressive. No very great increase in membership in the

A. Ph. A. would seem to be possible, excepting through the means of some sort of local associations, which will act as feeders to the general body.

To Dr. Wulling: Yours is exactly the conception that promises a reasonably sufficient organization of pan-pharmacy.

To Dr. Koch: There is not the slightest doubt, in the minds of those who have given the subject thorough study, but that right now, interesting and profitable programs for the next five years can be easily mapped out, such programs as will keep a properly formed house of delegates busy one full day or longer each year. Two such programs are submitted herewith.

To Mr. Mittelbach: Unfortunately, your conception of the A. Ph. A., its scope and possibilities, is such as was properly held by its most loyal members fifty years ago. The opposition to attaching the state associations to the A. Ph. A. is the opposition, if it were possible, to the union of the states into our National Government and such as would be against the acceptance of new states. The proposition to create a general reference committee or of making the House of Delegates a body of general reference, is directly against the prevailing tendency toward specialization. The same principle, followed in our general government, would refer to Congress all those particular matters which are now separately taken care of by the special departments or divisional bureaus. This general reference idea is a distinctly backward step and will rob the specialized sections, of the Association and its especially organized committees of their real and truest missions. The House of Delegates should become a *special* reference body for inter-state subjects, only.

To Dr. Sayre: Personal explanations have been made to you, which have no general interest. Your suggestion that the local branches have representation in the House of Delegates is answered in the Chairman's original communication. The local branches have full and unusual representation in the Council. Should they also be represented in the House of Delegates, they would be given undue power and unwarranted importance and the members of these, who are, in nearly every instance, it is believed, also members of their state association, would have double representation in the House of Delegates, which would be, obviously, unfair.

To Dr. F. E. Stewart: The true stamp of humanity is seen upon you when it is discovered that you CAN, sometimes, go wrong. Evidently you have not been nor are now well acquainted with the prevailing conditions, as they relate, especially, to the personnel of the membership of the A. Ph. A. It is much more catholic, as it should be, than you seem to know. You are advised to get acquainted with the members and discover their peculiar lines of action. The door has been wide open, FORTUNATELY, for many years. Pharmacy is a mixture and we must accept it as such, trying, always, to improve the character of the component parts.

To Judge Woodruff, Mr. Nitardy, Prof. La Wall, Prof. Jordan and Prof. Day: You and all who have favored the committee with comments, are heartily thanked for your helpful co-operation. Your continued interest is needed and earnestly solicited. The subject should be patiently discussed at all state association meetings and careful conclusions developed.

#### SUGGESTED PROGRAM FOR THE HOUSE OF DELEGATES 1915 MEETING.

##### MORNING.

*Presidential Address*—Subject: The history of pharmaceutical organization in the United States, with reference to its development consistent with specialization in pharmacy, as well as with the growth and the betterment of the country.

*Address*—The Correlation of 48 State Associations and its Possibilities.

Report of the Committee on Credentials.

Resolutions and Subjects for Discussion, offered by the several delegates, with comments. All to be referred to a special committee for arrangement and presentation.

##### AFTERNOON.

Report of Special Committee appointed "To investigate the House of Delegates and to see if its usefulness could not be improved," with presentation of amendments to the by-laws to be discussed and acted upon at the next session.

*A Symposium*—How far can state laws, applying to pharmacy, be made to conform to similar National laws and would such an agreement make uniform state laws?

- (a) Pure Food and Drugs Laws.
- (b) Anti-Narcotic Laws.
- (c) Poison and "Bichloride" Laws.
- (d) Labeling and Weights and Measures Laws.

Report of committee appointed to arrange and present resolutions and subjects for discussion. Discussion of such as are presented.

EVENING.

Unfinished business, communications.

*A Symposium*—Would the establishment of a system of legalized dispensing service fees, as now prevails in Germany, be helpful to the pharmacists of America? Also, would the practice of making a distinct charge for dispensing services and a distinct cost charge for merchandise tend to give the pharmacist better professional standing?

MORNING.

*Presidential Address*—Subject: Embracing a report of the progress made in correlating the state associations and recommendations for the betterment of prevailing conditions.

*Address*—Why all members of the state associations should also become members of the American Pharmaceutical Association, reciting the benefits to follow this completed membership.

Report of the committee on credentials.

Resolutions and Subjects for Discussion offered by the several delegates, with comments. All to be referred to a special committee for arrangement and presentation.

AFTERNOON.

Report of Committee on Uniform State and National Laws. And a discussion of the forms of laws presented by the Committee.

The existing relationship in the several states between the medical and pharmaceutical professions. Suggestions for the betterment of such conditions.

Report of committee appointed to arrange and present resolutions and subjects for discussion. Discussion of such as are presented.

EVENING.

Unfinished business, communications.

*A Symposium*—The advantages to accrue to retail pharmacists from co-operating with other retail merchants and from taking part in retail merchants associations or bureaus, also reporting of "smart things" done by some of the state associations that might be helpful to others.

Form of resolution that may be discussed at state association meeting:

WHEREAS, The correlation of the state associations and their attachment to the A. Ph. A. would greatly enlarge the scope and increase the usefulness of the several state associations and would also increase the strength and influence of the American Pharmaceutical Association; and

WHEREAS, Such correlating and attachment would be in line with the progress of the times and consistent with all forms of effective organization; therefore, be it

*Resolved*, That this Association in convention assembled does hereby endorse the proposition to make the House of Delegates a body composed exclusively of representatives of the state associations; and be it

*Further Resolved*, That the delegates of this Association are hereby instructed to lend all the assistance in their power toward the formation of a House of Delegates composed of state association representatives, only.

Respectfully submitted,

HENRY P. HYNSON, Chairman.

# A FEW ABSTRACTS OF SUBJECTS PERTAINING TO PRACTICAL PHARMACY OF THE CURRENT YEAR, EVIDENCING THE VALUE OF THE JOURNAL OF THE A. PH. A. TO THE RETAIL DRUGGIST.\*

CHESTER A. DUNCAN, P. D., DALLAS.

The following abstracts have been taken from the Journal of The American Pharmaceutical Association, beginning with the issue of January, 1914:

## THE MAKING OF TABLETS BY THE RETAIL DRUGGIST.

BERNARD FANTUS, M. D.

There are three influences at work destined to change the relation of the retail druggist to the tablet: they are: First, the use of solid fat as a cohesive and lubricant; second, candy medication; third, inexpensive tablet machines.

The value of cacao butter and low-melting point paraffin as cohesives and lubricants are discussed, these agents making it possible for the retail druggist to include tablets along with pills and capsules as extemporaneous products. The increasing demand for sweet tablets and the large number of drugs that can be dispensed in this manner offers a practical opportunity for extemporaneous preparation. Cheap and efficient machines for tablet making are available.

The author's conclusion being that it would pay pharmacists to equip themselves with a tablet machine, discontinue carrying in stock a large number of miscellaneous tablets and that he will be able to prepare sweet tablets as a form of candy medicine that physicians will readily take up as soon as a reliable source of supply has been secured. January, 1914.

## SYRUP OF FERROUS IODIDE.

W. C. ALPERS, SC. D.

As the result of a large number of experiments the presence of a catalyzer, as a coil of bright iron wire, controls the violence of the reaction. Neither invert sugar nor glucose are preferable to granulated sugar. When made from best ingredients does not need a preservative. When dispensed in bottles that will be opened several times a day, the addition of one-half of one percent of citric acid is advisable, provided the quantity will be consumed in thirty days. The slight change in color during the prescribed time is negligible. March, 1914.

## A NEW AND SATISFACTORY FORMULA FOR LIQUOR ANTISEPTICUS.

CHARLES H. LA WALL, PH. M.

The pharmacopœial preparation has been criticized and justly so for being harsh and an unpleasant preparation. A formula is presented which is the result of numerous experiments: Eucalyptol, 5.0 cc., Methyl Salicylate, 1.2 cc., Oil thyme (white) 0.3 cc., Thymol, 1.0 gm., Menthol, 1.0 gm., Sodium salicylate, 1.2 gm., Sodium benzoate, 6.0 gm., Boric acid, 25.0 gm., Fluidextract golden seal, 2.0 gm., Alcohol, 300.0 cc., Water, q. s. to make, 1000.0 cc. Make the solution according to the art of the pharmacist, reserving 60.0 cc. of the alcohol to add to the clear filtrate. Kieselguhr or talc may be used as a filtering medium. April, 1914.

## A NEW AND SATISFACTORY FORMULA FOR LIQUOR ANTISEPTICUS ALKALINUS.

CHARLES H. LA WALL, PH. M.

The N. F. preparation is unnecessarily high in solids and alkalinity. The formula submitted consists of: Sodium bicarbonate, 5.0 gm., Sodium benzoate, 10.0 gm., Sodium sali-

\*Read at recent meeting of Texas Pharmaceutical Association. The object of the paper is evident. The reprinting is for the purpose of suggesting to other members a means for enlisting an interest in those who are not members of the American Pharmaceutical Association.

cylate, 10.0 gm., Sodium borate, 30.0 gm., Thymol, 0.2 gm., Menthol, 0.2 gm., Eucalyptol, 0.2 gm., Methyl salicylate, 0.2 gm., Alcohol, 40.0 cc., Glycerin, 150.0 cc., Water, q. s. to make 1000.0 cc. To color, red cudbear may be used, or a more resistant color which will not bleach out so quickly with hydrogen dioxide solution, the color known as vegetable red, which is sulphonated orcin, may be used. April, 1914.

### LOTIO ALBA.

OTTO RAUBENHEIMER, PH. G.

The author calls attention to the hospital preparation of zinc oxide, solution lead subacetate, glycerin and lime water. This preparation is not intended to be used against acne, pimples, etc., Lotio Alba being composed of zinc sulphate, sulphurated potash of each 5.0 gm. and water or rose water 125.0 cc. The composition of sulphurated potash is discussed, as the value of Lotio Alba depends upon its strength.

Difficulties arising in having this preparation properly prepared suggests the precautions of filtration of separate solutions of zinc and potassa, finely divided precipitate by dilute solutions slowly pouring the potassa solution into the zinc solution with agitation. The pharmacist can prepare small quantities of sulphurated potash and although an unstable chemical is very stable in solution and it is recommended that this be kept as a stock solution for making Lotio Alba. May, 1914.

### THE LINIMENTS OF THE U. S. P. AND N. F.

THOMAS LATHAM.

Comments and suggested formulae.

Linimentum Ammoniae to consist of ammonia water, liquid paraffin oil and oleic acid.

Linimentum Belladonnae, camphor decreased to 37.5 gm. with the addition of Linimentum Saponis.

Linimentum Calcis, the lime water to be of the best and placed in the bottle first.

Linimentum Camphorae, yellow paraffin oil to replace the cotton seed oil.

Linimentum Chloroformi, replaces the present formula with one consisting of chloroform and methyl salicylate in paraffin oil.

Linimentum Saponis, directs that this be made by solution of soap in alcohol and adding other ingredients.

Linimentum Saponis Mollis, methyl salicylate to replace the oil of lavender flowers.

Linimentum Terebinthinae, petrolatum to replace rosin cerate as diluent for oil of turpentine.

Linimentum Aconiti et Chloroformi, N. F., can be improved by adding menthol.

Linimentum Ammonii Iodidi, N. F., present formula replaced by ammonium iodide in soap liniment.

Linimentum Iodi, N. F., considered obsolete.

Linimentum Opii Compositum, N. F., on account of the high price and comparative uselessness of tincture of opium and oil of peppermint the former is reduced from 100 cc. to 10 cc., and the latter replaced by menthol. Tincture of arnica, saponin and linseed oil are added.

Linimentum Saponato-Camphoratum, N. F., soap liniment has taken its place. White laundry soap may be used in making, as it congeals readily.

Linimentum Terebinthinae Aceticum, N. F., the formula slightly modified as to quantities and saponin added.

Formulae are also given for Analgesic Liquid Balm, University Rub, Boston Liniment or Veterinary Liniment. February, 1914.

### A NOTE ON THE VALUE OF PRESERVATIVES IN SYRUP FERROUS IODIDE.

GEORGE M. BERINGER, PH. M.

Tartaric and citric acids in one tenth of one percent solution, serve well as preservatives. If carefully made no preservative is needed. However, to overcome careless manipulation it is deemed advisable to use a preservative. Hypophosphorous acid has the advantage of a reducing value which is not possessed by organic acids. It has the disadvantage that in the strength recommended it will act upon sugar and darken the syrup. This could be overcome

by using glycerin for a portion of the sugar. N. J. Phar. Ass'n., 1914. Jour. A. Ph. A., July, 1914.

#### MAGMA MAGNESIA, N. F.

SAMUEL T. HENSEL, PH. G.

The formula of George M. Beringer is changed in that a larger excess of sodium hydroxide is used to insure complete chemical reaction, the solution of the magnesium sulphate poured into the soda solution as directed in the Beringer formula and in addition the mixed solutions and precipitate are boiled for fifteen minutes. Artesian water used for washing the precipitate instead of distilled water as each gallon of precipitate requires about twenty-five gallons of water for washing. The need for a larger quantity of soda being explained by the peculiarities of mass action. August, 1914.

#### GLYCERITE OF BISMUTH.

WILBUR L. SCOVILLE, PH. G.

A corrected formula and assay process for this product.

The formula is simply a modification of the present one and in order to furnish a product of uniform strength the amount of bismuth is determined before the final quantities of vehicle are added in such proportion that each 100 cc. of product will represent the equivalent of 12.8 gm. of bismuth oxide. The bismuth determination being made by precipitating a measured portion of the glycerite with hydrogen sulphide, washing and weighing the residue. September, 1914.

#### THE PHARMACY OF ADRENALIN.

C. P. BECKWITH.

The chemistry of this sensitive substance is explained, being characterized as an amine base, an alcohol and a phenol. The solubility of the pure substance is given. It forms salts with acids which are usually very hygroscopic and difficult to preserve in dry form. Solution of these in alcohol or water being the usual manner of dispensing. The commercial solution being a solution of 3 to 1000 adrenalin chloride in physiological salt solution with one-half of one percent chlorotone. This retains its activity for a long time if stored away from heat, light and air. Oxidizes on exposure to air as indicated by the change in color from pink to red and then to brown with a brown precipitate. As long as the undiluted commercial solution has not become deeper in shade than pink the loss of activity is practically negligible.

It is advised that adrenalin be dispensed alone and not in mixture. Incompatibilities mentioned are, alkalis and oxidizing agents are chiefly to be feared. In this category are such substances as oxygen, chlorine, bromine, iodine and their oxyacids, permanganates, chromates, nitrates and salts of readily reducible metals. Iron even in traces must be avoided and because of its distribution is extremely troublesome. Nose and throat specialists order spray solutions containing alkalis which if dispensed will render the adrenalin inert. In making dilute solutions sufficient hydrochloric acid should be added in such proportion that the total volume will contain one one-hundredth of one percent acid. November, 1911.

#### A FORMULA FOR A NEW TYPE OF SALINE ANTISEPTIC SOLUTION.

CHARLES H. LA WALL, PH. M.

Recommended as an alkaline and saline solution containing but little alcohol. Consisting of Sodium chloride, 5.0 gm., Sodium borate, 5.0 gm., Sodium bicarbonate, 10.0 gm., Oil of spearmint, 1.0 cc., Oil of eucalyptus, 0.5 cc., Menthol, 0.1 gm., Alcohol, 5.0 cc., Fluidextract of hydrastis (aqueous) 2.0 cc., Water, q. s. to make 1000.0 cc. Dissolve the salts in 750.0 cc. of water and the oil and menthol in the alcohol. Mix the alcoholic solution of oils with 5.0 gm. of magnesium carbonate and triturate gradually with the aqueous solution. Filter and add the fluidextract and finally pass enough water through the filter to make 1000.0 cc. February, 1915.

#### IODINE OINTMENT- DATA AND METHOD OF ASSAY.

LEO. H. TRIF, PH. G., PHAR. D.

A method of assay for this ointment is given together with a report as to observations made concerning the absorption of iodine by the lard. Immediately after making, assay

showed 1.11 percent loss of free iodine. At ten days 1.16 percent and at eight months 1.20 percent. The maximum absorption taking place in ten days. May, 1915.

#### NEW METHOD OF MAKING SYRUPUS HYPOPHOSPHITUM AND SYRUPUS HYPOPHOSPHITUM COMPOSITUS.

F. A. UPSHER SMITH, PH. C.

These new formulæ are proposed with the view that it will be unnecessary for the druggist to carry in stock but one of the hypophosphites, namely calcium hypophosphite, the other hypophosphites are made in the process by reaction of potassium, sodium, iron and manganese sulphates, upon the calcium salt in molecular proportions necessary to form the corresponding hypophosphites, an excess of the calcium salt being used sufficient to represent the correct amount in the finished product. Minn. State Phar. Ass'n, Jour. A. Ph. A., May, 1915.

#### AMPULS.

HERMAN H. NORTH, PH. G.

Evolution of the word, history and forms, glass used and tests, manufacture and cleansing empty ampuls, methods of filling by gravity, pressure, vacuum, testing the sealing, sterilization, solutions decomposed and those not decomposed by heat, are the paragraph headings of a meritorious thesis and worthy of every practical pharmacist's attention.

May, 1915.

---

### CURRENT REVIEW OF PHARMACEUTICAL JOURNALS FOR APRIL, 1915.\*

J. W. ENGLAND.

---

#### THE JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

*Preliminary Note on a New Pharmacodynamic Assay Method*, by Paul S. Pittenger, Phar. D., and Charles E. Vanderkleed, Phar. D. The authors propose the use of *Carassius Auratus* (Gold Fish) as test animals for the digitalis series of drugs, claiming that gold fish are exceedingly sensitive to variations, that the weight of the fish may be disregarded in making the test, that the individual variations in the susceptibility is much less than that of guinea pigs and frogs, and that the gold fish method is the simplest so far proposed and can be easily carried out by those not skilled in pharmacodynamic work. Furthermore, the animals can be procured at all seasons of the year and are inexpensive.

*Examination of Calycanthus Floridus for Alkaloids*, by E. R. Miller and H. W. Brooks. The results obtained make it probable that the plant, which is widely found in the Southeastern States, contains alkaloids.

*The Analysis of Cigarettes, Cigars and Tobacco, and the Use of Lloyd's Reagent in the Determination of Nicotine*, by Azor Thurston. A comprehensive series of analyses of twenty-six brands of cigarettes, both filler and paper.

*Estimation of Calomel*, by R. I. Grantham. Three methods were studied, the third one yielding the highest theoretical results.

*Some Factors in Drug Absorption in Frogs*, by W. F. Baker, M. S., M. D. A paper showing the variation in individuality of frogs with reference to drug absorption. The matter of absorption is largely due to the health of the frogs and the conditions under which they are kept.

*Stillingia Sylvatica*, by E. R. Miller, R. I. Brooks and C. P. Rutledge. A study of the root of *Stillingia Sylvatica*, with especial reference to the presence of the alkaloid *stillingine*.

*Cannabis Sativa*, by H. C. Hamilton, M. S. The author discusses the question, "Is the medicinal value of the drug found only in the Indian grown products?" and he concludes

---

\* Read before Philadelphia Branch, May 11, 1915.

that American Hemp contains the same active ingredients as Indian Hemp, and that, if equal care is used in selecting the proper part of the drug for experiments, no material difference in activity will be found between the extracts of Indian and of American Hemp.

*Estimation of Yellow Phosphorus*, by H. Engelhardt and O. E. Winters. Methods for the determination of Phosphorus in Phosphorus Resin, Phosphorus Paste, Phosphorus Pills and Elixir of Phosphorus.

*Pharmaceutical Education*, by Frank R. Eldred. A study of methods of training for special branches of pharmaceutical work, with special reference to the requirements of modern pharmaceutical manufacturing and drug inspection.

*Pharmaceutical Education, or the Education of the Pharmacist; Which Shall it be?* by Jacob Diner. A study of education as related to pharmacy and the pharmacists, differentiating between the education of the pharmacist and pharmaceutical education.

*Forty-five Years of Manufacturing Pharmacy*, by Frank O. Taylor. A sketch of the history of manufacturing pharmacy of this country, with special reference to the development of Parke, Davis & Co.

*The Study of the History of Pharmacy by Students of Pharmacy at American Institutions of Learning*, by Edward Kremers. An important paper upon the scope of the courses and the methods of instruction of historical pharmacy, with a plea for greater attention by schools of pharmacy to the subject.

*Mineral Waters*, by Julius Greyer. An able and comprehensive paper on this subject.

*Restrictions in the Distribution of Poisons*, by Carl T. Buehler, Ph. G. The author proposes two schedules of poisons, one to be sold on a physician's prescription only, and the other not, but to be recorded in a poison register.

*Should the Retail Druggist Manufacture His Own Preparations, or Buy Them?* by Charles J. Clayton. The author discusses the subject pro and con, believing that there are two sides to the question.

*Some Pharmaceutical Notes*, by William R. White, Ph. C. A series of practical notes on Oleate of Mercury, Spirit of Nitrous Ether and Fowler's Solution.

*Difficult Prescriptions*, by J. Leon Lascoff, Phar. D. A study of seven prescriptions with methods of preparation.

*Red Gum*, by John K. Thum. A valuable, practical paper on this useful astringent.

*Pharmacopœias and Formularies of the World*, by R. H. Needham. An important list of Pharmacopœias and Formularies published both in the United States and abroad.

*Further Facts About Drug Importations*, by Harry B. French, President of the Smith, Kline & French Co. An appeal for an amendment of the Federal Food and Drugs Act to protect the importer of drugs against certain acts perpetrated at the present time by the officials of the Government of the United States at ports of entry, and for the purpose of correcting inequalities of administration of the different ports.

*Professional Pharmacy from the Viewpoint of the Commercial Laboratory*, by Frank E. Stewart, Ph. G., M. D. A plea for co-operative work between the great commercial houses engaged in pharmaceutical and chemical industries and the medical profession, through its universities, laboratories, hospitals and clinics.

*The House of Delegates of the A. Ph. A.*, by Prof. Henry P. Hynson. An exceedingly important communication urging a general discussion of the functions of the House of Delegates of the American Pharmaceutical Association and inviting suggestions regarding its betterment.

*The Percentage of Moisture Lost in the Preparation of Some Official and Unofficial Drugs*, by Edwin L. Newcomb, Ph. D. A valuable compilation of data concerning the moisture lost in the drying of vegetable drugs.

*A Criticism of the United States Pharmacopœial Descriptions of Vegetable Drugs*, by Chalmers Joseph Zuffall.

*The Women's Section and Women Pharmacists*, by Zada M. Cooper. A plea for the growth and development of the Women's Section of the American Pharmaceutical Association and the more extended employment of women in pharmaceutical work.

## AMERICAN JOURNAL OF PHARMACY.

*The Qualitative Separation and Identification of Some Oxymethylantraquinones*, by E. Monroe Bailey. A study of the color principles of Senna, Rhubarb, Aloes and the various species of Buckthorn.

*Standardization of Sodium Thiosulphate Volumetric Solution*, by Joseph L. Mayer.

## AMERICAN DRUGGIST.

*Solving the Coal Tar Derivative Problem*.—An editorial upon a subject which is exercising the deep interest of the American chemical industries of this country.

*Advertising an Ethical Drug Store*, by J. R. Moffett. An interesting chat upon the ethical conduct of the drug business.

*How to Sell Disinfectants Over the Counter*, by John Zeig, M. D. A practical paper on this important subject.

*Pharmacy and Pharmacists*, by John F. Patton. A brief and interesting paper by John F. Patton of York, Pa., a fine type of the old-time pharmacist and a former President of the American Pharmaceutical Association.

## THE DRUGGISTS' CIRCULAR.

*The New British Pharmacopoeia*, by H. H. Rusby, M. D. In this paper Dr. Rusby discusses with characteristic ability the salient features of the new British Pharmacopoeia pertaining to vegetable drugs.

*Skin Foods and Toilet Cream*, by H. C. Bradford. A practical paper on this subject.

## MERCK'S REPORT.

*Perfumery and the Chemist*, by Edward T. Heiser. A study of synthetic perfumes, the author predicting that the time will not be distant when the flower scents will be all synthetic perfumes. "The florist of tomorrow will be the chemist; the garden will be the laboratory; and in crystalline form, among coal-tar stills and complex pots, we shall gather, 'Roses red and Violets blue, and all the sweetest flowers that in the forest grew.'"

## THE JOURNAL OF INDUSTRIAL AND ENGINEERING CHEMISTRY.

*Symposium on the Contributions of the Chemist to American Industries*.—An exceedingly important collection of papers, covering but a few of the industries benefited by the science of chemistry, but they bring into strong relief the growing importance of the services of the industrial chemist and chemical engineer. The papers are too long to abstract, and should be read in the original.

## THE JOURNAL OF BIOLOGICAL CHEMISTRY.

*Human Milk*, by Alfred W. Bosworth. An important study upon the acidity of human milk, the serum of human milk and the principal compounds of human milk.

*The Estimation of Fat*, by Helman Rosenthal and P. F. Trowbridge. A new method for the determination of fat in animals and food stuffs by means of a method of saponification. The method is so accurate that it can be used for the determination of fat in blood, which is not possible with the usual methods.

## THE PERFUMERY AND ESSENTIAL OIL RECORD.

The number includes as usual a full market report. While synthetic chemicals for perfumery are generally very scarce, and command high prices, there is also a notable shortage in several essential oils; otherwise the most interesting feature of the report is the firming up towards the close of the Sicilian essences and the strained conditions between growers and dealers in both American peppermint and French lavender oils.

*The Little Green Devil (Absinthe)*.—A remarkably interesting article upon a weed that for thirty centuries or more has been a type of all that was bitter, that has brought tens of thousands to a maniac's grave, and, incidentally, not a few into sounder health, that has inspired a novel by Miss Marie Corelli and given its name to a London suburb and convict prison. Since the present European war broke out the drinking of absinthe in both the French army and navy has been effectually stamped out, while the Government has supplemented the effort by absolute prohibition of the sale. According to published figures "absinthe ordinaire" contains 47.6 percent of alcohol, "absinthe demi-fine" 50 percent, "absinthe

fine" 68 percent, "absinthe Suisse" 80.6 percent, and in addition to the volatile and bitter constituents of wormwood herb, these liquors contain angelica, anise and marjoram. The bright green tint of the alcoholic extract is intensified by admixture of spinach or parsley, and then toned down to a dull olive green by the addition of burnt sugar, but it is to be feared that the desirable tint of the "little green devil" is frequently obtained by mixtures of indigo and turmeric, and even by acetate or sulphate of copper and green aniline dyes. With national prohibition of absinthe in France has passed away that Parisian function, the "absinthe hour," somewhere between 4 and 6 p. m., and with it the groups of idlers, moodily gazing into the opalescent depths of the seductive poison, diluted with water. The symptoms are quite distinct from ordinary alcoholism. Absinthe appears to act directly through the higher nerve-centers, nervous symptoms being the most prominent throughout. The exhilaration first experienced passes into hallucinations, nocturnal restlessness and terrifying dreams, followed next morning by nausea and vomiting, trembling of the hands and tongue, with dizziness and general unfitness. The final condition of the victim is delirium, epileptiform convulsions and hopeless idiocy. Wormwood herb can scarcely be passed over as an unimportant herb. The yield of essential oil is from 0.2 to 0.97 percent, with a specific gravity of 0.925 to 0.955 and a refractive index of 1.460 to 1.474; the chemical constituents being thujone, thujyl alcohol, acetic, isovaleric and palmitic esters, pinene, phellandrene and cadinene.

*Insects Injurious to Plants*, by E. M. Holmes, F. L. S., F. E. S. A continuation of Curator Holme's very interesting article on this subject from previous issues.

#### THE PHARMACEUTICAL JOURNAL AND PHARMACIST.

*Practical Notes on the British Pharmacopœia*, 1914, by David Gilmore. This is chiefly a report on the standards of the British Pharmacopœia for Laudanum, Spirit of Nitrous Ether and Glycerite of Oleic Acid.

*A New Color Reaction for Salicylic Acid*, by P. A. W. Self, B. Sc., F. I. C. The author uses equal parts by volume of 40 percent formaldehyde and concentrated sulphuric acid, cooling the mixture thoroughly. Next, moisten the substance to be tested, in a porcelain dish, with the above mixture, add a little ammonium vanadate, and stir well. If salicylic acid is present a Prussian blue color—varying in intensity with the amount of salicylic acid—appears immediately, and rapidly changes, first to a greenish blue and finally to green. If, however, no salicylic acid (or other substance capable of yielding a color reaction) is present, the color given by the reagents alone is a yellowish red or orange, which after two or three minutes begins to change to greenish yellow and finally becomes green. With 1 milligramme of salicylic acid the color is intense.

*Notes on the British Pharmacopœia*, 1914, by C. W. Kemsey-Bourne, M. P. S.

*Pharmacopœia Revision*, by William Kirkby, M. Sc., F. C. S., Ph. C. An excellent review of the subject of Pharmacopœias in addition to the present British Pharmacopœia. The author in his researches goes back to the sixteenth century and notes many curious facts in pharmaceutical literature. Between 1618 and 1851, when the last revision of the Pharmacopœia Londinensis appeared, there were nine revisions of it. The years when these were published were 1650, 1677, 1721, 1746, 1748, 1809, 1821, 1836, 1851. But in all there were over thirty reprints and editorials. The amount of original matter in this publication throughout the first century of its existence seems to have been quite meagre. The first issue, and subsequent ones down to 1746, consisted chiefly of matter extracted from the Antidotarium of Nicolaus de Salerno (twelfth century) and the Antidotarium of Johannes Damascenus (John Mesué, ninth century). The apothecaries before the appearance of the official medicine book, depended largely upon Serapion, Dioscorides, Galen, Paracelsus, as well as upon Mesué, Avicenna, and Nicolas. The generally unsatisfactory character of the pharmacopœia and the attitude of the physicians toward unlicensed practitioners led to the appearance of quite a large number of non-official books. Many of these are of considerable interest, because they furnished an extensive reservoir from which the editors of the London Pharmacopœia were able to draw when they decided to put together a discriminatory edition. This was the issue of 1746. The books which appeared during the previous hundred years are worthy of attention. There were commentaries on the Pharmacopœia, such as Salmon's

and Quincy's, formularies such as Radcliffe's, the so-called Pharmacopœia Bateana, Woodall's Surgeon's Mate, Schroeder's Pharmacopœia Medico-Chymica, Culpepper's English Physician Enlarged, and many similar books. Some of these were compendiums of almost everything in physic and surgery. In Woodall's Surgeon's Mate (1639) we even find poetry, of which some may make an appeal to pharmacists of today. At the conclusion of some verses called:

Certaine Chimicall Verses; or Good Will to Young Artists, From the Author, he says:

Common it is with Chymists true  
their house-doves them withstand:  
Fearing all will be spent in smoke,  
time, goods, yea house and land.

A noyse domesticke shrill I hear,  
and I dare stay no longer:  
Good friends adieu till further time,  
I must obey the stronger.

You Chymists wise that wived are,  
be warned here by me,  
Search not into this mysterie  
except your female gree.

For I have found to my great smart,  
when she list to contend,  
Then down goes pot, yea, glass and all,  
and I vow to amend.

And need sayes yeeld. there's fault in him  
that stubbornly stands out  
Till breech and jacket all be torne  
by searching secrets out.

The author concludes his article with an earnest plea that pharmacists be represented upon the Council publishing the British Pharmacopœia.

One method of transportation—the Auto-train.

SUGGESTIONS FOR A COURSE IN MICRO-ANALYSIS AND  
BACTERIOLOGY FOR COLLEGES OF PHARMACY.

ALBERT SCHNEIDER.

At the Detroit meeting of the American Conference of Pharmaceutical Faculties the writer made the following suggestion in the presidential address to the Conference, "That immediate steps be taken to arrange a course in pharmaceutical bacteriology (including sterilization, disinfection and zymology) and sanitation." In harmony with the thought expressed, the following detailed outline of courses is hereby submitted. This outline is based upon the work as carried out at the California College of Pharmacy where these branches of study have been taught for a period of five years to the students taking the regular third-year course. To complete such courses in one year, certain preparation is necessary, as the regular work in the microscopical examination of vegetable drugs and other vegetable substances, and a general course in bacteriology as is given in the regular two-year course in many of the leading colleges of pharmacy. The courses are to be suitably adapted to the correlated courses in chemistry, so arranging the apportionment of the time that twelve hours per week will fall to the work in microscopy and bacteriology and twelve hours to chemistry. The proposed courses, suitably modified and adapted, should also be added to the curriculum of Public Health courses in Medical Colleges and in Universities.

The outline is submitted in the hope that it will receive the attention of all instructors in Colleges of Pharmacy, and Colleges of Medicine and in Universities, who are interested in public health work. Comments and criticisms are solicited.

Part I—Microscopical.—The microscopical examination of fiber foods and drugs.

A laboratory course of four hours each week extending throughout the college year, supplemented by lectures, reviews and special reading and seminar work. The details of the course vary somewhat from year to year. The micro-analytical methods employed in the examination of foods and drugs are similar to those of the U. S. Food and Drugs laboratories, with desirable additions and changes.

## I. Examination of Fiber.

1. Vegetable Fiber.
  - a. Cotton.
  - b. Paste Board. Wrapping Paper. Tissue Paper.
  - c. Newspaper, filter paper, etc.
  - d. Book-paper, Banknote, etc.
  - e. Writing Paper.
  - f. Cordage, thread, etc.
  - g. Cotton cloth. Mercerized Cotton Cloth.
  - h. Hemp Fiber and Cloth.
  - i. Linen Cloth. Linen tester.

2. Animal Fiber.
  - a. Human hair.
  - b. Hair of other animals. Wool. Bristle.
  - c. Woolen cloth.
  - d. Camel's hair. Alpaca. Mohair.
  - e. Silk fiber. Silk cloth.
3. Mixed Fiber. Animal and Vegetable.
  - a. Government Note. Bank Note.
  - b. Felt Paper.
  - c. Shoddy.
  - d. Mixed cloth (wool and cotton).
4. Inorganic Fiber.
  - a. Glass fiber. Glass wool.
  - b. Asbestos.

## II. Commercial Starches.

1. Corn starch, rice starch, wheat starch.
2. Potato starch, sweet potato starch, banana starch.
3. Arrowroot starches, etc.

III. Dextrins. A comparative study is to be made in order to determine the source of the starch used, the degree and character of dextrinization, etc.

IV. Starch Fillers. A study of starch fillers used in sausage meats.

V. Ice Cream Fillers. Starch, Tragacanth, etc.

## VI. Flours and Meals.

1. Cereal Flours. A critical comparative study of wheat, rye, rice and barley grains and the flours made therefrom. Hand gluten test. Bamihl gluten test and Winton modification of the Bamihl test. Processed flour. Bleached flour and chemical test for bleached flour. Polished rice.
2. Oat Meal and Corn Meal. A comparative study. Note the distinct polarizing bands of corn starch.
3. Buckwheat flour. Italian Buckeye meal.
4. Pancake flours. Mixed flours. Making estimates of the percentages of the different flours in the compound or mixture.
5. Banana Flour. Squash meal, etc.

VII. Comparative Study of Brans—wheat, rye, rice, barley, corn. Middlings.

VIII. Cotton Seed Cake. Linseed Cake. A comparative study.

## IX. Prepared Starches, Flours and Meals.

1. Spaghetti, macaroni, noodles.
2. Sago, etc.

X. Bread and Pastry. Examined as to the identity of materials used, as to kind of flour used, etc.

1. Breads, biscuits, rolls, etc. Examination as to starch identification, use of mixed flours, absence or presence of yeast cells, etc.
2. Cookies, cakes, "Arrowroot biscuit," etc.

XI. Breakfast Foods. These are to be examined as to material used, ascertaining manner of manufacture and absence or presence of substances declared on the label.

1. Flaked corn and wheat.
2. Rolled oats and wheat. Mixtures. Manner of manufacture. Chinese puffed rice.
3. Puffed rice and wheat.
4. "Cream of wheat," "Carnation mush," etc.
5. Shredded wheat, "Grape nuts," etc.

XII. Baby and Invalid Foods. These are examined as to presence of flours, unaltered starch, as to identity of starch, use of cane or milk sugar, presence of dried milk, casein, etc.

1. Dried milk and casein. Pure and mixed.
2. Starchy baby foods.
3. Horlick's malted milk.
4. Borden's condensed milk. Evaporated milk.
5. Eskay's food.
6. Peptogenic milk powder, etc.

XIII. Spices and Condiments. These are examined as to identity and quality (organoleptic testing) and as to absence or presence of adulterants. Samples are secured in the open market, from grocers and from pharmacists.

1. Capsicums—Hungarian, American, Mexican, etc.
2. Pepper—Black and white. Processed white pepper (bleached).
3. Allspice and allspice stems.
4. Cloves and clove stems. Exhausted cloves.
5. Nutmeg. Mace. Cinnamon.
6. Mustard. Prepared mustards.
7. Herb Condiments—Marjoram, sage, etc.
8. Umbelliferous spices. Curry powders.

XIV. Dairying Products.

1. Milk. A critical comparative study of normal cow's milk, pasteurized milk, boiled milk, evaporated milk and condensed milk, including bacterial content, presence of pus and blood corpuscles, sediment, etc.
2. Sour milk, klabbered milk, buttermilk.
3. Cream. Whole milk. Half milk. Skimmed milk.
4. Butter and butter substitutes.
5. Cheese and cheese parasites.

XV. Home Drinks.

1. Coffee. The normal and roasted bean. Ground coffee. Coffee substitutes. Dekofa. Cereal coffee. A careful study of round coffees and their more common admixtures and adulterants. A study of coffee substitutes as to composition.
2. Teas. Qualities and grades. Government standards and tests. Tea culture in the United States.
  - a. Coloring substances. Reed test. West test.
  - b. Adulterants. Exhausted tea. Japanese false tea. Foreign leaf, etc.
  - c. Tea substitutes.
3. Cocas and Chocolates.
  - a. Cocos and Chocolates. Methods of manufacture.
  - b. Cocoa shells.
  - c. "Soluble cocos."
  - d. Cocoa butter.
  - e. Adulterants.

XVI. Food Products, Vegetable and Animal. Samples are secured from private homes, grocers and canneries. They are examined as to identity, quality and purity and the findings recorded on special report cards. In the examination of these products the polarizer, the micrometer scale, the Thoma-zeiss hemacytometer (Turck ruling) and other necessary apparatus, are used. The Lagerheim sublimation tests for benzoic acid and salicylic acid and the curcuma thread test for boric acid and the starch paper test for sulphurous acid, are used.

1. Canned meats. Canned fish. Anchovy pastes, etc. Examine for mold and bacterial contamination and the presence of preservatives.
2. Sausage meats. Examine for starches and starch fillers, preservatives and coloring substances.

3. Jams and jellies. Examine as to identity, use of green fruit, fruit refuse, preservatives, yeast, bacteria and mold.
4. Catsups and tomato pastes. Examine for preservatives, mold, bacteria and yeast cells, tomato refuse, etc.
5. Preserved and Pickled Fruits. Examine for bacterial and yeast contamination ("Swells" and "Leaks"), for sulphurous acid (bleached fruits), and preservatives.

XVII. Candies. Qualities and grades. These are to be examined for various fillers (starch, flour), nature of coating, coloring substances, impurities, etc.

1. Stick candies. Nut candies.
2. Coated candies. Chocolate candies.
3. Gum drops, cough drops, caramels.
4. Licorice sticks, etc.

XVIII. Vegetable Drugs, Crude and Powdered. Compound Powders, Pills, Tablets, Extracts. Samples are donated by retail and wholesale druggists or purchased in the open market. These are examined as to quality and purity, ash content (including acid insoluble ash), fineness of powder, organoleptic characters, etc., and the findings entered upon special report sheets.

1. Powdered Vegetable Drugs.
2. Compound Powders. Dusting Powders. Face Powders.
3. Cattle powders.
4. Poultry powders.
5. Extracts, solid and fluid.
6. Medicinal Teas.
7. Pills.
8. Tablets.
9. Crude drugs. Pressed herbs.
10. Patent and proprietary preparations of an organic nature.
11. Calomel, Charcoal, Mercury, Sulphur.
12. Pastes, Plasters, Ointments.
13. Snuffs, Tobaccos.
14. Unknowns.

The sequence of the several operations of the complete analysis of a sample of powdered vegetable drug may be given as follows:

1. Noting the condition of the seals of the sample or package. Breaking the seals.
2. Thoroughly mixing the sample. Selecting an average sample.
3. Organoleptic testing (consistency or feel, color, odor, taste).
4. Determining the fineness by means of a suitable nest of sieves.
5. Preliminary examination of the average sample and of the samples upon the different sieves, using pocket lens, tweezers, etc. Organoleptic testing of individual fragments, etc.
6. Special examination (macroscopical and microscopical) of the several portions on the different sieves if thought desirable or necessary.
7. Again mixing the several portions on the several sieves and reducing to uniform fineness, if thought desirable or necessary.
8. Complete and thorough microscopical examination.
9. Ash determination if thought desirable.
10. Acid insoluble ash determination if thought desirable.
11. Special tests if thought desirable.
12. Recording the results of the analysis.

(To be continued.)

## Obituary

ALBERT PLAUT.

On June 17, 1915, the remarkable life of this brilliant and highly esteemed member of the drug trade was closed by death.

Coming to the United States with his parents in 1868, when eleven years of age, he

macy. Mr. Plaut's natural abilities, however, were such that he assimilated knowledge rapidly and whatever he learned, he learned thoroughly, so that with this preliminary education he was able to conduct his large business interests and his various activities in commercial, educational and philanthropic work with the ease and refinement

ALBERT PLAUT

was prepared for his life's work by what in these days of long courses of study, would be considered a very inadequate education, viz., a three years' course in a New York public school and one year in the college of the city of New York. He also studied for one term at the New York College of Phar-

of one who had enjoyed a complete collegiate education.

In his fifteenth year he entered the drug business with his father, who was conducting a small jobbing drug business in New York City, and remained with him for five years, but when twenty years of age he found the

opportunity of his life by obtaining a position with Lehn & Fink, who had entered the importing and jobbing drug business three years previously, the firm combining the thorough training of the educated German apothecary in the person of Mr. Lehn, with the knowledge of the wholesale merchandising of drugs obtained by Mr. Fink while in the employ of some of New York's jobbing drug houses.

Albert Plaut rapidly assimilated knowledge from his new employers and applied his natural abilities and enthusiasm for work to their service to such good effect that upon Mr. Lehn's retirement in 1886 he became a member of the firm and twelve years later his brother, Joseph Plaut, who had entered the employ of the firm as credit manager in 1886, succeeded Mr. Fink, the remaining original partner.

During these and the succeeding years Albert Plaut's remarkable aptitude as a drug merchant became highly developed; he largely increased his firm's operations in the importation of drugs and chemicals, bringing in not only articles of large demand, but also new and rare grade remedies, so that, while catering to the requirements of manufacturers and large buyers, he steadily increased his firm's distribution to dispensing pharmacists and the best retail drug trade in all parts of the United States to whom Lehn & Fink became known as a source from which practically all articles in the drug and chemical line, however rare, could be obtained; while in Europe the house of Lehn & Fink was considered one of the most progressive drug firms of the United States.

While Mr. Plaut worked arduously in building-up the wholesale drug business which he brought into such prominence, he found time in his busy life to interest himself in many societies for trade-betterment, educational, social and philanthropic purposes. At meetings of these associations, his geniality made him many friends, while his intimate knowledge of business and readiness in debate always secured for him an interested audience.

In the drug trade he was a member of the National Wholesale Druggists' Association, serving it as chairman of many important committees, his services being recognized in 1912 by his being elected to the highest office in the gift of the Association, its presidency,

and he directed the affairs of the Association in this capacity in 1912-1913.

He assisted in forming the Drug Section of the New York Board of Trade and Transportation, in which he always took an active interest; was chairman of the Section in 1903 and a director of the General Board for more than fifteen years.

He was a member of the New York Chamber of Commerce, in which he was the official arbitrator for the drug trade, and was recently elected vice-president of the Merchants' Association of New York.

He became a member of the College of Pharmacy of the City of New York in 1887, served as trustee and chairman of its important Committee on Instruction for nine years; was elected vice-president in 1913, serving as such at the time of his decease.

He was a member of the Committee of Revision of the United States Pharmacopoeia, being elected on account of his intimate knowledge of imported drugs and their sources of supply.

He joined the American Pharmaceutical Association in 1894 and the esteem in which he held it will be best shown by quoting his reply to the greetings of the delegates from the Association to the meeting of the National Wholesale Druggists' Association at Dallas (1910) when he spoke as follows:

"The delegates of the American Pharmaceutical Association are always welcome at the meetings of the National Wholesale Druggists' Association, for many reasons; first and chief among these, I place the matter so thoroughly dwelt upon by the president of the American Pharmaceutical Association, viz.: the fact that they uphold the ethics of the profession at whatever cost. We realize that the American Pharmaceutical Association is responsible, more than any other factor, for the high standing which the pharmaceutical profession enjoys in our country today. As Mr. Eberle has stated, many of the members of our Association are members of that Association, but I take this opportunity to urge those who are not members of the American Pharmaceutical Association to join it, and I urge those of our retail friends who have not as yet seen fit to join that Association to become members of it. Anyone who sees the monthly publication issued by the American Pharmaceutical Association must be impressed, cannot help but be im-

pressed, by the good work, the high quality of the work, that is being performed by the Association. It was never more evident to me than at the recent Decennial Congress at Washington, held for the purpose of revising the Pharmacopœia. The representatives sent there by the American Pharmaceutical Association simply swept everything before them. The men whom they selected to do the work of revision are a body of men whom it is impossible to duplicate or equal among all the professions which are interested in the making of a new Pharmacopœia. I was never so deeply impressed before by the high moral tone, the scientific requirements, the technical knowledge brought out in the discussions at Washington, and the subsequent work of the Committee itself has only served to deepen that impression.

My remarks are really an eulogy of the American Pharmaceutical Association and the high standing which the Association enjoys among similar organizations in other lines. In continental Europe, in Germany, in France, in Austria, in Italy, the American Pharmaceutical Association is known, its prominent members are known, its high standing is recognized, and every American who visits foreign pharmacists and foreign laboratories will be surprised to know that frequently these gentlemen are better known in foreign countries than they are among ourselves, and all I can say, in conclusion, is to repeat my invitation that all those who are entitled to do so should join the American Pharmaceutical Association and get those of our employes and customers who are entitled to join, to do likewise."

Mr. Plaut was one of the founders and Vice-President of the Metropolitan Drug Club of New York, was one of the foremost members of the Chemists' Club and chiefly instrumental in obtaining the funds for the construction of its club house. Was an active member of the American Chemical Society and the Society of Chemical Industry. He was also a member of the Drug and Chemical Club, the City Athletic, Freundschaft, Liederkrantz, Reform, Harmonie, Lotos, and Automobile Clubs, a number of which he served as officer or trustee.

He was also a member of and generous contributor to the Associated Hebrew Charities, and many other charitable and philanthropic organizations.

Mr. Plaut's generous character was shown by his numerous bequests, among which was \$50,000 to employes who had been with him over ten years, \$54,000 to educational institutions, hospitals and charitable societies, and \$15,000 to the College of Pharmacy of the City of New York to endow a scholarship in memory of his father, to be known as the Isaac Plaut Fund.

Mr. Plaut lost his wife fifteen years ago and is survived by a son Edward and two daughters, Mrs. M. J. Falk and Miss Constance Plaut, who, in mourning their great loss, will be consoled by the knowledge that their lamented father died as he had lived, a citizen of no mean city, a man whose unique, forceful personality and splendid business abilities were known and recognized not only by the drug trade, but also by the leading members of the mercantile community, and who crowded into an all too-short life an amount of active work for the service of his fellows that few men are capable of rendering.

#### ALBERT PLAUT.

A TRIBUTE BY W. C. ALPERS, SC. D.

The saying: "De mortuis nil nisi bene" is often put at the head of obituaries of prominent men in order to explain or excuse the then following eulogy. But it is not always necessary to begin notices of this kind with this phrase. In fact, there are cases where this expression becomes a statement of facts, where nothing but good and honorable can be said about the life and works of a departed friend, even if envy or prejudice should look for disapproving words.

Such a man was Albert Plaut. *Our* Albert Plaut, the whole pharmaceutical profession may say. For he was one of the most important, active, influential and honored men of our vocation. Not that he passed through life without enemies or defilers. Far from it. A man of strength, influence and decided character must, of necessity, have enemies. Perhaps it would bespeak less of his strength if he had none. The inscription on a tombstone, "He had no enemies," often appeared to us as a doubtful praise. The weak always fears the strong, the indolent criticises the thinker, the lazy hates the active, the slow envies the successful, the narrow-minded shuns the broad-minded, the miser detests the liberal.

Albert Plaut, too, had such enemies. But far from injuring him, they only added to the high esteem in which the better, the thoughtful, the co-laborers in his many-sided works held him.

But it was not these enemies, it was his friends that mourned at his bier, and he had many of them. Many more than the superficial observer believes. Friends of his successful activity, friends of his sharp and correct judgment, friends of his integrity and honesty, friends of his benevolence, friends of his sincere interest in all matters pharmaceutical, friends of his sacrificing heart.

There are two ways to recognize and judge men of importance. From a distance we may observe them, or in the close intimate circle of friendship. In our ordinary daily life all good men are more or less equal. Each one goes willingly to his work, performs the expected task, earns his bread by the sweat of his brow and goes home contented and hopeful. But when serious times approach, when the weight of events demands stronger shoulders, when the call for talent is heralded through the land, it is then that a giant suddenly towers above the masses. Without wishing or knowing it, the destined one is elected leader, or he breaks through to the front obeying his convictions. More than once when powerful commercial crises threatened did Albert Plaut take the lead. With a sharp look into the future he combined the correctness of quick logical thought. Therefore his advice was sought for and respected. Therefore he occupied the highest and most responsible positions in the societies of his calling. He was a power for action, a force for good. Thus he appeared from a distance, a giant in enterprise, in mind, in influence.

But whoever knew him more intimately, who had the privilege of casting a glance into his heart, would respect him still higher, and the esteem would grow to admiration, to intimate friendship. The world may justly praise Albert Plaut as an active, careful, prudent business man to whom rich compensation flowed as a just recognition of his abilities. But only few know that the acquisition of wealth was not the object of his life. He soared for higher aims. To him money was only the means to do larger and better things. The long list of benevolent societies, more

than thirty in number, to which he left legacies, gives testimony of his benevolent mind and liberal hand. And yet, this is the smallest part of the blessing that he spread among his friends. His sacrificing heart acted without ostentation or flourish of trumpets, and he was always ready to assist the needy or suffering friend. The friend! for he examined carefully the hearts of those that approached him and understood well to distinguish flattery from truth. But whomsoever he had selected as his friend, to him he stuck, defended him against all attacks and helped him willingly and liberally.

For the higher interests of pharmacy Albert Plaut had a warm heart. His participation in the development of the College of Pharmacy of New York is well known and even beyond his death he extended this interest, as the legacy of \$15,000 shows. In the circles of professional pharmacy his merits were equally recognized. When at the meeting of the Convention for the Revision of the Pharmacopoeia in Washington in 1910 the election of a practical business man became desirable, on account of new laws passed by Congress, all eyes turned to Albert Plaut. He was elected a member of the Committee of Revision unanimously by men who had come from all parts of the United States and were convinced of his ability and reliability.

American pharmacy, in all its branches, commercial, scientific, educational and practical, loses in Albert Plaut one of its best and most devoted members and it will be hard to fill his place. As energetic business man, as sterling man of honor, as liberal benefactor, as advocate of higher pharmaceutical education, as dear, sacrificing friend we will remember him forever.

<>

Any business, in order to be a permanent success, must have as a guide the ideals which stand for honesty and integrity of the highest order, which is simply right thinking put into acts. Given a man whose every associate, or every employe, knows that he stands for integrity of the highest order and nothing less, and let the actions of that man speak more loudly than any words which he may say, and there you have a nucleus of a successful business; and let us not forget that while falsehood and insincerity may have a very hard crust, truth will, in time, find a weak spot and finally break through.—The Caxton.

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished reprints by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

- 100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.
- 200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.
- 50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.
- 100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.
- 200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.
- 50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.
- 100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.
- 200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

### PAPERS FOR THE ISSUES OF AUGUST AND SEPTEMBER.

As the papers that were read at the Detroit meeting of the American Pharmaceutical Association have nearly all been printed, the editor requests that contributions for the succeeding numbers of the Journal be submitted. It is not desired to interfere with the work of the Sections and doubtless papers read at the Branch meetings will contribute largely to our present needs.

### WILLIAM MARTIN SEARBY MEMORIAL.

The Alumni Society of the California College of Pharmacy paid a deserved tribute to the memory of William Martin Searby by presenting to the University of California a marble chair bearing the inscription:

"Dedicated to the memory of  
William Martin Searby,  
the Father of  
Pharmaceutical Education  
in the West.

Born 1835. Died 1909."

The ceremonies took place in the Greek Theater of the University at Berkeley, May 16, 1915.

Mr. Searby was elected President of the

Searby Memorial Chair

American Pharmaceutical Association in 1907, presiding at the meeting in Hot Springs (1908). The closing words of his address bear repetition:

"I ask you to turn your faces to the rising sun; feast your eyes on visions of a brighter

day, towards which we are all working as we seek to promote true pharmacy by education, by legislation and by steady, persistent efforts to develop a scientific, practical and ethical pharmacy."

&lt;&gt;

#### TABLET TO THE MEMORY OF DR. DAVID WALDIE.

A bronze portrait medallion tablet has been placed upon the wall of the building occupied by Dr. David Waldie in Linlithgow, England. The sculptor was H. R. Hope-Pinker, Master of the Art Workers' Guild. The tablet bears the following legend:

#### "DAVID WALDIE.

Surgeon, L. R. C. S. E. and Chemist,  
Member of the Asiatic Soc. of Bengal.  
B. Linlithgow, 1813. D. Calcutta, 1889.  
A Pioneer in Anæsthetic Research.

To him belongs the distinction  
Of having been the first to  
Recommend and Make Practicable  
The Use of Chloroform in the  
Alleviation of Human Suffering."

&lt;&gt;

#### SOCIETIES AND COLLEGES.

Whenever reports of annual meetings are sent to the editor by the secretaries of the various Associations a brief account is given in these columns in an effort to present the more important events and transactions. The same may be said regarding reports from schools of pharmacy. Space prohibits going into greater detail, but whenever the list of graduates have been sent in, these have been published.

&lt;&gt;

#### DR. H. H. RUSBY ARRANGES INTER- ESTING TOUR TO SAN FRANCISCO.

A Pacific Coast tour of exceptional interest and value has been organized by Dr. H. H. Rusby. The going route is by way of the

Canadian Rockies and the return via the Grand Canon. Stops will be made at Niagara, Toronto, Lake-in-the-Woods, where two days will be spent in fishing and touring in motor boats among the islands and along the streams, at Banff, Field and Glacier, in the Selkirks, where special attention will be paid to the alpine flowers among the glaciers, and where long stage rides will be taken among the mountains, at Vancouver, Victoria, Seattle and Portland. Six days will be spent in San Francisco, (Association week), one of which will be devoted to the ascent of Mt. Tamalpais and a visit to the big trees, and on one of which Dr. Burbank will conduct the party to his experimental plantations at Hayward. The next stop is at Los Angeles, whence the party goes to the San Diego Fair. Two days later the party returns to Los Angeles and goes to Long Beach, where the evening will be spent on the beach and among the phosphorescent waves. The following two days will be spent on Santa Catalina in fishing, sailing among the marine gardens and in a stage journey to the summit of the mountains. Returning to Los Angeles the party will leave by the Atchison road for the Grand Canon, spending two days at El Tovar Hotel, and then going to Flagstaff. At the latter place, visits will be made to the Lowell Observatory, where the members are promised a look through the great telescope, and to the caves of the ancient cliff dwellers. Two days will be spent at the petrified forests, whence the party will leave for home. From Las Vegas, some will return via Denver, some by St. Louis and some by Chicago. The journey occupies thirty-seven days, about twelve of which will be spent in transit and the rest at first-class hotels. The total cost, including all the side trips and recreations, and with the exception of meals taken a la carte in the dining car, is three hundred and fifty dollars.

The peculiarly interesting features of the trip lie in the fact that Dr. Rusby explored much of the region to be visited, in the interests of the Smithsonian Institution, before the advent of a railroad and while the country was still really primitive. He has pursued routes into the Grand Canon which are quite unknown to the ordinary traveler and is familiar with the forests and flora. While journeying in the Pullman, he will give many familiar talks on subjects of interest in connection with the places through which the car is passing, discussing such topics as

forestry, irrigation, glaciers, alpine floras, the methods and results of Dr. Burbank's work, the big trees, the origin of the Grand Canon, the perification of forests, methods of exploration and of travel under unusual conditions, etc.

#### BULLETIN OF WISCONSIN PHARMACEUTICAL EXPERIMENT STATION.

We have received the Report of the Wisconsin Pharmaceutical Experiment Station. This brief comment is intended to express the satisfaction every pharmacist must have in progressive pharmacy.

The industrial pendulum swings to and fro more rapidly in this country than any other. We recognize opportunities and make use of them speedily, so that often permanent application is impossible because of extreme views. We accept of new discoveries and just as readily discard them. Some insist on the exclusion of nearly all drugs, while others are as emphatic for their retention, in each instance, often with more or less prejudice. Thorough research relative to the production, constitution and action of drugs should decide the question. On this basis the *Materia Medica* should be restricted, for undoubtedly thorough knowledge of a lesser number will enable the practitioner to be of a greater service. As long as there are thousands of remedial agents employed, so long will the practice of medicine slowly advance and we may expect continued refutation of the efficacy of medicine.

There are other things that hinder the progress of pharmacy, but research work in whatever direction should be encouraged, so we are interested in the report; the establishment of this Pharmaceutical Experiment Station should be exemplary to other states.

Scientific cultivation of drug plants has had the attention of the government and pharmaceutical houses and now if all states will recognize that public welfare is concerned in such experimental work we may hope to develop standardized drugs.

Agricultural Experiment Stations are established in every state and this work is so closely related that the admitted utility of the former at once offers an argument for the promotion of this endeavor, which though not directly of the same commercial importance, has a value seldom calculated in money.

Incidentally, it may be said that the report evidences the sincere purpose of thorough,

practical investigation and experimentation, so that results may be utilized industrially. The Bulletin enumerates Wisconsin medicinal plants, contains an interesting article on the cultivation and distillation of wormwood oil in Wisconsin, a chemical study of it by E. R. Miller and one by H. A. Langenhan on the alkaloidal content of stramonium, replete with references.

### The Bulletin Board

#### SAN FRANCISCO MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

(August 9-14, 1915)

##### PROPOSED CHANGE IN THE PROGRAM.

Remember that the Bellevue Hotel, corner Geary and Taylor Streets, San Francisco, is the official headquarters of the A. Ph. A., as announced in the April issue of the *Pacific Pharmacist*. Make your reservations early and avoid delay on arriving. For the benefit of those who may have overlooked the announcement referred to we repeat it in this issue. The following is the tentative program of meetings and sessions. It has been decided that the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties shall hold their sessions on August 5, 6 and 7, of the week before the meeting of the A. Ph. A. The California College of Pharmacy will entertain the members of the Conference and the sessions of this body will be held at the College Building. The Board of Directors of the College are planning a lunch at the Golden Gate Park Casino, a visit to the Park Museum, a visit to the Museum of Anthropology of the University of California with a lecture by Dr. Kroeber of the department of anthropology of the university. The conference will hold one session on the forenoon of Friday, August 6th, and a second session at 7 p. m. of the same day. If necessary, a third session can be held on Saturday, August 7th.

The National Association of Boards of Pharmacy will hold its sessions on Friday and Saturday, August 6 and 7, and the joint session of the boards, the conference and the section of education and legislation will probably be held on Saturday, August 7th. Mem-

bers of the Association of Boards and of the Conference should take notice of the proposed change and make their headquarter reservations accordingly.

#### PROGRAM.

##### (Outline)

For the joint meetings of The National Association of Boards of Pharmacy and The American Conference of Pharmaceutical Faculties to be held Saturday morning, August 7, 1915. (The Saturday preceding the A. Ph. A. convention.)

#### FIRST SESSION.

President T. A. Miller, presiding. W. A. Teeters and H. C. Christensen, secretaries. Report of the joint committee on time and place of meeting. Chairmen of the joint committees, H. C. Christensen and J. A. Koch. Report of the joint committee on questions and examinations, W. S. Flint and Henry Kraemer. Relationship of local boards with local colleges, Philip Asher and Burton Cassaday.

#### SECOND SESSION.

President F. J. Wulling, presiding. H. C. Christensen and W. J. Teeters, secretaries. More perfect and beneficial relationship between the boards and the Faculties, R. H. Walker and C. W. Johnson. Prerequisite laws. Their benefits and objections. H. H. Rusby and John Culley. The relationship of the boards and the faculties to the American Pharmaceutical Association. President Mayo, President Miller and President Wulling.

Business referred to the joint session by the boards or the faculties.

If found necessary or advisable, sessions may be held Saturday night, August 7th, and Monday morning, August 9th.

*Thursday, August 5th.* (Sessions of the National Association of Boards of Pharmacy. The detailed program will be announced later.)

*Friday, August 6th.* 9:30 a. m. First session of the American Conference at the California College of Pharmacy. 12:30. Luncheon at the Golden Gate Park Casino. 2:00 p. m. Visit to the Park Museum. 3:30 p. m. Second session of the Conference. 7:30. Visit to the Museum of Anthropology and lecture. (The National Association of Boards of Pharmacy contemplates holding sessions on this day.)

*Saturday, August 7th.* 9:30 a. m. Joint session of the Boards of Pharmacy, the Con-

ference and the Section on Education and Legislation. 2:30 p. m. The Conference may hold a third session. (The afternoon and evening may be devoted to a visit to the Exposition.)

The following is the tentative program of the sixty-third annual meeting of the American Pharmaceutical Association for the week of August 9-14, 1915.

*Monday*—9:00 a. m. Meeting of the Council. 3:00 p. m. First general session. 7:30 p. m. House of Delegates. 8:30 p. m. Meeting of committee on nominations. Meeting of committee on resolutions. 9:30 p. m. President's reception.

*Tuesday*—9:30 a. m. Second General Session. 2:00 p. m. Scientific Section. Women's Section. Joint Session of Commercial Section and Section on Education and Legislation. 7:30 p. m. Meeting of the Council. House of Delegates. Ladies' Theater Party.

*Wednesday*—9:30 a. m. Section on Education and Legislation. Commercial Section. 12:30 p. m. Luncheon of College Alumni. 2:00 p. m. Scientific Section. Section on Practical Pharmacy and Dispensing (Committee on Pharmacopœias and Formularies). 7:30 p. m. Meeting of Council. Ladies' Reception.

*Thursday*—9:30 a. m. Commercial Section. Scientific Section. Practical Pharmacy and Dispensing (Committee on Pharmacopœias and Formularies). 11:00 a. m. Section on Education and Legislation. 2:00 p. m. Section on Education and Legislation. Historical Pharmacy. Women's Section. 7:30 p. m. Meeting of the Council (Reorganization). 8:00 p. m. House of Delegates. Ladies' Reception. Visit to Chinatown.

*Friday*—9:00 a. m. Meeting of the Council. 10:30 a. m. Final General Session. 1:30 p. m. Luncheon and Adjourned Final General Session at the Inside Inn, Exposition Grounds. 3:30 p. m. Go-as-you-please Exposition Visit. 6:00 p. m. Luncheon at the Inside Inn, Exposition Grounds. 7:30 p. m. Exposition Visit Continued—The Concessions and Illuminations.

*Saturday*—The Local Committee suggests that Saturday be given up to local visits and excursions, arranging the parties to suit. Some may desire to visit Mt. Tamalpais, others the Exposition and still others may desire to go to the Muir Woods, the University in Berkeley, Golden Gate Park.

## WOMEN'S SECTION.

It is urged that every member of the Women's Section attend the meetings of their organization, which now is an official section of the American Pharmaceutical Association. They are also requested to invite others in attendance to join in making the San Francisco meeting a success. There will undoubtedly be quite a few present who never have had the pleasure of acquaintance with those who were active in the organization of this important and interesting section.

## THE STOP IN DENVER.

The Denver branch of the Association reports the following program of entertainment for members en route to San Francisco on the A. Ph. A. special train, which will leave Chicago at 11 p. m., July 29.

Train will be met on arrival in Denver at 7:20 a. m., Saturday, July 31, and members escorted to Albany Hotel, where breakfast will be served and a few addresses made.

Party will then proceed by trolley to Golden, in the foothills of the Rockies; thence by automobile over a new and beautiful road to summit of Lookout Mountain, when a stop of several hours will be made and a box lunch served. Returning the party will reach Denver at 4:30 p. m., in time to do a little sight-seeing or shopping before the special train leaves for Colorado Springs at 7:45 p. m.

Advices from Salt Lake City report that a joint Committee of the Utah Pharmaceutical Association and Salt Lake Retail Druggists' Association has been appointed to arrange for the entertainment of visitors upon the arrival of the A. Ph. A. special train in their city, details of which will be announced later.

## DIASTASE CLUB HEADQUARTERS AT SAN FRANCISCO, CAL.

The Beef-steak Room of the Holbran will be no mistake as the headquarters for the San Francisco meeting of the Diastase. The whole got up from the barn-door to the barrel seats and the shingle-covered piano, are ideally Bohemian and the Peremptory Pre-rogative (Paregoric) will be announced by whosoever will be the presiding genius over this most unique aggregation.

P. S. As past presiding officer (Detroit) while doing the P. P. L. L. as one of the Perjurers I took occasion to visit the trenches with Dr. Alb. Schneider. W. B.

## PARTIAL PROGRAM

For the Joint and Separate Sessions of the Section on Education and Legislation.

Tuesday, Aug. 10th:

2:00 P. M.—Joint Session of the Commercial Section and Section on Education and Legislation.

1. Address of Edward H. Thiesing, Chairman of the Commercial Section.
2. Address of Frank H. Freericks, Chairman of the Section on Education and Legislation.

Reading of Papers.

"Desirable Legislation as an Aid to Maintain Pharmacy"—By Dr. James Hartley Beal.

"How Can the College of Pharmacy Best Help a Student to Secure an Appropriate Commercial Training"—By Dr. Wm. C. Anderson.

"Present method of Prescription Charges. How the joint consideration by Physicians and Pharmacists of a change in the method of prescription pricing can serve to produce a better understanding between them. The possibility of educational advantages. The best interests of the Patient. An aid to the Legitimate Retail Pharmacist"—By P. Henry Utech.

## NOTE.

There will be three papers, one on each of the above subjects, read at the Joint Session under the auspices of the Commercial Section. Chairman Thiesing having about completed his arrangements to that end.

Wednesday, Aug. 11th:

9:30 A. M.—First Separate Session of the Section on Education and Legislation.

1. Report of Secretary R. A. Kuever.
2. Report of the Committee on Patents and Trademarks. Dr. F. E. Stewart, Chairman.
3. Report of the Committee on National Legislation. Mr. John C. Wallace, Chairman.
4. Report of the Committee on Regulations for the Transportation of Drugs by Mail. Mr. Benjamin L. Murray, Chairman.

5. Report of Committee on Survey of the Pharmacal Teaching Institutions—Mr. Hugh Craig, Chairman.

Reading of Papers.

"Quizzes, Tests, or Final Examinations"—By Dr. H. V. Army.

"Is the public welfare properly safeguarded by allowing the compounding and distribution of medicines to be made by those who prescribe them and who have not qualified as Pharmacists."—By Mr. Wilhelm Bodemann.

Report on a tentative draft for a Modern Pharmacy Law. This tentative draft is for consideration and discussion as the work of the Voluntary Conference for Drafting a Modern Pharmacy Law.

If necessary the consideration and discussion will be carried into the next Session.

Nomination of Officers.

Thursday, Aug. 12th:

11:00 A. M.—

1. Further Consideration of the Tentative Draft of a Modern Pharmacy Law.
2. Reading of Papers.

There are a number of interesting papers to be submitted for this Session for which the titles have not yet been definitely stated.

Thursday, Aug. 12th:

2:00 P. M.—Joint Session of the Section on Education and Legislation, Conference of Pharmaceutical Faculties, and National Association of Boards of Pharmacy.

Presidents F. J. Wulling, T. A. Miller, and Chairman Frank H. Freericks, presiding.

1. Report from the Conference of Pharmaceutical Faculties—By Prof. W. A. Teeeters, Secretary.
2. Report from the National Association of Boards of Pharmacy—By Mr. H. C. Christensen, Secretary.

Papers of Joint Interest.

"Co-operation a Necessity. Why should there not be activity between the Medical and Pharmaceutical Professions in this direction?"—By Prof. Joseph P. Remington.

"Qualification Requirement for Teachers in Colleges of Pharmacy"—By Dr. William C. Alpers.

"Pharmaceutical Apprenticeship, Fifty Years Ago"—By Prof. John Uri Lloyd.

## Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or type-written, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

<>

### PHILADELPHIA.

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held on Tuesday evening, May 11, at the Philadelphia College of Pharmacy. President S. C. Henry called the meeting to order at 8:30 p. m.

The minutes of the last meeting were read and approved. Under the head of new business, Dr. F. E. Stewart was nominated and re-elected as a member of the Council of the American Pharmaceutical Association from our Branch.

Mr. J. W. England presented "The Current Review of Pharmaceutical Literature," after which a "Permanent Home for the A. Ph. A." was discussed in an informal manner. The President appointed a committee of three to further investigate the matter.

J. ED. BREWER, Secretary.

<>

### DETROIT.

The May meeting of the Detroit Branch of the American Pharmaceutical Association was held Friday evening, May 21, at the club rooms of the Wayne County Medical Society.

The report of the Treasurer was read and approved.

The Nominating Committee reported the following names for the various offices for the coming year:

For Member of the Council—W. A. Hall.  
For President—W. L. Scoville.  
For Vice-President—O. W. Gorenflo.  
For Treasurer—C. F. Mann.

For Chairman Program Committee—H. B. Mason.

For Secretary—A. A. Wheeler.

The names as presented by the Committee were unanimously elected.

Mr. E. R. Jones then read an interesting paper on Greasy Cold Creams, dealing with the principles involved in making Cold Creams, and making a number of practical suggestions regarding the ingredients, perfumes, packages, etc., of these preparations.

The next paper was on prescriptions by Mr. A. A. Wheeler. Each prescription was written on a blackboard and a specimen of some of the finished products displayed.

A. A. WHEELER, Secretary.

<>

#### SAN FRANCISCO.

The San Francisco branch of the American Pharmaceutical Association held its regular monthly meeting on the evening of June the eighth, in the office of the Pacific Pharmacist. The meeting was called to order by Vice-president Jennie M. White.

The members unanimously approved of the election of Mr. J. H. Dawson as local secretary to succeed Dr. A. Schneider. The tentative program of the sixty-third annual meeting was discussed and seemed to meet with approval.

Mr. J. L. Lengfeld presented a paper on Tooth Powders and Tooth Pastes, in which he mentioned the various ingredients used in their manufacture, such as, chalk, both precipitated and prepared, magnesia, kieselsuhr and kaolin. The importance of using materials of highest quality was emphasized.

The latter part of the evening was taken up with an informal discussion of the latest rulings of the Harrison Narcotic Law. It was said that under treasury decision 2194 such drugs as novocaine, anaesthesin, orthoform and quinine and urea hydrochloride would be brought under the narcotic ruling.

There being no further business the members adjourned to meet again on the evening of July 13th, 8 o'clock, 723 Pacific Building.

CLARISSA M. ROHR, Secretary.

<>

#### NASHVILLE.

The regular meeting of the Nashville Branch A. Ph. A. was held on May 19th. President E. F. Troelinger presiding.

Dr. J. O. Burge presented the subject of How to Get New Members, and his plan of sending out a small folder as an insert was approved.

Dr. J. M. Rogoff stated that his experience as a teacher had convinced him that medical students should have better training in pharmacy and in the use of the United States Pharmacopoeia. On motion, Dr. J. M. Rogoff and Dr. E. A. Ruddiman were appointed a committee to draft a resolution to be presented at the annual meeting in San Francisco advocating better pharmaceutical instruction in medical schools. A question box was decided upon as a feature of future meetings and the services of the students of the pharmacy and medical departments of Vanderbilt were promised in solving difficult problems.

Dr. J. M. Rogoff then read the second of a series of articles outlining a scientific sideline for pharmacists. This paper related to the quantitative examination of the gastric contents and explained how the total acidity, free hydrochloric acid, combined acid, and organic acid can be estimated by means of volumetric alkaline solution.

W. R. White then read a paper entitled, "The Chemistry of the United States Pharmacopoeia."

W. R. WHITE, Secretary.

## Colleges

### UNIVERSITY OF ILLINOIS SCHOOL OF PHARMACY.

The University of Illinois School of Pharmacy has graduated from its longer course the following students with the degree of Pharmaceutical Chemist:

Carroll Edwin Bundy, Sheldon, Ill.

William N. Miller, Waterloo, Ia.

Joseph Pele, Chicago, Ill.

Edward Palmer Scruggs, Livingston, Ala.

<>

### THE COLLEGE OF PHARMACY OF THE STATE UNIVERSITY OF IOWA.

The commencement exercises of above named school were held June 16, Hon. John Barrett, Director General of the Pan American Union, delivered the address. Membership prize in the American Pharmaceutical Association by Dean Teeters, was awarded to F. R. Bergren, subscription to the Journal of the American Pharmaceutical Association, and donated by Professor R. A. Kuever, was awarded to W. A. Konantz; prize of mem-

bership in Iowa Pharmaceutical Association, by Professor Cooper to L. T. Dyke.

The list of graduates follows: E. R. Bergren, Essex; M. H. Anderson, Dike; M. Elsie Campbell, Clinton; Mollie M. Christiansen, Clinton; L. T. Dyke, Orange City; R. L. Fenlon, Iowa City; O. E. Ferguson, Dallas Center; B. B. Hunter, Montezuma; P. K. Huston, Allerton; Mandick Olsen, Forest City; H. W. Pierce, Volga City; R. F. Schneider, Wheatland; J. R. Prieto, Cruces, Cuba; A. B. Wagoner, Pittsville, Mo.; G. J. Zopf, Marengo; R. E. Neidig, Iowa City.

#### JERSEY CITY COLLEGE OF PHARMACY.

The commencement exercises of the department of pharmacy of the College of Jersey City were held at the Bergen Lyceum June 8.

Dr. Gordon K. Dickinson delivered an address, the subject being, Professional Ethics. The degrees were conferred by Dean Dr. Joseph Koppel. President James E. Pope awarded the following prizes: Gold medal to Jacob Feinberg; silver medal to Lorentz Wold; silver cup for the best examination in organic chemistry to Raphael Taub, and the Alumni medal for the best work in pharmacognosy to Louis Schultz. The post-graduate prizes consisted of five memberships in the American Pharmaceutical Association as follows: Reuben Podolsky, Harry Breslaw, Abraham Rosenberg, Jacob Bankoff and Charles Muller. These prizes were awarded by Professor Otto Raubenheimer.

Names of graduates follow:

Senior students receiving the degree of Ph. G. (Graduate in Pharmacy): Herman Berkowitz, Jacob Feinberg, Louis Golden, Morris Goldstein, William Gordon, Lewis M. Horwitz, Jacob Jurow, Edward P. McCarthy, Joseph Novelle, Jacob Rosenbach, Samuel Rosenberg, Irving M. Rosenblum, Louis Schultz, Samuel A. Schwartz, Raphael Taub, Louis Winn, and Lorentz Wold.

Post-graduate students receiving the degree of Phar. D. (Doctor of Pharmacy): Jacob Bankoff, Reuben J. Botkin, Paul G. Bretschneider, Harry Breslaw, Ralph Buonome, Vincent Case, Frank S. DeLeo, Meyer Emanuel, Benjamin Foodim, Leo Genbarg, Alfred B. Guarnier, Henry Herschkowitz, Julius A. Klein, William C. Kraemer, Abraham Lipshitz, Abraham Moldover, Charles Muller, Samuel Neham, Herman H. North, Reuben Podolsky, Sol Pollok, Abraham Rosenberg,

Samuel Schwartzman, Louis Sheinaus, Edward Sher, Isaac Simetz, James A. Sussman, Remo Trotta, Morris Tobias, and Hyman Vogel.

The annual banquet was held June 7. Many interesting but brief addresses were made. Edward Sher, president of the post-graduate class, presented the college with 260 volumes, purchased by the class from the estate of William Saunders. Professor Raubenheimer was presented with a gold watch. About one hundred participated in the banquet.

#### DEPARTMENT OF PHARMACY OF THE MEDICO-CHIRURGICAL COLLEGE OF PHILADELPHIA.

The commencement exercises of the department of pharmacy of the Medico-Chirurgical College of Philadelphia were held at the Academy of Music June 4. The degrees were conferred by President David Milne, and the doctorate oration was delivered by Hon. C. R. Woodruff. The honorary degree of doctor of pharmacy was conferred upon Dr. Francis Edward Stewart, in recognition of high achievements and service. Other degrees were conferred as follows:

##### GRADUATES IN PHARMACY.

Maurice Lewis Augenblick, Harry Franklin Angstadt, Pennsylvania; Jacob Elmer Baker, Maryland; Harrison George Ball, Pennsylvania; Isaac Benjamin Bloomfield, Pennsylvania; Harry Arthur Cohen, Pennsylvania; Earl Montgomery Cole, Pennsylvania; Rudolph Kissel Dorfman, Pennsylvania; Herman Maurice Feuerstein, Pennsylvania; Jean Leon Germann, Albert George Gibboney, Pennsylvania; James Pursley Glover, Pennsylvania; Samuel Sidney Goodman, Pennsylvania; Lewis Sigmund Greenburg, Pennsylvania; Albert Greenlees, Pennsylvania; John Milton Groff, Pennsylvania; Edward Israel Halin, Pennsylvania; Edward Joseph Heine, Pennsylvania; Paul F. Houser, Pennsylvania; Edward Huber, Pennsylvania; Edmund Griffith Jackson, Pennsylvania; Benjamin Ivor Jones, Pennsylvania; Morris Kabacoff, Pennsylvania; Joseph Francis Kennelly, Pennsylvania; Charles Jacob Koerber, Pennsylvania; Levy Meshkov, Pennsylvania; James E. Moss, Pennsylvania; Basil Justin Fontenoy Mott, Pennsylvania; Samuel B. Ostrum, Pennsylvania; Bernard Overbeck, Pennsylvania; Asterios Pappadopoulos, Greece; Thomas Henry Peters, Pennsylvania; Chester John Powell, Pennsylvania; Morgan

Charles Reed, Pennsylvania; Harry Russock, Pennsylvania; Howard Ely Seid, Pennsylvania; Herbert Allaman Smith, Pennsylvania; George Smithgall, Pennsylvania; Martin Yalen Smulyan, Pennsylvania; Alfred Bensinger Stellwagon, Pennsylvania; Michael Stoloﬀ, Pennsylvania; Lester Charles Thrash, Pennsylvania; Aaron Vernick, Pennsylvania; John Robert Williams, Pennsylvania.

#### GRADUATES IN CHEMISTRY.

To receive the degree of pharmaceutic chemist, Ph. C.—Herman Louis Grupe, Ph. G., New York; John Loyd Hess, Ph. G., Pennsylvania; Herman Wischman Mathieu, B. S., Pennsylvania; John Francis O'Brien, Ph. G., New York; Henry Luffberry Somers, Ph. G., Pennsylvania.

To receive the degree of doctor of pharmacy, Phar. D.—Truman J. Wall, Ph. C., Pennsylvania.

#### NEW YORK COLLEGE OF PHARMACY.

A library service bureau will be inaugurated by the New York College of Pharmacy July 1, and conducted under the supervision of Librarian H. V. Arny by Jeanot Hostman and Adelaide Rudolph. The service can be made use of by non-residents as well as local pharmacists. Inquiries of the latter may be taken up in person or by phone; the former will receive their information through the New York Journal of Pharmacy or by mail if a stamped, addressed envelope is enclosed. Problems requiring research will be handled for a moderate fee, also translations will be made into foreign languages.

#### PHILADELPHIA COLLEGE OF PHARMACY.

The ninety-fourth annual commencement exercises of the Philadelphia College of Pharmacy were held June 10th, at the Academy of Music. The announcements were made by Dean Joseph Price Remington, and the degrees were conferred by President Howard B. French. Colonel Henry C. Demming delivered the address.

The following were honored with the degree of Master in Pharmacy: William L. Cliffe, Philadelphia; Caswell A. Mayo, New York; William Mittelbach, Booneville, Mo.; Dr. H. M. Whelpley, St. Louis, and F. G. Eberle, Dallas, Texas.

The list of graduates follows:

Graduates in Pharmacy: Aaron Moses

Abrahamson, Carlos Maria Aguiar, Ahmed Mahmoud El Aguizy, Miss Silvia Clotilde Alacan, Clinton Fisk Avis, Harold Romaine Biddleman, Jay William Bright, Earl Raymond Briner, Bernice Berry Brown, Ph. G.; Miss Estella Elizabeth Brozeitis, Ph. G.; Edward Thomas Burton, Jr., Martin Francis Carmody, Earl Daniel Clark, Paul Close, Charles Mervin Conrow, Miss Catherine Elizabeth Costello, Parker Bare Creep, Ralph Bernard Deaver, Henry Bristol Decker, Lewis Hayden Eaton, Joseph Francis Elward, P. C.; Charles Brewin Everlockner, Miss Fanny Ferry, P. C.; Elmer Delmire Fox, Joseph Fox, Lewis Armstrong Fredericks, Ivan Ralph Fuss, Walter Emanuel Gable, Louis Gershenfeld, Raymond George Gibney, Leonard Edward Greenberg, Ralph Grube, William Frederick Haase, Jr., Charles Raymond Harer, Clarence Augustine Adams Henry, William John Heymann, Earle Milton Hite, James Henry Hodgkins, Miss Eleanor Grace Hoffman, John Henry Hoffman, Arnold Hoffman Huber, Joshua Israel, Charles Edwin Jackson, Elwyn Jones, James Watson Kephart, Frank Martin King, Dixon George Kitzmiller, Jr., Paul Edgar Klucher, William Charles Kohnle, William Sides Kobler, Charles Franklin Moyer, Edward Vincent Myer, Robert Lester Myers, William Edgar Nelson, Charles Adrian Pennock, Charles William Pepper, Earle Charles Phillips, Garland Blair Potterfield, Frank Jerome Reddon, Vaughn Rose Rupert, George Woodward Samsel, Bernard Samuels, Wesley Melvin Saylor, Lewis Cass Scheffey, Miss H. Edith M. Schofield, William Watts Schollenberger, Philip Siegel, P. C.; Harry Lauich Smith, James Samuel Soyles, Chester Arthur Spangler, Stephen Treverton Spargo, Henry Horace Stiles, Robert James Stewart, Harvey E. Stoner, Carroll Burrill Suminsby, William Randolph Tenney, John Thomas, Charles Isaac Tomlin, Samuel Aaron Trethewey, Harry David Wagner, Miss Esther Weinberg, Albert Maurice Weiner, Harry Randolph Whitmire, Joseph Livingston Wilder, David Boyer Witman, Gaile Edgar Wolfe.

Pharmaceutical Chemists—Walter Elmer Asher, Miller Hawk, Herbert Victor Jordan, Niles Amadus Knauss, Robert Allen Levy, Robert Franklin Ligan, Paul Marcus Pfeiffer Merner, Thomas Gilbert Miller, Mark Riggs, Gerald John Ruddy, Walter Raymond Scher, Charles Romey Silva, William Henry Snyder, Harold Edwin Werkheiser.

Certificate of Proficiency in Chemistry—Robert Truman Beardsley, John Brady Evans, Lloyd Philip Greisemer, Thomas Danforth Hughes, Paul S. Rodgers, Joseph Stein, Archibald Wolever.

Certificate in Bacteriology—Norman L. Force, Jacob Edison Good, Gilbert Leon Harvey, John Harry Hayes, Howard Jonathan Koch, Robert Franklin Ligan, Henry Lischer, George Lulie, Martin Lester Messenger, Lloyd Harry Patten, Leroy Ludwig Pennypacker, James Walter Shaffer, Guy Warren Showers, Harry Lanich Smith, Jay A. Smith, Elmer Milton Weidner, Harry Randolph Wiltmire, William Henry Woodring.

#### ANNIVERSARY REUNION.

Forty-five members of the class which graduated from the Philadelphia College of Pharmacy in 1885 met June 9 at the Hotel Adelphia.

The out-of-town members present were: W. B. Bissell, Syracuse, N. Y.; Dr. Charles J. Craythorn, Trenton; Dr. S. B. Crothers, Chester; Edward D. Cahoon, Fouthold, L. I.; O. B. Deakyne, New York; Dr. William D. Deuschle, Columbus, Ohio; P. S. Gehris, Brooklyn; George E. Hurd, Chicago; Dr. James Hunter, Jr., Westville, N. J.; H. E. Heinitsh, Spartansburg, S. C.; Dr. James O. Howells, Bridgeport, Ohio; Dr. Grant E. Kirk, Camden; Benjamin Rosenzweig, Brooklyn; Joseph C. Roberts, Arlington, Md.; Dr. Walter Reynolds, Atlantic City; A. L. Serfass, Easton, Pa., and Henry S. Saunders, Toronto.

The Philadelphia members were: William C. Bichy, Robert C. Cadmus, George L. Carnan, J. A. Eberly, Arthur B. Hammond, Daniel H. Hassler, George A. Haffa, Harry E. Jones, Dr. E. Bryan Kyle, Alex. G. Keller, Dr. J. M. Malatesta, Robert B. Matter, Dr. John D. Moore, W. H. Morrette, J. L. Nedlinger, John W. Newton, A. Curtis Schofield, George M. Smith, Thomas L. Schofield, Dr. S. L. Van Buskirk, and Dr. Alfred C. Wood.

The fifty-first anniversary reunion and dinner of the Philadelphia College of Pharmacy was held at Hotel Walton, with a large attendance. Dean Joseph P. Remington, of the college, was toastmaster. Addresses were made by George W. Samsel, of the graduating class; Caswell A. Mayo, representing the alumni association, and Dr. Alfred Heineberg.

## Societies

### EIGHTH ANNUAL MEETING OF AMERICAN ASSOCIATION OF PHARMACEUTICAL CHEMISTS.

The eighth annual meeting of the American Association of Pharmaceutical Chemists was held in Rochester, N. Y., May 31 to June 5.

President George C. Hall, of New York, reviewed the activities of the year in an able address. Among the important actions taken at the meeting was the establishment of a scientific section to consider and promote the scientific manufacture of pharmaceutical preparations, to define exactness and uniformity in tests and methods of analyses and to have these results recognized by federal and state officials. It is proposed to standardize formulas and eliminate as far as possible those that are useless and unscientific.

The suggestion was also made that so far as practical, narcotics be stricken from pharmaceutical compounds.

A valuable report was presented by the Board of Directors. They indicated their strong approval of the Federal narcotic law and the enactment of effective and uniform state laws modeled after this measure. They also approved the constructive work of the Chamber of Commerce of the United States, providing for uniformity in pure food and drug laws. They recommended the enactment of laws, providing for the proper sanitation and inspection of all places where drugs and medicinal preparations are manufactured, sold, dealt in or handled in any manner.

The Board of Directors presented a resolution by which the Association reaffirms its confidence in and approval of the purposes of the National Drug Trade Conference and continuance of co-operation. R. C. Stofer, W. T. Abbott, and George C. Hall were named delegates and the president was authorized to appoint alternates. Co-operation was offered the American Dairy, Food and Drug officials. They approved proper and effective safeguarding of the sales and manufacture of mercuric chloride tablets, but disapproved of the cylindrical tablet, colored pink and wrapped separately in paper.

B. L. Maltbie as chairman of the committee

on variation clause presented the following resolution:

Resolved, That the American Association of Pharmaceutical Chemists hereby record its earnest disapproval of the elimination of the variation provision of the Food and Drugs Act of June 30, 1906, and in several similar state laws, believing that such an amendment is contrary to public welfare.

Cedar Rapids, Ia., was selected for the next place of meeting. The following officers were elected: President, B. L. Maltbie, Maltbie Chemical Company, Newark, N. J.

First Vice-President, E. S. Holt, Howard-Holt Company, Cedar Rapids, Iowa.

Second Vice-President, J. W. Haynie, Columbus Pharmacal Company, Columbus, Ohio.

Secretary-treasurer, Dr. C. H. Searle, G. D. Searle Company, Chicago, Ill.

The Board of Directors, members elected for one year: H. A. Stiles, Stearns & White Company, Chicago, Ill.; H. C. Moore, Pitman-Moore Company, Indianapolis, Ind.; R. J. Strassenburgh, Rochester, N. Y.

Members elected for two years: R. C. Stofer, the Norwich Pharmacal Company, Norwich, N. Y.; F. L. H. Nason, Tailby-Nason Company, Boston, Mass.; G. C. Pratt, the National Drug Company, Philadelphia, Pa.

Members elected for three years: C. W. Abbot, M. D., the Abbot Alkaloidal Company, Chicago, Ill., chairman; G. C. Hall, the Zenner Company, Pittsburgh, Pa.; G. D. Ellyson, the Standard Chemical Company, Des Moines, Iowa.

#### AMERICAN MEDICAL ASSOCIATION.

We are not in position for this issue to make extended reference to the annual meeting of the American Medical Association in session at San Francisco during the week of June 22. We abstract briefly from the address of President W. L. Rodman, his reference to the elimination of medicine frauds and secondary education leading to the medical profession.

Referring to the efforts which the association had made in the elimination of patent medicine frauds, Dr. Rodman said the fight had involved legal proceedings which the association was combating vigorously, but that it was interesting to note that concerns with new preparations for the market were coming to the association's experts for endorsement. The Council of Pharmacy and Chemistry now had in its laboratories three chemists who give their whole time to testing such

medicine, and the work had culminated in the issue of the book entitled "Useful Drugs," which a number of the best schools now use as a textbook.

"It remains," he said, "for the profession to set its ban on all proprietary medicines, if the only information concerning them comes from those who manufacture and sell them."

A point on which Dr. Rodman laid great stress was secondary education leading to the medical profession. The reforms which the association had fought for in medical schools had been so far brought about that the standard required was now as high as it should be for all of the schools of the entire country.

"An irreducible minimum has been reached," he said, "and it should be honestly enforced—that is, as soon as it can be. There is, of course, no limit to the maximum that any highly endowed and exceptionally circumstanced institution may adopt for itself."

He said that the ranks of the medical schools had been so thinned that a third of the schools were now hors de combat and it was expedient to mark time for a while "and give those institutions which have approached the firing line at a double-quick speed a chance to catch their breath."

But the problem of secondary education for the medical man he thought was handicapped by too high a cultural standard. Although a course in biology, chemistry and physics was agreed upon as a prerequisite to the study of medicine, the subjects were not taught satisfactorily in the high schools and colleges generally.

"Therefore, for the present at least, it must be taught largely by the medical schools, or there must be, as has been suggested by distinguished educators, a rearrangement of the curricula of high schools, so that they will embrace a course in the science which will be acceptable to medical schools.

#### NEBRASKA ASSOCIATION.

The thirty-fourth annual meeting of the Nebraska Association convened in Omaha June 8th to 10th. J. Leyden White, of Washington, addressed the Association, and F. W. Nitardy, of Denver, presented an excellent paper, which is printed in this issue of the Journal.

Chancellor Avery, of the University of Nebraska, delivered a brief address.

One evening of the convention was given over to a lecture by Dr. F. W. Millner, ex-

perimental engineer of the Union Pacific railroad. This was made most interesting by experiments with wireless telegraphy and telephoning from and to trains in motion.

The election of officers resulted as follows: K. L. Kreizinger, President; Vice-presidents in the order named: J. E. O'Brien, Omaha; W. E. Clayton, Grand Island; J. C. Preston, Pierce; G. T. Haines, Omaha; J. C. Hoff, Wisner; O. D. Adams, Treasurer, Nehawka, and J. G. McBride, Secretary, University Place.

Hastings was selected as the next place of meeting.

#### NORTH CAROLINA ASSOCIATION.

The thirty-sixth annual convention of the North Carolina Pharmaceutical Association met at Durham June 15-17. President G. C. Goodman advocated the Stevens bill, commended the Harrison law and outlined the activities of the Association. Thirty-six new members were added. A. L. Fishel was awarded the James H. Beal membership prize, having attained the highest average of the year before the North Carolina Board of Pharmacy.

An interesting program was carried out, enhanced by the following list of valuable papers and speaks for the successful work of Chairman E. L. Tarkenton:

Parcel Post and How I Made a Success of the Drug Business, by C. A. Raysor, Asheville. How Does the Laity Learn the Use of the Newer Synthetic Remedies and the Best Method of Getting the Physician to Prescribe N. F. Preparations, William H. Blauvelt, Asheville. Cultivation of Ginseng and Hydrastis, K. E. Bennett, Bryson City. Kodak and Kodak Supplies and News Stands for Drug Stores, Geo. Y. Watson, Southport. Commercial Pharmacy, C. P. Greyer, Morganton. State Pharmacy Laws, W. W. Horne, Fayetteville. Relation of the Physician and Pharmacist, Burney S. Warren, Greenville. How to Stimulate a Sick Drug Business, E. L. Tarkenton, Wilson. Is the Attendance at Most Pharmaceutical Meetings Due to Lack of Interest or Lack of Time? H. T. Hicks, Raleigh. The Retail Pharmacist and the Traveling Salesman, P. W. Vaughan, Durham. Why Some Pharmacists Don't Make More Money, Sam. E. Welfare, Winston. Deterioration of Pharmaceutical Preparations, Jno. L. Henderson, Chapel Hill. Advantage and Disadvantage of Buying in Large Quantities, C. C. Seawell, High Point.

The Conflict Between Professional and Commercial Pharmacy, J. G. Beard, Chapel Hill. Reciprocity, H. W. Leyden, Burlington. Are We Preparing Satisfactory Clerks? J. E. Shell, Lenoir.

The election of officers resulted as follows: President, E. L. Tarkenton, Wilson; First Vice-President, E. G. Birdsong, Raleigh; Second Vice-President, G. A. Matton, High Point; Third Vice-President, S. E. Welfare, Winston-Salem; Secretary, J. G. Beard, Chapel Hill; Local Secretary, D. A. Elvington, Wilmington; Treasurer, G. E. Burwell, Charlotte; Executive Committee, C. J. O'H. Horne, Greenville; L. L. Haywood, Durham; P. A. Lee, Dunn; Jesse Carter, Aberdeen; J. G. Beard, ex-officio, Chapel Hill; Member of Board of Pharmacy, C. P. Greyer, Morganton.

The next meeting of the Association will be at Wrightsville on the coast, June 20-21-22, 1916.

#### ILLINOIS PHARMACEUTICAL ASSOCIATION.

The Illinois Pharmaceutical Association held a successful meeting at Springfield June 15-17. Professor J. H. Beal delivered an address on "The Standardization of Pharmacy Legislation"; U. S. Senator Lawrence Y. Sherman spoke on "Pharmaceutical and Medical Legislation." Secretary Potts of the N. A. R. D. addressed the convention on the Stevens bill and Harrison law.

President W. F. Bunn in his annual address criticized "cut-rate" druggists and mail order houses handling drugs and spoke of legislation affecting druggists before the present legislature. Before the convention finally adjourned it was announced that the anti-narcotic bill (S. B. 300) had been passed and gone to the governor.

The association will for the next five years meet in Springfield, with the understanding that a pharmaceutical exhibit will be provided and it is also contemplated to canvass the state for new members. Dr. J. H. Beal donated one hundred dollars to the Association, the interest to be used to provide membership in the Association for three young men each year, who make the best average before the Illinois Board of Pharmacy.

The following were awarded prizes for papers: W. S. Denton, subject, "Should the Ownership of Drug Stores be Restricted to Registered Pharmacists"; G. E. Schwitzer, "How to Build Up Business by Courtesy" and "Business Getting" by F. B. Shaffer.

The Auditing Committee reported \$1207.28 in the general fund and \$600 in the permanent fund. Sixty new members were elected. The Association reaffiliated with the National Association of Retail Druggists. The names of T. D. Gregg, C. A. Stover, L. P. Larsen, C. F. Schultz, and H. C. Schuh were recommended to the governor, from which to select one new member of the Board of Pharmacy. E. A. Sell, F. H. Kroh and F. Mares were endorsed for the Advisory Board of the University.

The election of officers resulted as follows: President, Julius Riemenschneider, Chicago; First Vice-President, W. S. Denton, Beardstown; Second Vice-President, Byron Armstrong, Jacksonville; Third Vice-President, Robt. J. Phillips, Springfield; Secretary, W. B. Day, Chicago; Treasurer, Chris. Garver, Bloomington.

The thirty-seventh annual convention will be held at Springfield June 6, 7 and 8, 1916.

#### TEXAS ASSOCIATION.

The thirty-sixth annual meeting of the Texas Pharmaceutical Association was held in Houston June 15th to 17th. While the attendance was not as large as anticipated, the meeting was a very enjoyable one and Houston did its part well as a host. Frank B. Dwyer welcomed the visiting druggists on behalf of the local Association, and Mrs. Clinton Murray in a eulogy praised the men who make the physicians' success possible. The city's welcome was extended by Commissioner H. A. Halverson. Dr. E. F. Cook spoke for the Medical Association, in which he complimented Dr. R. R. D. Cline, who represented the Texas Pharmaceutical Association at the State Medical Association.

President Walter D. Adams in a very comprehensive and valuable address reported the activities of the Association during the term of his office. He recommended that the House of Delegates of the American Pharmaceutical Association be composed of representatives of various state associations, and this recommendation was approved. He also advocated re-affiliation with the National Association of Retail Druggists and in this he also was upheld.

Among the visitors from outside of Texas was Hugh Craig, Editor of the Journal of the National Association of Retail Druggists. He discussed in a very able and brilliant manner the laws that had affected pharmacy

during the past and at the present time. He spoke in favor of the Stevens bill and explained the good results that have resulted from the Harrison law. The Harrison law was also discussed by Deputy Collector Zinnecker. Dr. R. R. D. Cline spoke of the importance of standardizing drugs and preparations. W. H. Cousins, of the Southern Pharmaceutical Journal, spoke of the relation between retail druggists and the jobber.

The get-together spirit and co-operation was the subject of a number of addresses and papers.

R. H. Walker delivered the annual memorial address and paid a beautiful tribute to deceased members. Unfortunately it became his duty to speak of the death of Mrs. I. Lewyn, the wife of one of the Houston members, who died while the Association was in session at Houston.

The activity of the Women's Auxiliary was evidenced in the establishment of a scholarship in the Pharmacy Department of the State University in providing a scholarship for a worthy girl student each year.

The election of officers resulted as follows: A. M. Fischer, of San Antonio, President; C. E. Craycroft, of Sherman, First Vice-president; W. G. Wilman, of Brownsville, Second Vice-president; Mrs. E. B. Dwyer, of Houston, Third Vice-president; Tom J. Snell, of Cooper, Fourth Vice-president; W. H. Cousins, of Dallas, Secretary-treasurer; J. W. Graham, of Austin, Home Secretary; Miss Lum Shipe, of San Marcos, Historian.

Fort Worth was selected as next place of meeting and the time the third Tuesday in May.

#### KENTUCKY ASSOCIATION.

The thirtieth annual meeting of the Kentucky Pharmaceutical Association was held June 15th to 17th at Dawson Springs. It was provided that the state should be thoroughly organized so that legislative measures may be strongly supported. The Stevens bill was re-endorsed and the members urged to support its passage in every way possible. Quite a number of valuable papers were read, and the following officers were elected for the ensuing year: President, W. H. Tibbals, Somerset; Secretary, J. W. Gayle, Frankfort; Treasurer, Vernon Driskell, Carrollton; Chairman Executive Committee, Leon Evans, Mayfield.

Selection of the next meeting place is left to the executive committee.

## IOWA ASSOCIATION.

The Iowa Pharmaceutical Association met at Clear Lake. While the attendance was not as large as anticipated on account of inclement weather, there were upwards of 700 in attendance.

J. Leyden White and Charles Huhn participated in the meeting as representatives of the N. A. R. D. A resolution was passed advocating a constitutional commission of seven members in the N. A. R. D., who should not be elective or appointive office holders in that Association during their time of service on such commission. The development of the organization into one of state units forming the whole, was recommended as one of the points to be considered by the commission. The reorganization of the executive division along lines corresponding to that of the President and Cabinet of the United States.

The officers of the Association elected at the meeting are: J. R. Sutter, Burlington, President; Milo J. John, Clinton, First Vice-President; J. L. Etzel, Clear Lake, Second Vice-President; T. M. Watts, Holstein, Third Vice-President; J. M. Lindly, Winfield, Treasurer; Al. Falkenhainer, Algona, Secretary; A. C. Phillips, Manchester, Executive Committee member for three year term.

## MARYLAND ASSOCIATION.

The thirty-third annual convention of the Maryland Pharmaceutical Association was held at Braddock Heights.

President J. F. Leary, in his address, called the attention to a number of unnecessary laws relating to pharmacy and recommended opposition to every legislative bill hereafter that was not first indorsed by the State Association. Supervision over the dispensaries of physicians was recommended. The Stevens' bill was indorsed. Doctor A. R. L. Dohme spoke on the Harrison law. He asserted that the synthetic substitutes for cocaine were not habit-forming and should not come within the purport of the law. He contended that a distinction should be made between a hypnotic and a narcotic.

A resolution was offered that a pharmacist have place on the State Health Board.

Among the visitors at the convention were representatives from other state associations, Secretary Potts of the N. A. R. D. and Dr. Lyman F. Kebler. Charles H. Knight, J. Fuller Frames, and J. William Dorman, of Bal-

timore, were recommended to the Governor for appointment of one member on the State Board of Pharmacy.

The following officers were elected: President, G. A. Bunting, Baltimore; First Vice-President, Thomas M. Williamson, Frederick; Second Vice-President, Eugene W. Hodgson, Baltimore; Third Vice-President, Charles K. Stottlemeyer, Hancock; Secretary, E. F. Kelly, of the University of Maryland, Baltimore; Treasurer, Samuel Y. Harris, Baltimore.

## PENNSYLVANIA ASSOCIATION.

The Pennsylvania Pharmaceutical Association convened in the thirty-eighth annual convention at Forest Park, June 22d to 24th. A large number of interesting papers were presented, including a very comprehensive report on the drug market.

President E. F. Heffner recommended in his address the appointment of a Publicity Committee for disseminating correct information regarding pharmacy to the general public. Affiliation with N. A. R. D. was continued, and the Stevens' bill endorsed.

The newly elected officers are: President, Theodore Campbell, of Philadelphia; Vice-Presidents, Adolph Schmidt, of McKeesport, and Adam B. Heckerman of Port Royal; Secretary, David J. Reese; Assistant Secretary, Lewis H. Davis; Treasurer, Francis H. E. Glein; Member of Executive Committee for three years, Crowell Keller, of Harrisburg.

The next meeting will be held at Reading, Pa., June 20th, 1916.

**The Pharmacist and the Law**

The health department of the city of New York has appointed inspectors to visit all large manufacturers and distributors of "patent" remedies, having in view the purpose of driving all such remedies as make false representations from the market, and also in order to induce the manufacturers to file their qualitative formulas for their medicines with the health department, although the local health board's formula disclosure ordinance does not become effective until December 31, 1915. To date none of the

manufacturers of proprietary medicines has complied with this ordinance.

Several manufacturers have been brought into court and it is stated that the cases will be defended.

<>

#### PENNSYLVANIA RECIPROCAL RECOGNITION OF PHARMACY GRADUATES BILL APPROVED.

Governor Brumbaugh, of Pennsylvania, has approved an amendment to Section 5 of the general pharmacy act of May 21, 1887, by providing that pharmacists' certificates shall be issued (after proper examination, etc.) only to graduates of colleges of pharmacy "of this (Pennsylvania) or some other state or any foreign country whose pharmacy licensing board or other authority recognizes the graduates of the reputable and properly chartered colleges of pharmacy of Pennsylvania, and admits the graduates of all such colleges to its pharmacy licensure examinations."

<>

#### HARRISON LAW RULINGS.

Article I, second paragraph of the Harrison law has been amended as follows, and relates to registration by owners of more than one store, etc.

"If the applicant has more than one place of business, or if, in any case, the applicant is engaged in more than one profession or business where any of the drugs above described (in the law) are made, stored or dispensed, a separate application for registry must be made and a special tax must be paid in each such case."

A decision (T. D. 2211) provides that in order to legally register a party must be a legitimate producer, importer, manufacturer, seller, or distributor of the aforesaid drugs, and likewise a physician, dentist or veterinary surgeon can register under this act and dispense these drugs "in the course of his professional practice only." It also follows from the express language of the act that such physician, dentist or veterinary surgeon can prescribe such drugs when he "has been employed to prescribe for the particular patient receiving such drugs," and upon whom he "shall personally attend in the course of his professional practice only," and such prescriptions must be made "in the legitimate practice of his profession," and then only when "employed to prescribe for the particular person receiving such drugs."

This ruling will largely exclude the supplying of drugs on mail orders.

Another ruling provides that collectors of internal revenue will require persons making applications to state, under oath, in the blank space on Form 678, or if not sufficient space on the line for that purpose it should be in the form of an affidavit attached to the application or this form, that they will engage in administering, dispensing or prescribing narcotic drugs only in the legitimate practice of medicine, dentistry or veterinary surgery; or will engage in the business of producing, importing, manufacturing, compounding, dealing in, dispensing, selling or distributing, as the case may be, only those narcotic drugs for which they are duly qualified by law, e. g., "The undersigned is now engaged or on and after \_\_\_\_\_ will engage in the legitimate practice of medicine (dentistry or veterinary surgery), and is, or are, duly authorized by law to administer, dispense or prescribe narcotic drugs," or "The undersigned is now engaged or on and after \_\_\_\_\_ will engage in the lawful business of producing (importing, manufacturing, compounding, dealing in, dispensing, selling or distributing) narcotic drugs."

### Council Business

#### COUNCIL LETTER No. 24.

Philadelphia, Pa., May 26, 1915.

To the Members of the Council:

*Motions Nos. 37 (Award of Contract for Reporting 1915 Annual Meeting) and 38 (Election of Members; Applications Nos. 114 to 131, inclusive),* have each received a majority of affirmative votes.

*Motion No. 39 (Appropriation of \$50 for A. Ph. A. Buttons and Pins).* Moved by H. M. Whelpley, seconded by J. W. England, that an appropriation of fifty dollars be made for the purchase of official A. Ph. A. Buttons and Pins. The appropriation is approved by the Committee on Finance.

*Motion No. 40 (Election of Members).* You are requested to vote on the following applications for membership:

No. 132. Joseph Winfred Raycraft, 702 Jackson St., Springfield, Ill., rec. by Clyde M. Snow and W. B. Day. (Pharmacy Prize, University of Illinois, School of Pharmacy.)

No. 133. Samuel Leon Baker, 1554 W. 12th St., Chicago, Ill., rec. by W. B. Day and

Clyde M. Snow. (Materia Medica Prize, University of Illinois, School of Pharmacy.)

No. 134. Frank Eugene Lane, Jr., 4015 Blair Ave., St. Louis, Mo., rec. by Glenn A. Burkart and H. M. Whelpley.

No. 135. David J. Reese, 17th and Huntingdon Sts., Philadelphia, Pa., rec. by Charles H. LaWall and M. R. LaWall.

No. 136. Omer St. Amour, Box 1819, Ste. Agathe Des Monts, Quebec, rec. by Alex. J. B. Moore and Wm. B. Day.

No. 137. William G. Heddesheimer, 2482 8th Ave., New York, N. Y., rec. by Joseph Maisel and J. Leon Lascoff.

No. 138. Gustave H. Meyer, 2433 7th Ave., New York, N. Y., rec. by Joseph Maisel and J. Leon Lascoff.

No. 139. Jacob Marianowsky, 310 S. 4th St., Brooklyn, N. Y., rec. by J. Leon Lascoff and Gustave Horstmann.

No. 140. Oscar M. Godlust, 1566 3d Ave., New York, N. Y., rec. by J. Leon Lascoff and Thomas Latham.

No. 141. P. Gerhard Albrecht, Cleveland School of Pharmacy, Cleveland, O., rec. by Wm. C. Alpers and J. L. Stingel.

No. 142. George Gehring Marshall, Marshall Bldg., Cleveland, Ohio, rec. by Wm. C. Alpers and J. L. Stingel.

No. 143. Wm. P. Stevenson, 210 Spruce Ave., Rochester, N. Y., rec. by Eugene L. Maines and Howard W. Gardner.

No. 144. Hilton F. Snider, 195 Exchange St., Rochester, N. Y., rec. by Eugene L. Maines and Howard W. Gardner.

No. 145. John Harold Strassenburgh, 195 Exchange St., Rochester, N. Y., rec. by Eugene L. Maines and Howard W. Gardner.

No. 146. J. Larkin Fields, 110 E. Douglas St., Wichita, Kans., rec. by J. S. Chism and Wm. B. Day.

No. 147. George E. Canham, 6144 Kenwood Ave., Chicago, Ill., rec. by Wm. B. Day and Clyde M. Snow.

No. 148. Mike Robert Bianco, Du Quoin, Ill., rec. by Wm. B. Day and Clyde M. Snow. (Chemistry Prize, University of Illinois, School of Pharmacy.)

No. 149. Harry Deathe, 300 Link St., Palestine, Texas, rec. by J. Morgan Fletcher and E. G. Eberle.

No. 150. Mayne E. Parker, 1902 Bellefontaine St., Indianapolis, Ind., rec. by A. H. Dewey and W. F. Gidley.

No. 151. Miss Beatrice W. Fansler, 1015 South Washington St., Marion, Ind., rec. by A. H. Dewey and L. Atkinson.

No. 174. Lillian Varsanger, 2354 Milwaukee Ave., Chicago, Ill., rec. by Mrs. M. M. Gray and Wm. B. Day.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

# COUNCIL LETTER No. 25.

Philadelphia, Pa., June 3, 1915.

To the Members of the Council:

Gentlemen—*Motions No. 39 (Appropriation of \$50 for A. Ph. A. Buttons and Pins), and No. 40 (Election of Members; Applications Nos. 132 to 174, inclusive)*, have each received a majority of affirmative votes.

The following letter was received on May 31, 1915:

Mr. J. W. England, Secretary of the Council, American Pharmaceutical Association, Philadelphia, Pa.:

MY DEAR SIR—The Bellevue Hotel is to be the Headquarters of the A. Ph. A. meeting at San Francisco, as you are aware. The change in the program proposed by Dr. Wulling is approved by the local committee.

I find it necessary to resign as Local Secretary as I am obliged to be away from San Francisco during the entire month of June and probably also the greater part of July. Mr. A. L. Leber, of 930 Tenth Street, Oakland, California, has been recommended to take my place. Mr. Leber has the leisure necessary to attend to the work, and is withal a good man for the place. I will turn over to him the correspondence and will assist him as much as I can. Yours very truly,

ALBERT SCHNEIDER.

*Motion No. 41 (Resignation of Local Secretary Albert Schneider).* Moved by G. M. Beringer, seconded by J. W. England, that the resignation of Albert Schneider as Local Secretary be accepted.

The Local Secretary is an officer of the Association, and must, of necessity, be a member. A. L. Leber of Oakland, California, is not a member of the American Pharmaceutical Association, and, of course, is ineligible for election as Local Secretary; a telegram was immediately sent to John H. Dawson, Associate Editor of the *Pacific Pharmacist*, asking him to consult the local members for choice of successor to Local Secretary Schneider, and the name of Mr. Dawson himself is recommended; address *Pacific Pharmacist*, 723 Pacific Building, San Francisco, Cal.

*Motion No. 42 (Election of John H. Dawson as Local Secretary to succeed Local Secretary Albert Schneider, resigned).* Moved by G. M. Beringer, seconded by J. W. England, that John H. Dawson be elected Local Secretary to succeed Local Secretary Albert Schneider, resigned.

Prompt action by the Council is necessary and members are requested to send in their votes soon.

J. W. ENGLAND,

Secretary of the Council.

415 N. Thirty-third Street.

<>

COUNCIL LETTER No. 26.

Philadelphia, Pa., June 9, 1915.

To the Members of the Council:

Gentlemen—*Motions No. 41 (Resignation of Local Secretary Albert Schneider), and No. 42 (Election of John H. Dawson as Lo-*

*cal Secretary to succeed Local Secretary Albert Schneider, resigned),* have each received a majority of affirmative votes.

In Council Letter No. 14 (January 15, 1915), a tentative program for the sixty-third annual meeting of the American Pharmaceutical Association, to be held at San Francisco during the week of August 9 to 14, 1915, was submitted by the Committee on Program, and suggestions invited. The program as finally prepared is now submitted as follows:

Monday—

9:00 A. M.—Meeting of the Council.

#### COUNCIL LETTER No. 27.

Philadelphia, Pa., June 21, 1915.

To the Members of the Council, Gentlemen:

*Motion No. 43 (Approval of Program for 1915 Annual Meeting)* has received a majority of affirmative votes.

Chairman Frank H. Freericks, of Section on Education and Legislation, wishes a 'Joint Session of the Section on Education and Legislation with the American Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy,' scheduled for Thursday, August 12, 1915, at 2 p. m., and to this, it is presumed, there will be no objection.

*Motion No. 44 (Election of Members)*. You are requested to vote on the following applications for membership:

No. 175. Walter C. Roessner, 204 W. Randolph St., Chicago, Ill., rec. by Wm. Gray and E. N. Gathercoal.

No. 176. Frank I. Given, M. D., Hillsboro, New Mexico, rec. by B. Ruppe and Wm. B. Day.

2, to 2d Division.

Clyde A. Speight, from Evacuation Hosp.  
2, to 2d Division.

&lt;&gt;

## U. S. PUBLIC HEALTH NOTICE.

Acting Assistant Surgeon Wyatt Barnes.  
Granted three days' leave of absence from  
June 1, 1915. May 29, 1915.

Pharmacist J. V. LaGrange. Granted one  
day's leave of absence, May 28, 1915. May  
28, 1915.

Pharmacist C. G. Carlton. Directed to  
proceed when necessary to the trachoma hos-  
pitals at Hindman, London, and Jackson, Ky.,  
and to the trachoma hospitals to be estab-  
lished in Virginia and West Virginia to at-  
tend to details connected with their estab-  
lishment and maintenance.

Pharmacist J. Y. Breckenridge, Jr. Directed  
to proceed immediately to Vineyard Haven,  
Mass., for temporary duty. May 29, 1915.

## BOARDS CONVENED.

Medical officers assigned to duty on Coast  
Guard Retiring Boards as follows:

Baltimore, Md.: Surgeon C. W. Vogel,  
Assistant Surgeon J. M. Stewart.

Boston, Mass.: Surgeon B. W. Brown.  
Acting Assistant Surgeon F. H. Cleaves.

New York, N. Y.: Senior Surgeon G. W.  
Stoner. Passed Assistant Surgeon C. P.  
Knight. May 26, 1915.

Official:

A. H. GLENNAN,

Acting Surgeon-General.

&lt;&gt;

## MARGARINE FROM SUNFLOWERS.

The production of margarine from sun-  
flower seeds is the latest device attributed to  
the German Government to meet the expected  
scarcity of butter, according to a dispatch to  
the Exchange Telegraph Company from Am-  
sterdam. The message says the Prussian Min-  
istry of Railroads has ordered all station mas-  
ters to plant sunflowers in every bit of avail-  
able ground around the depots.

Sunflower seeds, it is claimed, yield an oil  
that can be used in the manufacture of sub-  
stitutes for butter.

&lt;&gt;

## FOR SMOKERS ONLY.

Cholly: When I was a boy, you know, the  
doctor said if I didn't stop smoking cigarettes  
I would become feeble-minded.

Miss Keen: Well, why didn't you stop?—  
London Evening Standard.

## Changes of Address

All changes of address of members should  
be sent to the General Secretary promptly.

The Association will not be responsible for  
non-delivery of the Annual Volume or Year  
Book, or of the JOURNAL unless notice of  
change of address is received before ship-  
ment or mailing.

Both the old and the new address should  
be given, thus:

HENRY MILTON,  
From 2342 Albion Place, St. Louis, Mo.  
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications  
or in the official records should be given, and  
names should be *plainly* written, or type-  
written.

&lt;&gt;

WILSON, C. F.,  
From 355 E. 30th St., Chicago, Ill.  
To 6857 S. State St., Chicago, Ill.

POWERS, EMMETT,  
From 932 E. 25th St., Denver, Colo.  
To 919 E. 25th St., Denver, Colo.

RILEY, J. A.,  
From 355 W. 123d St., New York, N. Y.  
To Residence unknown.

YEOMANS, S. C.,  
From Long Beach, Cal.  
To Residence unknown.

GORDON, JEAN,  
From Englewood Hospital, Chicago, Ill.  
To 1415 Byron Street.

HENRY, ARTHUR M.,  
From Tallahassee, Fla.  
To Homestead, Fla.

STAMM, DONALD F.,  
From Chestertown, Md.  
To Easton, Md.

VENNEMANN, H.,  
From 200 W. Indiana Ave., St. Paul, Minn.  
To 1023 White Bear Ave., St. Paul Minn.

ROON, LEO.  
From 15 Main St., Port Washington, N. Y.  
To Broadway and Baxter Ave., Elmhurst,  
L. I., N. Y.

DIETZ, H. W.,  
From Field Hospital No. 4, Ft. Wm.  
McKinley, Rizal, P. I.  
To residence unknown.

## REPORT ON INVESTED FUNDS OF THE ASSOCIATION.

ST. LOUIS, Mo., June 11, 1915.

To the Officers and Members of the American Pharmaceutical Association:

We, the undersigned, have, in accordance with Rule 8 of General Rules of Finance, examined the securities contained in the Association Box (4227) at the Title Guaranty Trust Co., St. Louis, and found the following:

## Ebert Legacy Fund.

St. Louis Bond No. 766.....	\$ 2,000 00
-----------------------------	-------------

## A. Ph. A. General Fund Bonds.

5 St. Louis City Reg. 4 percent Bonds Nos. 705, 706, 707, 708, 709.....	\$ 5,000 00
1 St. Louis City Reg. 4 percent Bond, No. 717.....	5,000 00
Total .....	\$10,000 00

## A. Ph. A. Centennial Fund Bond.

1 Mass. State Reg. 3 percent Bond, No. 1705.....	\$ 1,000 00
--	-------------

## A. Ph. A. Life Membership Fund Bonds.

1 Mass. State Reg. 3 percent Bond, No. 1701.....	\$10,000 00
3 Mass. State Reg. 3 percent Bonds, Nos. 1702, 1703, 1704.....	3,000 00
Total .....	\$13,000 00

## A. Ph. A. Procter Monument Fund.

Certificate of Deposit, No. 62,205, dated January 2, 1915, International Bank of St. Louis (principal).....	\$ 4,812 46
--	-------------

(Signed) H. M. WHELPLEY,  
Treasurer.

(Signed) FRED W. SULTAN,  
Member, Auditing Committee.

Subscribed and sworn to before me this eleventh day of June, 1915.

(Seal) SIDNEY SCHUELE,  
Notary Public, City of St. Louis, Missouri.

(My commission expires November 19, 1917. (Stamp.)

## OFFICERS OF WOMEN'S SECTION

*President*—MRS. JOHN CULLEY, 2579 Monroe Avenue, Ogden, Utah.  
*Honorary President*—MRS. S. A. D. SHEPPARD, 1129 Washington Street, Boston, Mass.  
*First Vice President*—MRS. KITTIE HARBORD GRAVER, No. 2, Bronson Apartments, Ardmore, Pa.  
*Second Vice President*—MRS. HENRY M. WHELPLEY, 2342 Albion Place, St. Louis, Mo.

*Third Vice President*—MISS JEAN GORDON, Englewood Hospital, 60th and Greene St., Chicago, Ill.  
*Historian*—MRS. GEO. B. KAUFFMAN, Worthington Road, R. F. D. No. 7, Columbus, Ohio.  
*Treasurer*—MRS. FRANK H. CARTER, 1555 Broadway, Indianapolis, Ind.  
*Secretary*—MISS ANNA G. RAGLEY, 48 East Patterson Avenue, Columbus, Ohio.

*Executive Committee.*

MRS. J. O. BURGE, one year, 1502 McGavock St., Nashville, Tenn.      MISS ZADA M. COOPER, two years, 124 Bloomington St., Iowa City, Iowa.  
MRS. JOHN G. GODDING, three years, 278 Dartmouth St., Boston, Mass.

*Membership Committee.*

MRS. M. M. GRAY, *Chairman*, 1151 Gladys Ave., Chicago, Ill.      MISS MARY L. CREIGHTON, 611 Indiana Ave., Urbana, Ill.  
MISS ALICE HENKEL, Connecticut Ave., Chevy Chase, Md.      MRS. C. T. P. FENNEL, 614 West Court St., Cincinnati, Ohio.  
MRS. C. A. SLOVER, 1360 Massachusetts Ave., Cambridge, Mass.

*Press Committee.*

MRS. G. D. TIMMONS, *Chairman*, 158 Greenwich St., Valparaiso, Ind.      MRS. ST. CLAIR RANSTORF GAY, 2787 Broadway, New York City.

No. 8

Office of Publication, 63 Clinton Building, Columbus, Ohio.

Subscription, \$4.00 per annum, within the United States. To Canada, \$4.35. To other foreign countries in Postal Union, \$4.50 per annum. Single copies, 35 cents.

Entered at the Postoffice at Columbus, Ohio, as Second-Class matter.

Papers and communications for insertion in the JOURNAL should be sent to the Editor, E. G. Eberle, 63 Clinton Bldg., Columbus, Ohio. Subscriptions should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

The Association does not accept the responsibility for the opinions of contributors. Offensive personalities must be avoided.

## William Martin Searby

William Martin Searby, fifty-fifth President of the American Pharmaceutical Association, was born at Croft, Lincolnshire, England, January 21, 1835, where he also received his early education.

When fifteen years of age he passed his apprenticeship examination with the Pharmaceutical Society of Great Britain. In 1853 he entered the laboratory of the Royal Pharmaceutical Society of Great Britain at the Square, London, where he was granted special advantages by Mr. Braithwaite, Professor Redwood's assistant, in charge of the laboratory.

He passed the major examinations in 1856 at Apothecaries' Hall, London, and thereafter engaged in the drug business with his brother, Wright Searby, at Norwich. Four years later he came to Victoria, B. C., where he opened a pharmacy and continued in business here until 1865, when he located in San Francisco.

The fire, following the earthquake of 1906, destroyed the several stores Professor Searby was interested in, his home and with it his library and other valuable personal belongings. The climax of his trials came in the loss of his life companion, whose death was hastened by their heartrending experiences.

It was largely through Professor Searby's efforts that the California Pharmaceutical Society and California College of Pharmacy were organized; to these he always remained loyal and in them was ever a sincere and earnest worker. The California Pharmaceutical Society bestowed many honors upon him and several times chose him for presiding officer. He was dean of the California College of Pharmacy and held the chair of Materia Medica up to the time of his demise.

Professor Searby's activities in the American Pharmaceutical Association date from 1882 and terminated with his death October 7, 1909. He served with distinction in various capacities and invariably discharged the duties of office conscientiously and efficiently. In 1907 he was elected president of the Association and presided over the deliberations of that body at the meeting in Hot Springs.

He was kind and courteous, very considerate of others, but if he differed in opinion with friends, he unhesitatingly expressed his views and unflinchingly stood for whatever he thought just and right. "The beauty and purity of his domestic life was a setting for his character: His graceful method of speaking, with his clearness in teaching, made him a leader."

## Contributed and Selected

### THE BRITISH PHARMACOPŒIA OF 1914.

#### FROM A BRITISH POINT OF VIEW.

DR. FRED. B. KILMER.

The British citizen, and particularly the British pharmacist, is quite liable to manifest some restlessness whenever any new phase or change is brought into his daily routine. Hence, after a period of about sixteen years, the appearance of a new edition of the British Pharmacopœia has had an upsetting influence upon practitioners of medicine, and of pharmacy, and as is usual with the Britisher, his uneasiness finds its outward manifestation in the form of lengthy communications to the press, and in this particular case in numerous papers before medical and pharmaceutical meetings.

It is true that the new Pharmacopœia was issued at an inopportune time. It was originally scheduled to appear at a time about coincident with the opening of the great European war, but the official publication was postponed until the last day of December, 1914.

Many pharmacists are of the opinion that the publication might well have been deferred until the war was over, and some even go so far as to say that "no great injury would have been inflicted if the issuance had been postponed indefinitely."

A prominent feature of the publication of this edition was that, concurrently, there appeared numerous guides, handbooks and commentaries which seemed to convey the impression that the newly revised work was not in itself entirely complete. Immediately upon its publication there also appeared the usual number of medical and pharmaceutical critics, who assailed it from almost every standpoint, one of them even going so far as to state that it was in its essence simply a wholesalers' Pharmacopœia, the result of an organized effort on the part of the wholesale trade, combined with an autocratic tendency on the part of certain physicians whose recommendations had been accepted. A very prominent pharmacist in Scotland stated that "the benefits arising from all of the changes are nil, and the folly of some of them will be apparent when several people have been poisoned."

On the other hand, it is charged that it is a physicians' Pharmacopœia, and that the pharmacist had little or no hand in its revision. There is some force in this statement when we consider that the revision of the British Pharmacopœia is by virtue of an Act of Parliament vested in the General Medical Council, a body made up entirely of medical men. In the present revision the Council had recourse to a so-called Pharmacopœial Conference made up of members of its own body and five pharmacists recommended by the Pharmaceutical Societies of the United Kingdom, also of a Committee of Reference in Pharmacy nominated by the Pharmaceutical Society of Great Britain and Ireland.

It would appear that the pharmaceutical bodies were without power in the work of revision, and it is claimed that they had but little influence in the present production. Significant also is the fact that when the revision was all over but the shouting, the Pharmaceutical Society of Great Britain took the following action:

"Having regard to the highly unsatisfactory position of pharmacists in relation to the production of the British Pharmacopœia, this Society should give no further assistance to the work of revision under present conditions."

Taking up in detail some of the criticisms which have been propounded by the users of the new British Pharmacopœia, we find, as might be expected, several strong objections to alterations, readjustments, additions and eliminations; in other words, there would naturally arise in the British mind an objection to any change.

The additions, to the number of forty-three, consist in the most part of pharmaceutical preparations and substances which are well known. Of course the critics have been free to ask the question, "why was one preparation included and another not included?"

The complaint is made that some of the substances omitted are still in frequent use. Among these is the world-wide household remedy—saffron.

A strong protest has arisen in regard to some of the alterations in names, but the revision authorities have claimed that this alteration was, for the most part, a modification, with the intent of giving a more exact definition, and in some instances the alteration of the name is due to a modification of the process.

A feature of some of the alterations is that a number of the solid extracts heretofore known as alcoholic extracts (being hard pasty extracts), now appear in the Pharmacopœia as dry extracts, and in certain instances are standardized. This feature has, in a great measure, been the subject of commendation.

Alteration in the composition of galenical preparations has called forth both praise and criticism. It has been conceded that the bases of ointments have been improved, as well as the bases of various lozenges, and the revisers claim that the alterations in the composition of galenical preparations have been arrived at as the result of careful experimental work.

A flood of criticism has arisen in respect to the alterations in potency. Ten galenical preparations have been increased in strength, some of them it is stated have been dangerously increased. For example—the tincture of aconite strength has been doubled, the tincture of opium has been increased one-third, and the tincture of strophanthus has been increased four times. Indeed, the increase in strength has been mainly in very potent preparations.

Thirteen preparations have been made weaker. A notable decrease in strength is that of the emplastrum belladonnæ; it is now one-half the former strength. The tincture of digitalis is one-fifth weaker, and the tincture of nux vomica is half the former strength. The remarkable, and so-called "dangerous," alteration in the fourfold increase of the tincture of strophanthus, has brought out columns of comment. The tincture of opium, or the well known laudanum, has been increased to a strength so as to require the prescription of a medical practitioner, or conformity to the poisons schedule act, before it can be given out.

But attention is called to the fact that the alterations in strength in the British

Pharmacopœia of 1914 have been very small when compared with the last previous revision of 1898. A host of commenters agree that the advance made in the standardization, especially of vegetable drugs, has been disappointing, and that there still remain numerous preparations in which quantitative tests might have been applied with advantage.

For a conservative body the revisers took a long stride forward in adopting the metric system, and as one writer puts it, placed upon the already overburdened dispensers "the honor, the duty and the inconvenience of introducing the metric system into pharmacy." Strong objection has arisen to inconveniences which will arise in dispensing and prescribing, and the calculation of dosage under the changed system.

The book gives a table of equivalents which it is claimed is not consistent. The adoption of average doses has brought about considerable discussion both in medical and pharmaceutical publications. The British Pharmacopœia clearly lays the responsibility for dispensing excessive doses on the shoulders of the pharmacist. The Pharmacopœia states:

"It must be clearly understood that the "doses" mentioned in the Pharmacopœia are not authoritatively enjoined by the Council as binding upon prescribers. They are intended merely for general guidance and represent, in each instance, the average range of the quantities which, in ordinary cases, are usually prescribed for adults. The medical practitioner will exercise his own judgment and act on his own responsibility in respect to the amount of any therapeutic agent he may prescribe or administer. Where, however, an unusually large dose appears to satisfy himself that the prescriber's intention has been correctly interpreted."

The pharmacists are much alarmed over the dangers liable to arise in the liability to excessive doses by reason of the changed system of weights and measures and the changed strength in many potent preparations.

Reams of paper have been filled with condemnation of the adoption by the revisers of the term "mil" (the contraction of millilitre) in the place of cc. to express cubic centimeter. This is characterized by friendly critics as an "unfortunate decision and places the British Pharmacopœia in a very insular position, at variance with all scientific literature and all other Pharmacopœias." It is predicted that the word will not be used in practice.

In reference to the use of the word "mil" as a substitute for c. c. the "Chemist & Druggist" states that it is strange that countries which have never used the metric system in its completeness should begin by making a muddle of one very important part of it. The use of the term "millilitre" and its abbreviation "mil" has never been known either in pharmacy or chemistry in the countries which use the metric system, and why the British should have taken a new and "wrong" line is difficult to understand.

Abbreviations are a feature of the newer British Pharmacopœia, and while the English mind is quite fond of coining abbreviations, critics complain that some of the official ones go beyond the limit for brevity. They are styled as "ugly" and "many of the abbreviations are horrible."

Worthy of attention is the fact that no critic has called attention to errors, and it is claimed that they are remarkably rare, which brings to mind the rather

lengthy table of errata that was published conjointly with the appearance of the Eighth Revision of the U. S. P.

Americans are accused of boasting, but no eulogist on the United States Pharmacopœia ever had the fortitude to reach to the following made in England:

"On the whole the compilers may be said to have succeeded in producing a Pharmacopœia which may be pronounced, without hesitation or reserve, to be the best so far published in this (England) or any other country."

In order to maintain neutrality we place against the foregoing the opinion of a well known German pharmacist, Prof. Raubenheimer, who states that "on the whole the new British Pharmacopœia is no credit to British pharmacy or to pharmacy in general."

A writer in one of the Medical Journals says:

"The new Pharmacopœia has been received very calmly in medical circles. The fact is that its issue has little effect on the present generation of practitioners, whose prescribing habits are fixed and are not to be upset by the edict of the General Medical Council. The alterations are felt as occasion for grumbling rather than gratitude. Pharmacists and students are more concerned than the medical practitioner, and perhaps after all the issue of the new volume is not so earth-shaking an event as its authors imagined it would be."

A very well known British pharmacist writes me:

"I fail to recognize any real advancement medically or scientifically in the new British Pharmacopœia."

One of the most illuminating and candid reviews of the work has been that of George Lunan, F. C. S., who was a member of the Committee of Reference in Pharmacy, and whose high ability is conceded by all. He states:

"This is a national book of medicine. It represents to the practitioner the official guide to his prescriptions, because it represents only ascertained and tried *materia medica*. These are protected by practical standards for his use."

The British Pharmacopœia for 1914 is an Imperial Pharmacopœia made to suit the needs of the whole Empire; hence it must be conceded that it has been no small task to put together a work adapted to a people of such varied races, and to meet the conditions which prevail in a realm which reaches from the North to the South Pole, and upon which the sun continually shines.

In the multitude of publications dealing with applied medicine, the 1914 British Pharmacopœia stands by itself—typical of the nation, stubbornly progressive, accurate and reliable.

Let us not mistake the attitude of the British pharmacist throughout the world in regard to his Pharmacopœia. After he recovers from his first shock of having a new official book of *Materia Medica* thrust upon him, and has relieved himself by a few grumbings, he will begin a most careful study of the book. He will know it from cover to cover. There is one trait in the British pharmacist that gives him a high rank in his life work—he knows his Pharmacopœia and his *Materia Medica*, and he knows it most thoroughly. The British pharmacist will follow the Pharmacopœia as loyally and as devotedly as his fellow compatriots follow the King; he will uphold the Pharmacopœia as bravely as the British soldier upholds the Royal Ensign.

## THE PHARMACY AND MATERIA MEDICA OF THE BRITISH PHARMACOPŒIA OF 1914.\*

---

GEORGE M. BERINGER.

---

The appearance of a revised pharmacopœia of one of the leading nations is an event of general pharmaceutical interest. The importance of such a revision from an American view-point, is greatly enhanced if the pharmacopœia revised is that of a nation whose consanguinity, language and practices are so closely allied to our own as are those of the British Isles. Hence, the appearance of a new British Pharmacopœia during the past year becomes one of the most important pharmaceutical events.

It is apparent that any attempt to review the pharmacy and materia medica of the Fifth Edition of the British Pharmacopœia within the time allotted for a paper presented to a pharmaceutical meeting, must necessarily be cursory and incomplete. Moreover, one is too prone to consider the volume from the view-point of American practice without realizing what has been the aim of the Medical Council and which, in the following statement in the preface, they claim to have accomplished: "has now been able to produce a British Pharmacopœia suitable for the whole Empire." This statement indicates to what extent that ideal of the British government, the solidarity of all of the people of the numerous divisions of the British Empire, has progressed. The present edition displaces not only the edition of 1898, but also the Indian and Colonial Addendum of 1900. The dismissal in the revision of so many of the drugs used exclusively, or nearly so, in the oriental British possessions, indicates the advancement of the movement for uniformity of medical standards and practice throughout the British Empire.

In this revision the Medical Council departed somewhat from the methods of the previous revisions and sought the co-operation of pharmaceutical, chemical and botanical authorities by instituting conferences and committees on reference and thus aimed to obtain information, advice and investigation from many experts outside of the Council.

In this revision the metric system of weights and measures is used throughout, even for the statement of doses, "in the expectation that in the near future the system will be generally adopted by British prescribers." "At the present time students and practitioners of medicine are accustomed to use the metric system in connection with the work of chemical, physical, physiological, pathological and pharmacological laboratories; it will doubtless facilitate the application of science to practice when the same system is used for therapeutic purposes also." We sincerely trust that in this respect the British practitioners of medicine, veterinary medicine, and pharmacy are more ready to adopt this innovation than have been their American brethren in these professions. The term "cubic centimeter" is displaced by "millilitre" and in the statement of doses in the metric system this is abbreviated to "mil" and the fractional portions are "decimil" and "centimil."

In the preface, it is recommended that prescribers cease to employ the long-used

---

\* Read at meeting New Jersey Pharmaceutical Association, 1915.

symbols for drachm and ounce as they are apt to be misread, and are used at times to convey different meanings. The symbol  $\bar{\text{z}}$  for example "is to represent sometimes 480 grains, sometimes 437.5 grains and also to represent 1 fluid ounce."

The preface likewise defines what is meant by a percentage solution; "thus a solution of '1 in 10' or '10 per cent.' means that one gramme of a solid or one millilitre of a liquid is contained in ten millilitres of the solution." This statement is not strictly accurate nor is it in accord with the exact meaning of the word percentage.

In considering synonymy, only the most important of the synonyms employed in prescribing have been inserted. Abbreviations of the Latin titles have been adopted and published as a table in the Appendix. In this the revisers were undoubtedly influenced by a foreknowledge of the intent of the U. S. P. IX in this direction.

The acceptance of the principles of "The International Agreement" promulgated by the International Congress for the Unification of the Formulæ for Potent Drugs and Preparations held at Brussels in 1902, has necessitated some changes in this edition of the British Pharmacopœia. The practice of Great Britain as well as America has been to measure liquids by volume and solids by weight and this has been maintained instead of following the custom of continental practice and endorsed by that Agreement, of weighing liquids as well as solids.

The substances added are not numerous and are covered in a list of 43 titles. Cantharidin replaces Cantharis and Mylabris and is used in all of the galenicals in which these drugs were formerly directed, on the basis of the average content of 0.5 percent. of cantharidin in Cantharides which quite likely is the average yield of the pure active principle. This change has necessitated a change in titles of preparations to Acetum Cantharidini, Emplastrum Cantharidini, Tinctura Cantharidini, and Unguentum Cantharidini.

Diluted Hydriodic Acid is admitted for the purpose of making the syrup which is likewise on the list of admissions.

Cassia Fructus, cassia fistula pod, is admitted for the purpose of giving a formula for "Cassia Pulpa," which should more correctly be entitled an Extract.

Senna Fructus, the senna pod, is another new title. Senna pods are official in several of the European pharmacopœias and their use is extending likewise in the United States.

Under the title of Ipomea Radix the Orizaba Jalap Root is admitted with the synonym of Mexican Scammony Root. This has been done to permit its use as a substitute for the true Scammony Root for the preparation of Scammony Resin.

Scammony resin is defined as a mixture of resins obtained from Scammony Root or from Orizaba Jalap Root. This is an unfortunate exhibition of legalizing a specious fraud that has been extensively carried on in the substitution of the chemically different resin of ipomea for that of Scammony. The requirement of "not less than 75 percent. soluble in ether" shows how deliberate the purpose.

Cresol is one of the additions and as a preparation Liquor Cresol Saponatus made with castor oil and potassa soap, a good preparation with which we are not unfamiliar.

Formaldehyde is admitted and Liquor Formaldehydi Saponatus is a soft soap.

(from olive oil and potassium hydroxide), hydro-alcoholic solution of formaldehyde and should prove a useful addition to the antiseptics.

Among Ointments and Ointment bases we note that a formula for benzoinated prepared suet has been introduced and it is recommended that in India this should be employed instead of Benzoinated Lard in making ointments. Unguentum Lane Compositum, a mixture of prepared lard 40, wool fat 40, paraffin ointment 20, is a recruit with the synonym of Emollient Ointment. A veteran in American practice, Goulard's Cerate, with a modified formula with camphor omitted, is admitted under the title of Unguentum Plumbi Subacetatis.

The list of deletions is a formidable one of 168 titles. A number of these are oriental drugs that probably have gone out of use because of the change of medical practice in the colonies. There are, however, in this category a number of titles of old friends such as Camboge, Cimicifuga, Coca Leaves, Conium Fruit and Leaves, Crocus, Elaterium, Humulus, Jaborandi, Lupulin, Mezereum, Musk, Pareira, Physostigma, Sarsaparilla and Sumbul.

Among the preparations dismissed, we note a number of decoctions and infusions and the concentrated liquores introduced in the edition of 1898 for the purpose of permitting of the extemporaneous preparation of decoctions and infusions. It would seem that the "Liquores Concentrati" met with little favor and further that English practice is gradually being weaned from the copious draughts of infusions and decoctions of drugs.

Our British brethren have shown some further appreciation of the advantages of powdered extracts and have adopted the powdered form for a few additional extracts, notably, the extracts of belladonna, hyoscyamus, nux vomica and opium. The diluent directed in the extracts of belladonna and hyoscyamus is the powdered respective drug of determined alkaloidal content. In the extracts of nux vomica and opium, calcium phosphate is directed as the diluent and in the extract of strophanthus, milk sugar. The degree of fineness of the powder specified under extract of belladonna is a number 20 sieve. This certainly will yield a rather coarse powder. The menstruum directed for extract of belladonna and hyoscyamus is 70 percent. alcohol. A stronger alcoholic menstruum is necessary to obtain a powdered extract of proper strength and permanent fineness of powder. Where formulæ are given for both the liquid and the dry extracts of the same drug, the word "Siccum" is added to the title of the latter. It would seem to have been preferable to have uniformly used this term in the titles of all such dry extracts.

In the Latin titles 38 changes have been made. Most of these are of a minor character and for the purpose of more exactly defining the official articles or preparations. Aloe now covers both Aloe Barbadosensis and Aloe Socotrina of the previous edition, and Senna Folia includes the former Senna Alexandrina and Senna Indica. Kino Eucalypti replaces the less appropriate Eucalypti Gummi, and Oleum Chaulmoogre replaces Oleum Gynocardiae. Among preparations, we note that Tinctura Iodi Fortis replaces Liquor Iodi Fortis and Tinctura Iodi Mitis replaces Tinctura Iodi. The stronger contains 10 Gm. of Iodine and 6 Gm. of Potassium iodide in 100 millilitres and corresponds closely to the Tincture of Iodine of the International Agreement. The Tincture of Iodine of the British

Pharmacopœia 1898, contained only 2.5 Gm. each of iodine and potassium iodide per 100 millilitres; hence, this is now to be known as the "weak."

Important changes in the strength of 41 preparations have been made. The reason for many of these is apparent; for some, however, the reason is not evident. The endeavor to harmonize the potent galenicals with the standards of the International Agreement accounts for the changes in Syrup of Ferrous Iodide, a number of the tinctures and in Mercury Ointment.

Syrup of Ferrous Iodide contains 5 percent. of ferrous iodide and 10 percent. of glucose as a preservative.

Tincture of Aconite is about twice as strong as that of the Pharmacopœia of 1898, and is directed to be made with 70 percent. alcohol and then assayed and standardized so that 100 mls contain 0.04 Gm. of the ether soluble alkaloids. This formula agrees in the menstruum with that directed by the Brussels protocol, and starts with 150 Gm. of aconite yielding doubtlessly a good preparation, but it would be difficult to establish that it is "approximately the same strength as the Tincture of Aconite of the International Agreement."

Tincture of Belladonna is to be made by percolating 100 Gm. of the powdered leaves with 70 percent. alcohol and in addition is standardized to contain 0.035 Gm. of the alkaloids in 100 millilitres.

Tinctures of Colchicum and Digitalis likewise agree closely with the requirements of the protocol.

Tincture of Nux Vomica is to be made from the Liquid Extract by diluting and is standardized so that 100 millilitres contain 0.125 Gm. of strychnine.

Tincture of Opium is made from the Gum Opium and standardized so that 100 millilitres contain 1 Gm. of anhydrous morphine. The product will correspond to the International Agreement in alkaloidal (not alcoholic) content and will be about one-third stronger than the Laudanum of the previous edition.

In Tincture of Strophanthus, we have a straddle. In attempting to comply with the requirement of the protocol 100 Gm. of ground seeds and 70 percent. alcohol are directed, but the de-fatting of the drug with ether is prescribed. The foot-note states that "this tincture is made with four times the proportion of seeds ordered by the previous pharmacopœia and it is approximately the same strength as the Tincture of the International Agreement." This formula is, however, subject to several criticisms. It is entirely proper to de-fat the drug before making the tincture, but the de-fatting should be with purified petroleum benzin and not with ether because the latter extracts a portion of the strophanthin. The percolation with ether should not be "until the liquid passes through colorless," but should be continued until a few drops evaporated from filter paper leave no greasy stain. Alcohol of 90 or 95 percent. will not entirely extract strophanthus in the proportion directed and much less will alcohol of 70 percent. serve this purpose. A more serious error is the direction to discontinue the percolation with the alcohol when 500 millilitres are obtained and then to add sufficient 70 percent. alcohol to obtain 1 litre. Under these conditions, the drug will probably be not more than one-half extracted.

The diluted acids, with the exceptions of Diluted Acetic Acid (5 percent.  $\text{H C}_2\text{H}_3\text{O}_2$  and Diluted Hydrocyanic Acid (2 percent  $\text{HCN}$ ), are now uniformly

10 percent. of the respective absolute acids, instead of the odd proportions of the 1898 Pharmacopœia which had Diluted Hydrochloric Acid 10.58 percent. HCl.; Diluted Nitric Acid 17.44 percent  $\text{HNO}_3$ ; Diluted Phosphoric Acid 13.8 percent  $\text{H}_3\text{PO}_4$ ; and Diluted Sulphuric Acid 13.65 percent  $\text{H}_2\text{SO}_4$ .

In the text, the Aromatic Waters are directed to be made by distilling the water in some cases with the drug and in other cases with the volatile oil. In Chapter XII of the Appendix under Alternative Preparations Sanctioned for Use in Tropical, Sub-tropical, and Other Parts of the British Empire, it is stated, "Aquæ Olei Anethi, Anisi, Carui, Cinnamomi, Foeniculi, Menthæ Piperitæ, Menthæ Viridis.—Each of these Waters may be prepared by triturating the corresponding oil with twice its weight of Calcium Phosphate and five hundred times its volume of Distilled Water and filtering the mixture. In tropical and sub-tropical parts of the Empire, these Aquæ Olei may be used in place of the corresponding Aquæ of the Text of the Pharmacopœia."

It is exceedingly doubtful if this territorial restriction will be observed by the practical pharmacists of Great Britain, once they become as fully acquainted as are their American brethren, with the easy and practical method of preparing saturated aqueous solutions of these aromatic oils by the use of an insoluble distributing medium. It will be difficult to convince the practical pharmacist that such waters as peppermint and spearmint must be prepared by distilling the oil and water instead of a simple process of solution or that these waters of the British Pharmacopœia are superior because of such exposure to heat.

The unsatisfactory and tedious process for Extract of Ergot of 1898, is replaced by a process in which the ergot is extracted by water, the aqueous extract concentrated and alcohol added; after standing the liquid is filtered off and evaporated to proper consistence.

Extractum Filicis Liquidum is made with ether and corresponds to our oleoresin of male fern. Description, tests and assay process for filicin are introduced and the product is standardized as containing 20 percent. of filicin.

Extractum Glycyrrhizæ is to be made by macerating liquorice root with chloroform water, expressing and heating the expressed liquid to  $100^\circ$ , then straining and evaporating. The Liquid Extract is made by a similar process, the alcohol being finally added only as a preservative.

Extractum Hydrastis Liquidum is to be prepared with 60 percent. alcohol (instead of 45 percent. in 1898) and to be standardized to contain 2 Gm. of hydrastine in 100 mls. of the product.

Extractum Ipecacuanhæ Liquidum is to be prepared by extracting with 90 percent. alcohol without the treatment with lime as directed in the pharmacopœia of 1898 and is to be standardized so that 100 mls. shall contain 2 Gm. of alkaloid.

Extractum Nucis Vomice Liquidum is to be prepared with 70 percent. alcohol, the fat removed by treatment with melted hard paraffin, and the product standardized to contain 1.5 Gm. strychnine in 100 mls. No attempt is made to recover the alkaloid removed by the paraffin de-fatting.

Four formulas are given for hypodermic injections. While there may be good reason to endorse a standard formula for a hypodermic injection of ergot, there is a better reason that would require that this be directed to be dispensed in steril-

ized and sealed ampoules. In this day of universally used, well prepared and stable hypodermic tablets, it seems unnecessary to include in a modern pharmacopœia formulæ for hypodermic injections of morphine, strychnine, etc.

Liquor Ethyl Nitritis is retained as the title for a preparation containing from 2.5 to 3 percent. of ethyl nitrite in a mixture of 95 volumes of absolute alcohol and 5 volumes of glycerin. There is also official the Spiritus Ætheris Nitrosi containing 1.53 to 2.66 percent. by weight of ethyl nitrite in alcoholic solution. The need for both is not understood.

The volatile oils are well defined and generally the necessary tests for identity and quality are clearly given. The assay processes are the simplest that can be satisfactorily applied. Instead of an elaborate process for determining the amount of cineol, the Oils of Cajeput and Eucalytus are assayed by the phosphoric acid method and for pharmacopœial purposes this is probably all that is necessary. In Oil of Lemon, the citral is determined by the hydroxylamine method.

For several decades, at least, the trend of pharmaceutical authorities has been toward a clearer differentiation of the classes of galenicals, toward defining within proper lines each class of preparations and the grouping of the individual formulæ, wherever possible, under such defined classes. It was to be expected that in this revision, these proper classifications would be respected and followed. Yet we find Oleo-Resin of Male Fern, "an oily extract" entitled "Extractum Filicis Liquidum" and printed along with the extracts despite the statement in the preface that "Most of the Liquid Extracts are of such a strength that one hundred millilitres represent one hundred grammes of the drug employed." An acacia emulsion of Castor Oil is classed with the Mistura and printed with such formulas as Chalk Mixture and Compound Mixture of Iron.

The treatment of the botanical drugs is disappointing. There is lacking that thoroughness of description that one would expect in a modern pharmacopœia prepared by those who have every opportunity to be acquainted with the progress of science and the great advances in pharmacognostic knowledge since the appearance of the previous edition sixteen years ago.

The names of the authors of the binomials adopted are given, but in no case is the family or other botanical classification given. The references to the works where the medicinal plants are figured, a feature of the Pharmacopœia of 1898, is omitted and there is good reason to consider that such information is out of place in a pharmacopœia.

In some cases the definition of the drug assumes the style of a rubric and states the alkaloidal standard, in other cases, with equally important drugs this is omitted, as occurs for example in the definitions of Belladonna Root, Hydrastis and Hyoscyamus.

Any one who has occasion to examine crude drugs knows that they are very rarely free from admixtures. Sometimes these admixtures are other portions of the plant yielding the drug and at other times they are unavoidable or accidental foreign substances. No attempt whatever is made to either recognize the presence of such admixtures or to fix limitations therefor.

The descriptions of the macroscopical characters of the drugs show very little improvement over those of the former edition. It is rather the exception that the

description of the histology or microscopical structural characteristics of the drug or of its powder are given with any degree of thoroughness, and the common adulterants and their characteristics are not even mentioned.

While in some drugs a limit of ash has been added, in many others equally important this has been ignored. As examples, the ash of *Lobelia* has been fixed in this revision at "not more than 12 percent.," but for *Hyoscyamus* no limit of ash is given.

The tenacity with which the English people adhere to the tenets and practices of their fathers and forefathers, their aversity to innovations and the making of radical changes, is a recognized trait of the English. This conservatism of the nation, is reflected in their pharmacopœia and while we criticize in a friendly spirit some of its defects and lack of progress, we recognize that it is a safe and practical book of standards for most of the substances prescribed in British medical practice.

---

### MILS VS. CUBIC CENTIMETERS.\*

---

JOSEPH P. REMINGTON.

---

The new United States Pharmacopœia will authorize the use of the word Mils to replace the word Cubic Centimeters, and at first there will be undoubtedly some criticism and comment upon the change. The last United States Pharmacopœial Convention recommended publicity of changes of this kind in order that users of the United States Pharmacopœia would become familiar with the subject in advance.

The use of the word Mil is not new, but the first use in a Pharmacopœia occurred in 1914, when the British Pharmacopœia adopted it, and it is likely that its use will become universal in time, at least in the English language. Mil is, of course, the first three letters of the French name originally given to the thousandth part of a liter—Milliliter. The use of the word Cubic Centimeter is really an anachronism and the United States government through its bureau of standards (see Bulletin No. 47, page 12) has declared the word Cubic Centimeter as a misnomer.

Very careful experiments by the government physicists have determined the fact that the Cubic Centimeter is larger than the Milliliter by the inconsiderable fraction of 0.000027. In pharmacy, in chemistry, and in applied chemistry, this difference is negligible, but everyone must have regretted the cubic centimeter blot on the harmony and beautiful simplicity of the metric system. The unabbreviated word Cubic Centimeter is too long for everyday use by the chemists and pharmacists of the world.

In America nine out of every ten scientific men mispronounce the word and use "sontee-meter," and it seems that this habit is very difficult to break up. It should properly be called "centi-meter" as the word is anglicized. It is a gross grammatical error to use a word which is half French and half English. If one must use the French, it should be pronounced "sonte-matr."

---

\* Read at the meeting of the Pennsylvania Pharmaceutical Association, June, 1915.

In actual practice it will be noticed that at chemists' congresses and conventions nearly everyone reads Cc. as "See-sees." These are some of the results following the original error of adopting such a word as Cubic Centimeter officially. In the Government Tables, Ml is used, but Ml is difficult to pronounce, hence an abbreviation can just as well take in a vowel—the i—, and so we have the first syllable of three letters of the word Milliliter. Now Mil can be used with a period indicating that it is an abbreviation, but it is much better to adopt the word Mil, as it will be called, and do away with the period. This will also permit the use of the plural Mils. If the period is retained, it would be awkward and improper to use the plural as Mils.

It has been stated by a few of the critics and those who always oppose changes that it will be somewhat confusing because we have already a word in the English language "Mill" which is a United States coin, which we never see—the tenth of a cent; but when this word was coined, we had also the word "mill," used for a building for grinding substances, for students who get diplomas from certain schools, and even for pugilistic bouts, and other equally interesting words; but we will have no other Mil in the English language which is spelled with one l and there is no likelihood of mistake or error when the word is used either in speaking or in writing.

Now, practically, we have only to remember never to say Cubic Centimeter or use the abbreviation Cc. again. As previously said, the change is only a change of name. It does not involve any calculations or changes in formulas. Cross out Cc. and write Mil. Never again say sonti-meter, say, Mil; but it cannot be expected that this reform will immediately go into effect and it will take a little time for all of us to become accustomed to the change.

---

## THE RELATION OF CHEMICAL CONTROL TO INDUSTRO-CHEMISTRY.\*

---

EUGENE L. MAINES, PHR. D., SC. D.

---

Successful industries are, for the greater part, dependent upon the chemical laboratory and chemical control.

The excellent laboratory equipment and staff of such establishments as the General Electric Co., Solvay Process Co., Illinois Steel Co., Pennsylvania Railroad Co., Chicago Packing Houses, Parke, Davis Co., etc., proves the truth of this statement.

The constant growth in efficiency of these manufacturing plants is largely the result of organization, and occupying a most important place in such organization, is the research staff, analytical and general testing laboratories.

True, some plants have no chemist at all, and no testing apparatus. Even in Germany there are many plants chemically uncontrolled, working empirically, by formula.

---

\* Presented at the Eighth Annual Convention of the American Association of Pharmaceutical Chemists held in Rochester, N. Y., May 31st to June 5th, 1915. Delivered as a plea for the formation of a "Scientific Clearing House."

It is not difficult, however, to demonstrate that a chemical laboratory pays and pays well. This point has been learned these many years by all progressive superintendents and managers. The cost of a laboratory (although small) shows conspicuously on the books, while the profits made possible by a laboratory may be lost among other figures unless a special search is made for them. Under these circumstances men of little insight will continue to operate their plants without proper scientific control, until by the competition of better managed plants they are forced to adopt modern methods or go out of business.

The successful establishments, as has already been cited, are fully aware of the necessity of chemical control, this being evidenced by their well regulated scientific departments.

When it is realized that these departments should investigate all new processes, constantly improve the existing ones; correct and explain irregularities of manufacturing operations; invent new processes; that they should determine the valuation and exact composition of all raw materials and finished products, the fixing of yields, the necessary control of different stages of many processes, etc., it becomes clear that if these constructive forces are to be used to the fullest it must be through the creation of an organization that will automatically cause every department in that organization to coöperate with the research and analytical branches.

The duties of a research department may be summarized as follows:

Investigating cheaper raw materials, new products, increased yield, new uses for products manufactured, greater purity of products manufactured, utilization of wastes, more efficient structural material, reduction of cost of production, apparatus, etc.

The department should be equipped with research laboratories where work can be carried on from a test-tube scale to manufacturing in a large enough way to test practical difficulties and costs.

The analytical department should control all work relating to sampling and analysis, and its duties may be given generally as follows:

The analysis and sampling of all raw materials and finished products, as well as the analyses necessary in the intermediate steps of some processes in order to insure proper control. It should furnish figures used to calculate yields, and perform all the analytical work in connection with investigations, which often involves the necessity of inventing new methods or investigating and adopting better methods. It should do all analytical work that will aid the manufacturing, sales, purchasing and construction departments, and coöperate with the sales department in investigating complaints.

These, briefly, are the duties of the modern scientific department.

We will now consider the result of this chemical control.

As you have already seen, the chemist or chemical engineer maintains a place in almost every industry and phase of life. He has reduced the cost of living by discovering cheaper edibles and the production of other products from the waste material of former times, such as oleomargarine from packing house material, oils from cotton seeds, glycerin and soap from waste fats, etc.

In mining he has classified the minerals, enabling by simple tests to ascertain the value of each. He has discovered and invented means of reducing the death rate in coal mining by the use of fire damp indicators, rescue outfits, Davey Safety Lamps, and the regulation of explosives.

He has utilized waste coal by converting it into tar, coke, fuel and illuminating gases, ammoniacal liquor, fertilizers, and many colors used in the dyeing industry.

From the coal gas industry we obtain as by-products, coke, gas, carbon, tar, ammoniacal liquor, and spent purifying material.

In gas manufacture we have as subsidiary products, dyes, sweetening principles, and photographic developers from coal tar, while water-gas yields light oils of the benzole series, creosoting oils, naphthalene oils, road compounds and pitches.

From wood he has made paper pulp, ethyl alcohol, methyl alcohol, rosin, tars, potash and many other products. Waste pine wood, stumps, etc., are now converted into turpentine and other by-products, thus saving the valuable timber for lumber.

In the iron industry the flue dust (about 3% of total ore charged) is collected, heated in the oxidizing atmosphere of a portland cement rotary kiln, and is then recovered in nodular forms, carrying over 60% of iron. This alone represents a saving of 1,250,000 tons of iron ore per year.

Slag, which was formerly a waste product is now converted into slag cement which differs very little in chemical analysis, color, specific gravity, fineness or in usefulness from that made by ordinary methods. The potash industry has been controlled by the German Potash Syndicate for many years, but the possible production of potash on a commercial scale, from the kelp of the Pacific coast may yet cause the Germans some uneasiness.

Nitrogen is recovered from coal by the by-product coke ovens and in Germany it is being abstracted from the atmosphere.

During the past quarter of a century chemists have been developing new uses for new materials very rapidly.

A few years ago chromium had little use and metallic manganese was a curiosity but today these metals are used by the ton as pure metals in alloys for electrical resistance, replacing great quantities of German silver and other expensive alloys. Tantalum and Columbium ores were merely an interest in museums, but today they are being worked for the Tantalum (used as a filament for incandescent electric lights and as a substitute for platinum) and undoubtedly the Niobium will soon be utilized.

In sanitation he has done much to reduce contagion, etc., through the application of the pure food laws and the regulation of public water supply and sewage disposal.

Alcohol, formerly produced from corn, can now be produced from saw-dust, the by-products of sugar works and waste sulphite lyes.

Formerly, kerosene was the chief product sought in petroleum and the lighter and heavier fractions were allowed to go to waste. It is now converted into gas, gasoline, naphtha, kerosene, lubricating oils, asphaltic road material and carbon for electrical purposes. The recent discoveries of Dr. Rittman in the petroleum industry may eventually give the United States a supremacy in the dye-stuffs in-

dustry that has so long belonged to Germany, while the increased yield of gasoline may prove an important factor in paying the costs of the process.

In no phase of chemical industry, however, does chemical control play a more important part than in the manufacture of medicine. The doctor must rely upon the chemist to give him reliable and efficient medicinal products. Thus, both drug and finished product must be assayed, tested and standardized so as to insure the physician with a reliable remedy. When it is considered that many drugs are emergency remedies, the life of a patient often depending upon their activity, it is not difficult to understand why the chemistry of medicine is one of the most important branches. But, chemistry, even at its present best, is incapable of assaying the active principle of every drug, as there exists in certain drugs superactive principles of so delicate a composition that they break down under analysis.

At this point we must determine, not "how much of you is present?" but "how much can you do?" Here must the analyst bow to the pharmacologist and depend upon him to ascertain and determine the physiological activity of such drugs as are not amenable to chemical assay. In this way drugs are compared and adjusted to certain definite and uniform standards, thereby making it possible for the physician to determine in advance the actual effect of a given quantity.

Besides the standardization of products, the chemical laboratory is constantly adding new and valuable remedies to the realm of *materia medica* and therapeutics.

Today we are in the very midst of the unfolding of the secrets of immunity and prophylaxis. In fact, we are almost impatient if each succeeding number of our scientific journals does not inform us of some new discovery or means of attack against the common enemy—disease.

Probably more has been achieved within the past quarter of a century than in the whole history of medicine. Certain diseases have almost been eliminated and plague and pestilence no longer terrify; for we have the confidence that their causes, even though still unknown in some cases, are material and conquerable, and that their incidences and ravages may be prevented by measures already known or surely to be discovered.

The recent discoveries in chemistry are so all-important and even revolutionary and its position as a science is so comprehensive that one scarcely dare make any statement or prediction concerning it.

The United States, which until recently has lagged behind some other nations in chemical research, is beginning to atone for past indifference. During the past few years the number of students pursuing courses in chemistry at our various colleges has steadily increased. Despite this fact this shows a comparatively small increase in view of the enormous increase in the industrial operations of the country, constantly demanding trained men.

No small part of Germany's industrial progress has been due to the discoveries of her men of science. It may be that Germany has lent more encouragement to scientific research, but there are signs that her supremacy may be challenged as our young men appreciate the advantages to be derived from the pursuit of what has been termed the most practical of sciences.

These results accomplished by the chemical laboratory and chemical control are little short of wonderful. It has been the work of the chemist, physicist, metal-

lurgist, and engineer, all applying the broad principles of chemistry to industry that has made such important and far-reaching development.

Waste has, in some industries, been reduced to a minimum and their efficiency is great indeed, yet in no single case has perfection been reached.

R. J. STRASENBURGH CO., ROCHESTER, N. Y.

---

## DRUGS AND THE MAN.\*

---

DR. ARTHUR E. BOSTWICK, LIBRARIAN, ST. LOUIS PUBLIC LIBRARY.

---

The graduation of a class of technically trained persons is an event of special moment. When we send forth graduates from our schools and colleges devoted to general education, while the thought of failure may be disquieting or embarrassing, we know that no special danger can result, except to the man who has failed. The college graduate who has neglected his opportunities has thrown away a chance, but he is no menace to his fellows. Affairs take on a different complexion in the technical or professional school. The poorly trained engineer, physician or lawyer, is an injury to the community. Failure to train an engineer may involve the future failure of a structure, with the loss of many lives. Failure to train a doctor means that we turn loose on the public one who will kill oftener than he will cure. Failure to train a lawyer means wills that can be broken, contracts that will not hold, needless litigation.

Congressman Kent, of California, has coined a satisfactory word for this sort of thing—he calls it “mal-employment.” Unemployment is a bad thing. We have seen plenty of it here during the past winter. But Kent says, and he is right, that malemployment is a worse thing. All these poor engineers and doctors and lawyers are busily engaged, and every thing on the surface seems to be going on well. But as a matter of fact, the world would be better off if each one of them should stop working and never do another stroke. It would pay the community to support them in idleness.

I have always considered pharmacy to be one of the occupations in which mal-employment is particularly objectionable. If you read Homer badly it affects no one but yourself. If you think Vera Cruz is in Italy and that the Amazon River runs into the Arctic Ocean, your neighbor is as well off as before; but if you are under the impression that strychnine is aspirin, you have failed in a way that is more than personal.

I am dwelling on these unpleasant possibilities partly for the reason that the Egyptians displayed a skeleton at their banquets—because warnings are a tonic to the soul—but also because, if we are to credit much that we see in general literature, including especially the daily paper and the popular magazine, *all* druggists are malemployed. And if it would really be better for the community that you should not enter upon the profession for which you have been trained, now, of course, is the time for you to know it.

---

\* A valedictory address delivered at the commencement exercises of the St. Louis College of Pharmacy, May 19, 1915, wherein a layman presents his views anent influences affecting pharmacy.

There seems to be a widespread impression—an assumption—that the day of the drug is over—that the therapeutics of the future are to be concerned alone with hygiene and sanitation, with physical exercise, diet, and mechanical operations. The very word “drug” has come to have an objectionable connection that did not belong to it fifty years ago. Even some of the druggists themselves, it seems to me, are a little ashamed of the drug part of their occupation. Their places of business appear to be news-agencies, refreshment parlors, stationery stores—the drugs are “on the side,” or rather in the rear. Sometimes, I am told, the proprietors of these places know nothing at all about pharmacy, but employ a prescription clerk who is a capable pharmacist. Here the druggist has stepped down from his former position as the manager of a business and has become a servant. All of which looks to me as if the pharmacist himself might be beginning to accept the valuation that some people are putting upon his services to the community.

Now these things affect me, not as a physician nor as a pharmacist, for I am neither, but they do touch me as a student of physics and chemistry and as one whose business and pleasure it has been for many years to watch the development of these and other sciences. The fact that I am addressing you this evening may be taken, I suppose, as evidence that you may be interested in this point of view. The action of most substances on the human organism is a function of their chemical constitution. Has that chemical constitution changed? It is one of the most astonishing discoveries of our age that many, perhaps all, substances undergo spontaneous disintegration, giving rise to the phenomena now well known as “radio-activity.” No substances ordinarily known and used in pharmacy, however, possess this quality in measurable degree, and we have no reason to suppose that the alkaloids, for instance, or the salts of potash or iron, differ today in any respect from those of a century ago. How about the other factor in the reaction—the human organism and its properties? That our bodily properties have changed in the past admits of no doubt. We have developed up to the point where we are at present. Here, however, evolution seems to have left us, and it is now devoting its attention exclusively to our mental and moral progress. Judging from what is now going on upon the continent of Europe, much remains to be accomplished. But there is no reason to believe that if Cæsar or Hannibal had taken a dose of opium, or ipecac, or aspirin, the effect would have been different from that experienced today by one of you. This is what a physicist or a chemist would expect. If the action of a drug on the organism is chemical, and if neither the drug nor the organism has changed, the action must be the same. If we still desire to bring about the action and if there is no better way to do it, we must use the drug, and there is still need for the druggist. As a matter of fact, the number of drugs at your disposal today is vastly greater than ever before, largely owing to the labor, and the ingenuity, of the analytical chemist. And there are still great classes of compounds of whose existence the chemist is assured, but which he has not even had time to form, much less to investigate. Among these may lurk remedies more valuable than any at our disposal today. It does not look, at any rate, as if the druggist were going to be driven out of business from lack of stock, whether we regard quantity or variety. To what, then, must we attribute the

growth of the feeling that the treatment of disease by the administration of drugs is on the decline? From the standpoint of a layman it seems to be due to two facts, or at least to have been strongly affected by them: (1) The discovery and rapid development of other therapeutic measures, such as those dependent on surgical methods, or on the use of immunizing serums, or on manipulations such as massage, or on diet, or even on mental suggestion; and (2) the very increase in the number and variety of available drugs alluded to above, which has introduced to the public many new and only partially tried substances, the results of whose use has often been unexpectedly injurious, including a considerable number of new habit-forming drugs whose ravages are becoming known to the public.

The development of therapeutic measures that are independent of drugs has been coincident with popular emancipation from the mere superstition of drug-administration. The older lists of approved remedies were loaded with items that had no curative properties at all, except by suggestion. They were purely magical—the thumb-nails of executed criminals, the hair of black cats, the ashes of burned toads and so on. Even at this moment your pharmacopœia contains scores of remedies that are without effect or that do not produce the effects credited to them. I am relying on high therapeutical authority for this statement. Now when the sick man is told by his own physician to discard angle-worm poultices, and herbs plucked in the dark of the moon, on which he had formerly relied, is it any wonder that he has ended by being suspicious also of calomel and ipecac, with which they were formerly classed? And when the man who believed that he received benefit from some of these magical remedies is told that the result was due to auto-suggestion, is it remarkable that he should fall an easy prey next day to the Christian Scientist who tells him that the effects of calomel and ipecac are due to nothing else than this same suggestion? The increased use and undoubted value of special diets, serums, aseptic surgery, baths, massage, electrical treatment, radio-therapeutics, and so on, makes it easy for him to discard drugs altogether, and further, it creates, even among those who continue to use drugs, an atmosphere favorable to the belief that they are back numbers, on the road to disuse. Just here comes in the second factor to persuade the layman, from what has come under his own observation, that drugs are injurious, dangerous, even fatal. Newly discovered chemical compounds with valuable properties, have been adopted and used in medicine before the necessary time had elapsed to disclose the fact that they possessed also other properties, more elusive than the first, but as potent for harm as these were for good. Many were narcotics or valuable anesthetics, local or otherwise, which have proved to be the creators of habits more terrible than the age-long enemies of mankind, alcohol and opium. When the man whose wife takes a coal-tar derivative for headache finds that it stills her heart forever, the incident affects his whole opinion of drugs. When the patient for whom one of the new drugs has been prescribed by a practitioner without knowledge of his idiosyncrasies reacts to it fatally, it is slight consolation to his survivors that his case is described in print under the heading, "A Curious Case of Umptiol Poisoning." When a mother sees her son go to the bad by taking cocaine, or heroin, or some other drug of whose existence she was ignorant a dozen years ago, she may be par-

doned for believing that all drugs, or at least all newly discovered drugs, are tools of the devil.

And this feeling is intensified by one of our national faults—the tendency to jump at conclusions, to overdo things, to run from one evil to its opposite, without stopping at the harmless mean. We think we are brighter and quicker than the Englishman or the German. They think we are more superficial. Whatever name you give the quality it causes us to “catch on” sooner, to work a good thing to death more thoroughly and to drop it more quickly for something else, than any other known people, ancient or modern. Somebody devises a new form of skate roller that makes roller-skating a good sport. We find it out before anyone else and in a few months the land is plastered from Maine to California with huge skating halls or sheds. Everybody is skating at once and the roar of the rollers resounds across the oceans. We skate ourselves out in a year or two, and then the roar ceases, the sheds decay and roller-skating is once more a normal amusement. Then someone invents the safety bicycle, and in a trice all America, man, woman and child, is a wheel. And we run this good horse to death, and throw his body aside in our haste to discover something new. Shortly afterward someone invents a new dance, or imports it from Spanish America, and there is hardly time to snap one’s finger before we are all dancing, grandparents and children, the cook in the kitchen and the street-cleaner on the boulevard.

We display as little moderation in our therapeutics. We can not get over the idea that a remedy of proved value in a particular case may be good for all others. Our proprietary medicines will cure everything from tuberculosis to cancer. If massage has relieved rheumatism, why should it not be good also for typhoid? The Tumtum Springs did my uncle’s gout so much good; why don’t your cousin try them for her headaches? And even so, drugs must be all good or all bad. Many of us remember the old household remedies, tonics or laxatives or what not, with which the children were all dosed at intervals, whether they were ill or not. That was in the days when all drugs were good: when one “took something” internally for everything that happened to him. Now the pendulum has swung to the other side—that is all. If we can ever settle down to the rational way of regarding these things, we shall discover, what sensible medical men have always known, and what druggists as well as mere laymen can not afford to neglect, that there is no such thing as a panacea, and that all rational therapeutics is based on common sense study of the disease—finding out what is the cause and endeavoring to abate that cause. The cause may be such that surgery is indicated, or serum, or regulation of diet, or change of scene. It may obviously indicate the administration of a drug. I once heard a clever lawyer in a poisoning case, in an endeavor to discredit a physician, whom we shall call Dr. Jones, tell the following anecdote: (Dr. Jones, who had been called in when the victim was about to expire, had recommended the application of ice). Said the lawyer:

“A workman was tamping a charge of blasting-powder with a crowbar, when the charge went off prematurely and the bar was driven through the unfortunate man’s body, so that part of it protruded on either side. A local physician was summoned, and after some study he pronounced as follows: ‘Now, if I let that bar stay there, you’ll die. If I pull it out, you’ll die. But I’ll give you a pill

that may melt it where it is!' In this emergency," the lawyer went on to say, "Dr. Jones doubtless would have prescribed *ice*."

Now the pill to melt the crowbar may stand for our former excessive and absurd regard for drugs. The application of ice in the same emergency may likewise represent a universal resort to hydrotherapy. Neither of them is logical. There is place for each, but there are emergencies that can not be met with either. Still, to abandon one method of treatment simply because additional methods have proved to be valuable, would be as absurd as to give up talking upon the invention of writing or to prohibit the raising of corn on land that will produce wheat.

No: we shall doubtless continue to use drugs and we shall continue to need the druggist. What can he do to make his business more valued and respected, more useful to the public and more profitable to himself? For there can be no doubt that he will finally succeed in attaining all these desirable results together, or fail in all. Here and there we may find a man who is making a fortune out of public credulity and ignorance, or, on the other hand, one who is giving the public more service than it pays for and ruining himself in the process; but in general and on the average personal and public interest run pretty well hand in hand. Henry Ford makes his millions because he is producing something that the people want. St. Jacob's Oil, once the most widely advertised nostrum on the continent, cost its promoters a fortune because there was nothing in it that one might not find in some other oil or grease.

What then, I repeat, must the pharmacist do to succeed, personally and professionally? I welcome this opportunity to tell you what I think. My advice comes from the outside—often the most valuable source. I have so little to do with pharmacy, either as a profession or as a business that I stand far enough away to get a bird's-eye view. And if you think that my advice, based on this view, is worthless, it will be a consolation to all of us to realize that no force on earth can compel you to take it.

It is doubtless too late to lament or try to resist the course of business that has gone far to turn the pharmacy into a department store. But let me urge you not to let this tendency run wild. There are side-lines that belong properly to pharmacy, such as all those pertaining to hygiene or sanitation; to the toilet, to bodily refreshment. I do not see why one should not expect to find at his pharmacist's, soap, or tooth-brushes, or sponges. I do not see why the thirsty man should not go there for mineral water as well as the dyspeptic for pills. But I fail to see the connection between pharmacy and magazines, or stationery or candy. By selling these the druggist puts himself at once into competition with the department stores. There can be no doubt about who will win out in any such competition as that. But I believe there is still a place in the community for any special line of business if its proprietor sticks to his specialty and makes himself a recognized expert in it. The department store spreads itself too thin—there is no room for intensive development at any point of its vast expanse. Its general success is due to this very fact. I am not now speaking of the rural community where there is room only for one general store selling everything that the community needs. But my statement holds good for the city and the large town.

Let me illustrate by an instance in which we librarians are professionally in-

terested—the book store. Once every town had its book-store. Now they are rare. We have few such stores even in a city of the size of St. Louis. Every department store has its book-section. They are rarely satisfactory. Everybody is lamenting the disappearance of the old book-store, with its old scholarly proprietor who knew books and the book-market; who loved books and the book-business. Quarts of ink have been wasted in trying to account for his disappearance. The Public Library, for one thing, has been blamed for it. I have no time now to disprove this, though it is very clear to me that libraries help the book trade instead of hindering it. I shall simply give you my version of the trouble. The book-dealer disappeared, as soon as he entered into competition with the department store. He put in side lines of toys, and art supplies, and cameras and candy. He began to spread himself thin and had no time for expert concentration on his one specialty. Thus he lost his one advantage over the department store—his strength in the region where it was weak; and of course he succumbed. If you will think for a moment of the special businesses that have survived the competition of the department store, you will see that they are precisely the ones that have resisted this temptation to spread themselves and have been content to remain experts. Look at the men's furnishing stores. Would they have survived if they had begun to sell cigars and lawn-mowers? Look at the retail shoe stores, the opticians, the cigar stores, the bakers, the meat markets, the confectioners, the restaurants of all grades! They have all to compete with the department stores, but their customers realize that they have something to offer that can be offered by no department store—expert service in one line, due to some one's life-long training, experience and devotion to the public.

I do not want the pharmacist to go the way of the book dealers. Already some of the department stores include drug departments. I do not see how these can be as good as independent pharmacies. But I do not see the essential difference between a drug department in a store that sells also cigars and stationery and confectionery, and a so-called independent pharmacy that also distributes these very things.

I am assuming that the druggist is an expert. That is the object of our colleges of pharmacy, as I understand the matter. As a librarian I want to deal with a book man who knows more of the book business than I do. I want to ask his advice and be able to rely on it. When I have printing to be done, I like to give it to a man who knows more about the printed page than I do. When I buy bread, or shoes, or a house, or a farm I like to deal with recognized experts in these articles. How much more when I am purchasing substances where expert knowledge will turn the balance between life and death. I have gossiped with pharmacists enough to know that all physicians do not avoid incompatibles in their prescriptions, and that occasionally a combination falls into the prescription clerk's hands, which, if made up as he reads it would produce a poisonous compound, or perhaps even an explosive mixture. Two heads are better than one, and if my physician ever makes a mistake of this kind I look to my pharmacist to see that it shall not reach the practical stage.

I recognize the great value and service of the department store, but I do not go there for my law or medicine; neither do I care to resort thither for my

pharmacy. I want our separate drug stores to persist, and I want them to remain in charge of experts.

And when the store deals in other things than purely therapeutic preparations—which I have already said I think probably unavoidable, I want it to present the aspect of a pharmacy that deals also in toilet preparations and mineral water, not of an establishment for dispensing soda-water and soap, where one may have a prescription filled on the side, in an emergency. And when the emergency does arise, I should have the pharmacy respond to it. It is the place where we naturally look in an emergency—the spot to which the victim of an accident is carried directly—the one where the lady bends her steps when she feels that she is going to faint. In hundreds of cases the drug store is our only standby, and it should be the druggists business to see that it never fails us. There are pharmacies where a telephone message brings an unfailing response; there are others to which one would as soon think of sending an inquiry regarding a Biblical quotation. To which type, do you think, the public will prefer to resort?

Then there are those little courtesies that no retail business is obliged to offer, but that the public has been accustomed to expect from the druggist—the cashing of checks, the changing of bills, the furnishing of postage stamps, the consultation of the city directory. There can be no reason for resorting to a drug store for all these favors except that the pharmacist has an enviable reputation as the man who is most likely to grant them. And yet I begin to hear druggists complaining of the results of this reputation, of which they ought to be proud; I see them pointing out that there is no profit on postage stamps and no commission for changing a bill. They intimate, further, that although it may be proper for them to put themselves out for regular customers, it is absurd for strangers to ask for these courtesies. I marvel when I hear these sentiments. If this popular impression regarding the courtesy of the druggist did not exist, it would be worth the expenditure of vast sums and the labor of a lifetime to create it. To deliberately undo it would be as foolish as to lock the door in the face of customers.

I do not believe that in St. Louis the pharmaceutical profession is generally averse to a reputation for generous public service, and I base my belief on some degree of personal knowledge. The St. Louis Public Library operates about sixty delivery stations in various parts of the city. These stations are all in drug stores. The work connected with them, though light, is by no means inconsiderable, and yet not one of the druggists who undertake it charges the library a cent for his space or his services. Doubtless they expect a return from the increased attractiveness of their places to the public. I hope that they get it and I believe that they do. At any rate we have evidence here of the pharmacist's belief that the bread of public service, cast upon the waters, will sooner or later return.

You will notice that I am saying nothing about advertising. One would think from the pharmaceutical papers, with which I am not unfamiliar, that the druggist's chief end was to have a sensational show window of some kind. These things are not unimportant, but I do not dwell on them because I believe that if a druggist realizes the importance of his profession; if he makes himself

a recognized expert in it; if he sticks to it and magnifies it; if he makes his place indispensable to the community around him, the first point to which the citizens resort for help in an emergency, an unfailing center of courtesy and favor—he may fill his window with toilet soap, or monkeys, or with nothing at all—there will still be a trodden path up to his door.

Gentlemen, you have chosen as your life work a profession that I believe to be indispensable to human welfare—one of enviable tradition and honor and with standing and reputation in the community that set it apart, in some degree from all others. And while I would not have you neglect the material success that it may bring you, I would urge you to expect this as a result rather than strive for it as an immediate end. I would have you labor to maintain and develop the special knowledge that you have gained in this institution, to hold up the standard of courtesy and helpfulness under which you can best do public service, confident that if you do these things, business standing and financial success will also be added unto you.

### THE SCIENCE OF PHENOMENA.\*

---

J. ROEMER.

---

An interesting presentation relating to the "Science of Phenomena, as applied to drugs, basing the action of such on the energy within the atoms and molecules, which through electro-motive forces of the body in reaction is transformed into kinetic energy, resulting in the Phenomena of Drug Action."

In presenting the subject, "The Science of Phenomena," it may appear that the title is inadmissible, according to the usual interpretations accredited to science and that there is an error in its meaning, but an analysis will prove that such is not so and moreover that previous scientific interpretations are inadequate in explanation.

That explanation of phenomena has always been the objective of science is manifest from investigation of methods employed in endeavors of explanation in the realms of its varied applications in search for truth, but that it in itself can become and is the ultimate science, has until recently not received the recognition that it merits.

Phenomena of science are the accumulated array of facts which through investigation and research are continuously amassing without consistent or reasonable co-relations to one another and therefore unless it finds the means to relate and co-relate these phenomena as concepts to the mind progress is slow, therefore in designating the subject, "*The Science of Phenomena*," we not only postulate a title but open up a channel to the better understanding of their relations.

---

\* Read before New York Branch, A. Ph. A.

The subject becomes one of direct concern to all manifestations as presented in the universe, but whether from cause to effect or from effect to cause cannot be fully known without a clear conception as to *why* of all.

That this great and momentous question is ever and ever farther removed from the immediate knowledge of man is axiomatic, for the greater increase of that knowledge ever becomes the incentive to ever greater research.

In order to thoroughly encompass facts deducible as knowledge, we must formulate a starting point and follow a procedure of correct interpretation, then safely conclude that from out of all confusion we will yet see the light in answer to that greatest of all questions concerning science, the *why* of things.

The subject as "*The Science of Phenomena*" finds application to all that is, but the object in this presentation is to restrict and confine its application to that division of science which relates to medicine and to the accepted designation, pharmacology.

To answer the question *why* is the object of all investigation and research and until today there is no definite answer to much that concerns medicine.

As postulate to a starting point we must begin with mind and likewise following phenomena through their varied phases must also end with mind.

The mind operates through a controlling force; that which it apprehends is a concept, apprehension itself is a result of perception and perception a result of conscious sensory impression, and knowledge becomes the direct manifestation of this phase system.

Without a something to apprehend there would be no need of mind, much less a use, and to supply that something in its widest, broadest and most comprehensive latitude we will accept it as the universe and all the manifestations as concepts conveyed or imparted by whatever forces may operate we will name phenomena.

These then become the fundamentals which to the mind we must relate and co-relate and by successive steps through interpretations prove the greatest of all questions.

We can know phenomena *as manifestations only by physical aspects which result from inherent physical properties.*

Physical properties, however determined, are cause per se of phenomena and in light of known knowledge are nothing more and nothing less than *natural properties*, it is therefore axiomatic that by and through natural properties alone can we obtain knowledge.

As human beings and the more so as scientists we are concerned with correct interpretations, we cannot create, we cannot alter, we cannot destroy, we are ourselves wholly controlled by what we know to be fundamental natural laws; these laws, through invariability and immutability in operation give rise to phenomena through forces, and these forces are the influences which determine all.

In entering the world governed and controlled by forces, science must concern itself with the operations of these forces, for it is through correct interpretation of such alone that we are able to prove cause to effect and conversely effect to cause.

Evolution in understanding has been slow to progress for the materialistic

conception of the ultimate of matter has long held the stage and as a barrier has denied even the presumption to other reasoning.

With the advent of the dissociation theory and its comprehensive underlying fundamental as explained by electronic phenomena and a clear insight into the physics of radium, we are entering a field in which we are beginning to appreciate that we are no longer concerned with matter as substance, but that far beyond this lies the reality which as manifestation to us is a phenomenon of *energy*.

In the element radium we find the master key that will unlock the storehouse to greater and wider knowledge and much that has been misunderstood or not understood at all will find herein the beacon light to the greater sphere of our universe.

At the January meeting of this Branch details of the history of discovery and of the peculiar properties of radium were thoroughly presented, yet in order not to lose sight of the wonders that this element reveals to us it may not be amiss to tabulate the known physical properties.

As men of science looking for truth and as scientists concerned with elucidation and solution of problems that appear complex, we must have the courage to recognize and to accept the truth when we find it, and regardless of any prejudice, regardless of any bias or of any ideas or opinions, we must follow the trail, no matter how, for it will take us from the beaten paths of the present misconceptions.

And so radium has given us a truth, we are familiar with the electronic conception and we can thereby explain its apparently peculiar properties; these in general are as follows:

Ray radiations, consisting of alpha, beta and gamma.

Ray emanations, which in loss are regenerated within the atom; these emanations are subject to reaction, to decompositions, and these decomposition products give rise to other elements or pseudo elements.

Through observation and experiment and by calculation we know that this is a phenomenon that continues for thousands of years and have ascertained that these radiations and emanations are *energy charges*.

To sum up the known properties of the energy radiations as observed in beta rays, we know they are:

Negatively charged electrical particles.

Their velocity is about one hundred thousand miles a second.

Their mass is equal to one-eighteen hundredth of the mass of hydrogen.

They represent mass and inertia.

They discharge electrified bodies.

They are deflected in opposite direction from the positive charge by the magnet.

They give rise to light and heat in bodies which they strike.

They communicate mechanical motion to bodies.

They are absorbed by bodies in direct proportion to the density of those bodies.

In other words the atom of radium is an atom of *energy*, a potential energy that is inherent or intrinsic, and this energy is available as kinetic energy and through transformation is dissipated into heat and light.

Leaving out of consideration for the time being the physical manifestations of the other rays we can thus graphically illustrate the beta rays as follows:

Radium	Beta Rays	Potential	Kinetic	Heat
	as Energy			Light

This being true of the element radium with evidence to support that truth, it becomes a truth transcendent that it is *true for every element*.

Natural law is universal and invariable, gravitation acts upon all things in like manner, there is no exception, and as controlling force is immutable, and likewise the forces which govern and control the element radium are the forces which govern and control every other element.

To this in our daily applications in the field of what we as yet choose to designate chemistry we have ample opportunity of demonstrating the truth of this proposition, we can consider any reaction occurring and in the light of the electronic conception we can no longer maintain that elements per se as substance react with one another, but must correctly interpret these phenomena as the interchange of energies of the elements, or in other words the action and reaction of their electrical charges.

Without the necessary influences which free these energies we can have no phenomena of reactions and it therefore follows that through correct interpretation the whole structure upon which chemistry is reared becomes one of exchange of physical forces and must be viewed as the "science of pure physics."

Chemistry must give way, for in the light of a better and more comprehensive understanding there is *no* chemistry. This as a science has been built up from the past imagination of the atom as ultimate of matter without a clear conception that beyond this phase lies the true solution of the reality in the electron, which electron we now conceive as electrical charge.

Each and every statement will no doubt find its need for defense, and to those who have followed the past ideas in relation to elements it will become most difficult to overthrow old conceptions and accept the new. It is not my purpose to argue with needed proofs in relation to what has been given. This is but preliminary to that which I have chosen as the subject for tonight and even that is but a detail to the greater application of the theory of energy.

The subject "*Phenomena of Drug Action*" therefore becomes a detail of the greater subject "*The Science of Phenomena*," and as this is related to pharmacology, I'll endeavor to confine myself to that part.

In order more fully to appreciate the shortcomings of each and every previously advanced theory of drug action it may not be amiss to give a little consideration to the ideas prevalent today in that respect.

There are numerous theories held as well as defended as to how drugs act. Let me make the bold statement that each and every one is based upon misconception and therefore misunderstanding and consequently all are erroneous; we have no one theory that explains the action of all drugs, and as to the question *why* drugs act there now is no light upon this subject.

In the presentation tonight of the subject, "*The Phenomena of Drug Action*,"

as embodied in the "*Theory of Energy*," with full and comprehensive conception of the fundamentals, there will be given, I believe for the first time an adequate idea of the reason for such action, not alone answering the question how, but also encompassing the reason why, and in following the elaboration or unfolding of this theory it will at the same time give a clear understanding in relation to these actions by showing they could not act otherwise.

That there is dissatisfaction with present ideas and theories of drug action is apparent; when giving instruction or in trying to predicate the action, failure results in obtaining such information, and however much we may desire to hold to ideas that drugs act, we cannot overlook the fact that there is something lacking to support our ideas; there is something lacking; drugs do not act, they never did act, they never can act.

That the many theories advanced, supported and even defended may argue for correctness for any given class of drugs is the very proof which defeats such theory in not being able to encompass all drugs, and it is admitted that there is no positive law or rule upon which to date we can account for the varied phenomena as manifested by the administration of drugs.

*If a theory cannot account for every fact relating to that theory, it then, by reason of that failure becomes untenable for any fact.*

To analyze the shortcomings of every previously advanced theory would take too much time. Sufficient to note and emphasize is the point that if we had an adequate theory that alone would be sufficient and we would not have the many that are extant today.

Yet, without bearing in mind the salient points of the more prevalent ideas, it may be difficult to comprehend their applications and shortcomings: one theory assumes action upon physical properties of solubility, rate of diffusion and absorption. These may influence phenomena of action, yet the theory falls in failing to co-relate allied drugs, as example, acetanilide and antipyrine, and further does not give information of how action is brought about.

Another theory assumes properties based upon chemical constitution, another upon molecular arrangement, another combines the two, then we have the biochemical theory and a few more of less import. They each relate a few drugs to answer their particular application and were the time longer it can readily be proven that each and every one in light of facts is untenable, and the conclusion is inevitable that science has not given us a clear understanding of what is meant by drug action.

In the scope of inclusion for the theory to be advanced there are no exceptions and all drugs, whether of animal, vegetable or mineral origin, find the true reason for phenomena produced. *They do not act.*

There is so much confusion and so much that is fundamentally erroneous in conception, in term, in phraseology, in explanation and in definition in medicine, pharmacology, biology, bacteriology, chemistry and physiology, and in short in every subject related to medicine that any attempt to reconcile the conflicting ideas is impossible, so in order more fully to comprehend the application of *the theory of energy*, in relation to phenomena, we must divest our minds of all the misunderstanding and clear it from the cobwebs of present conception so that

we can grasp the import of the reality and apply the correct interpretations to the facts.

To give you a little idea of the shortcomings of the branch of science as medicine, let me cite a few fundamentals whose answers medicine has not yet supplied and in which that science is woefully cast adrift.

The purpose in submitting these questions in this relation is not for criticism but for the reason of obtaining a better understanding for which the *theory of energy* will supply the answers and supply them correctly.

*Why is the blood a circulating fluid?*

*Why does it contain two kinds of cells?*

*Why would not either the white or red alone do?*

*Why are these cells circulating and not anchored?*

*Why are they circulating in a media called plasma?*

*When pus is the result of any suppuration, why is it that the white cells alone constitute that pus?*

*What is the cause and the reason of an elevation of temperature due to infection or suppuration?*

*Why is the stomach secretion acid?*

*Why is it hydrochloric acid? Why not nitric or phosphoric, or citric or mayhap a specific acid of individual human characteristic?*

*Why is sodium chloride a constituent of the secretion of the stomach?*

*Why is not the stomach alkaline and the intestine acid?*

*Why is the normal temperature within the range of 98.4 and 98.6 degrees F. and not 90 or 100 degrees F.?*

*If tubercle bacilli are the cause of tuberculosis, why is not every one susceptible? Why is one being immune and another not? This has never been answered, even with the theory of immunity.*

*Why has not the cause of nephritis long since been answered, surely there is data enough?*

*Why has not science given the why of serum reactions?*

*Why has not science as yet found the origin of cancer?*

*Why is the air we breathe three-fourths nitrogen and only one-fourth oxygen? To say that the nitrogen acts as dilutant to the energetic oxygen is not the reason; it is only a guess and a very crude one at that.*

*Nitrogen performs a most important function, it has its purpose and there is a most substantial reason for its wide prevalence.*

So in light of this we must acknowledge that science hasn't given us a great amount of knowledge that is fundamental. It has been said that if we could answer these questions we could explain life itself. However this may be, I will say that we can answer them, we can answer them correctly and the facts to verify are so strikingly and palpably evident that it is nigh unbelievable that we have missed them for so long.

This subject is so vast that you will appreciate the utter inability of entering into the details of even a few of the salient points given and the presentation of the detail "*Phenomena of Drug Action*" as a part of the "*Science of Phenomena*" becomes a large subject in itself and even in this I must confine myself to a very limited field for want of time.

We first must disabuse our minds that drugs act. This is fundamentally an error and to further maintain that idea is to maintain a contradiction.

*It is when we subject substances to given influences that we observe phenomena of action.*

If drugs acted we could anticipate the same result within a corpse as we could within the living body. If again the substance of a drug produced an action we must not forget that we would lose that substance, but we know better than that, for we can recover the substance in its entirety, weight for weight, even though it suffers many transformations in its passage through the body.

I am familiar with all the objections that science and medicine as science will advance to account for the difference, but it still remains an unanswered fact that if drugs did act we should obtain like results both in the live body and the corpse; yet strychnine has no more effect upon or within the corpse than has milk sugar or sodium bicarbonate, and when we analyze this fact instead of evading the question we will find the reason *why*, and this will be an answer to a very important fact.

Take a normal healthy living being and if conditions could be such that we could administer a dose of strychnine one minute before death we would observe certain specific phenomena. Now as the result of accident this normal being is killed and one minute after death this body has not had the time to alter any of its organs, nor of its tissues, the blood is still normal and in every respect this body so far as we are able to determine is exactly like the living body, yet if we administer a hundred times the quantity that we did one minute before death, there is no phenomena observed or produced. We can go still further, we can cause absorption by the body fluids, we can by force diffuse it through the blood stream, but no matter what we do there is no response.

This then becomes a most important link and we must account for something in the living body that the dead body does not possess. There is a difference and in this difference we find the reason, everything material is the same, exactly the same, and the difference is that the corpse has lost its power to transmit *energy*. What kind of energy? It is not its potential energy for that in the short space of time has not been dissipated and is still locked up within the cells, but failing in its power of transforming and transmitting this potential we can only conclude that the loss is *Kinetic*. The flow having been interrupted or prevented and unless the power exists to re-establish that flow the potential alone is useless to maintain life.

*This kinetic energy is an electromotive force, it acts and responds to reaction, to government and control through influences and agencies of like electromotive forces and action and reaction resultant are mathematically proportionate to the degree of influence.*

No action of any substance per se can influence it, and unless a substance possess an electromotive force inherent or acquired that substance is wholly inert or passive to influence a manifestation as phenomena of action.

I won't go into the explanation of the system nor of the manner in which this electromotive force is conducted or distributed throughout the body, but I will ask you to accept it as fact that this force is stored within the brain cells

and from there through radiation carried to every cell of the body and that as a direct current of energy flow.

Accepting this, how can we now apply this idea in relation to what we understand, although erroneously, "drug action"?

Strychnine is	$C_{21}H_{22}N_2O_2$
Morphine	$C_{17}H_{19}NO_3$
Cocaine	$C_{17}H_{21}NO_4$
Hydrocyanic acid	$C\ H\ N$
Nitroglycerine	$C_3H_5N_3O_9$

Disregard all ideas of all theories advanced to account for "drug action" and follow the one idea of the energy stored or locked within the molecules of these particular drugs, energy which is potential but which through the influence of the operation of the electromotive force of the body is released and through reaction is transformed into kinetic.

Strychnine then possesses an energy which is capable of producing an alteration of the body current which results in the phenomenon of interruption, increasing in intensity as the amount given increases until a quantity is given whose released energy is greater than the power of the body's energy to overcome, producing the successive phenomena of first activation, or excitation, then spasmodic contraction, then shock and finally death.

Do these actions as phenomena differ in any way from the alternating electric current, first as to power of such current inducing interruption of the body current as manifestation of activation, then through increase spasmodic contraction, then shock and finally if power is still more increased, death?

Does it differ in its phenomena from the phenomena of tetanus?

Does it differ in its phenomena from that produced by radium?

It does not, and in all cases cited, apparently widely divergent, instead of assuming we are dealing with four different conditions we are dealing with one and the same fundamental cause and that is action as manifestation of phenomena and the phenomena are but the results of one and the same energy; potential energy which through influence is converted to kinetic and the kinetic in its powers increased until it overcomes the kinetic energy of the body.

If this is true it may be argued, why not at once determine the potential and through influence of transformation, the kinetic power of energy that any one substance is capable of producing and employ only that one as agent for every condition of abnormality and disease? The question elaborates a far greater reach than at first is apparent; first, complexity of the body in toto containing numerous elements; second, the fact of different influences, and third, the fact that in the atom radium we find different kinds and degrees of energy and each subject to influences of different degrees, yet considered in its broadest aspect, it is not too far a reach to anticipate that when we obtain more knowledge of the subject, that the power locked up in the atoms and the molecules of a substance may accomplish far greater results than even our imagination at present would permit us to deny.

We are entering into a new realm. From ideas of all other theories we can

never hope to fathom the power of energies locked up waiting for science to open. We do know that the atom of radium is controlled by forces; we know that its intrinsic energy in quantity is enormous; we know that this manifests itself in different degrees; we know that it is subject to control by other forces, and as fundamental, the forces that control the atom are the same forces that control the molecule and the forces that control the molecule are the same forces that control the mass, so we must look to the atom for the solution of the many perplexing problems that science today as yet does not appreciate and following the course of the influences which control the atom, we are sure to fathom the reason of the *why*?

To revert to the tabulated list of drugs, we will take morphine. From its chemical constitution we should certainly not be unreasonable to expect this drug to act similarly to strychnine. It contains, like strychnine,  $C\ H\ N\ O$ . That the difference in quantities does not give us reason for such wide difference in action must be admitted and that molecular arrangement is wholly an assumption in this instance is also known, but considered in the light of the theory of contained energy we can readily account for its phenomenon as resulting in its power of diminishing the energy of the body and in this manner by suspension causing inaction and if given in too large a quantity causing entire suspension or death.

Cocaine likewise as manifestation possesses its particular degree and kind of energy; our old ideas that it paralyzes nerve endings when locally applied is merely an invention of a phrase to explain what is not understood. Cocaine never paralyzed a nerve. When a nerve is exposed, severed, injured or in any way lacerated, there is a manifestation of pain. When then cocaine is applied the pain ceases, not through any paralysis, but through the result of an energy action which restores equilibrium to that nerve circuit supply.

Administer a lethal dose of hydrocyanic acid and we know that death will follow immediately. Herein we have the most striking illustration of an action so-called which up-sets every theory under the old idea of drug action, whether of solubility, rate of absorption, diffusibility, chemical constitution, molecular arrangement or any other advanced idea, the result in death is too swift for any theory to account for the rapidity of its influence, but viewed in the light of what actually takes place that of a transformation of its potential to kinetic energy through influence of reaction to the electromotive force of the body we can account for the power of this nitro compound in like manner as we can account for the released energy of nitroglycerine, and for this we cannot maintain that it is the substance which acts for we know that it is a power of the released energy which possesses a force sufficient to shatter rocks.

It is a matter of no little concern as well to understand why it is that these substances are so energetic. I do not want to digress too much, as this particular phase is another detail of infinite magnitude as another link in the chain of "*The Theory of Energy*" and would take hours to present, but sufficient for the time is the fact that all these substances named contain a common elementary constituent and that is *nitrogen*.

Nitrogen is harmless you will say. We breathe quantities of it every minute. You might also say that albumen contains nitrogen and this is surely innocuous,

in fact so much so that it is the very substance that is the food for embryonic life, and to all this I agree. Nitrogen is the food, per se harmless, also apparently innocuous, but permit me to add that because science has as yet not placed its true function, it is not strange that you should entertain such ideas. The reason that such large quantities exist in the air we breathe, the reason that it is a constituent of albumen and to the other extreme that it is contained in every alkaloid and also the common constituent of each and every seed throughout all plant life are the very reasons that this elementary substance becomes at once the most important substance known in the whole realm of the universe in its specific relation to life.

Nitrogen, not oxygen, is the essential to life. Oxygen is needed, and to a great extent we know the functions it performs, but without nitrogen there would be no life of any kind for it is the fundamental element whose function is to transform the energies which govern and control life. Of this I hope at some future time to tell you something more.

What I want to dwell upon now is the electromotive phase which influences energy action as applied in the idea of "The Phenomena of Drug Action."

Being concerned with drugs as remedial substances or agents we must not overlook the important fact that fundamentally the body is governed and controlled through energies. This through equalized distribution is the reason for health, and when through influences any or all parts do not receive an equal amount needed or required to maintain equilibrium, abnormality and disease are then a consequence.

The human system contains from 65 percent to 70 percent water. This we know is nature's greatest reagent, without which no reaction between the forces of elements would take place; this is the medium which carrying salts in solution effects distribution to each and every cell of the body. Sodium chloride is the predominant salt and from facts proven through physics, we know that sodium chloride is the most perfect electrolyte as neutral salt known in nature; biology and geology both, tell us that life found its origin in the ocean and we know that the water of the ocean contains three and a half times more sodium chloride than all of its other mineral constituents combined, originating under these conditions. We are the product or result of these conditions and considered from these two factors alone, our system then becomes or rather is the ideal system for action and reaction governed by electromotive forces. Added to this the intricate net work of nerves whose function is to convey, conduct and radiate currents, we can readily understand how the body generates, supplies and distributes its electric currents.

In introducing a greater amount of sodium chloride than is needed to maintain an equilibrium, we intensify and excite the influence of the electromotive force of those parts with which it comes in contact. If administered into the stomach it activates that organ to greater activity and passing to the intestines likewise intensifies action and catharsis is the result. Given in solution into the blood stream it intensifies energy flow and the phenomena of its action is wholly through its inherent power as an electrolyte and not because of the substance as sodium or chlorine.

So we must measure the degree of activity of all salines according to their

electrolytic power and in degree as such force is inherent in them as mathematically available energy, we will be able to determine their place in specific order whether they will prove cathartic, purgative, laxative or normalizer.

As substances then we do not, cannot lose them. Transformations to different molecular compounds through reaction may take place, which again, is but the exchange of their physical energies, and it is the energies of the substances that in reality produce, as results, what we incorrectly understand as drug action.

Following out the idea of energy phenomena, facts innumerable support the idea and through such we will be able to relate the various properties of drugs. Taking the following, we can readily understand the phenomena of their behavior, in which an

Astringent is any substance or force of weak electrolytic power.

Calefacient, one of increased electrolytic power.

Rubefacient, one still greater.

Vesicant, still more, and

Escarotic of such power as to wholly overcome the power of the system's force or current.

In comparison with the force of heat or electricity with substance or matter we can establish a true relation and that we are no longer dealing with different agents, but that we are dealing with the energies which in degree produce the like results that we reasonably anticipate they should.

Thus we can invade the field of the "*phenomena of drug action*," and apply our ideas in elaboration in differentiating between stabilizers or normalizers, antiseptics and disinfectants and obtain the clear cut conception in results obtained.

A stabilizer or normalizer, whether as substance or as the force as heat or electricity or as radium itself, is one in which the equilibrium of energy forces are maintained; in other words, in which the reaction of their energies is maintained in a state of equal exchange: an antiseptic, in which the energy of the agent is greater than the energy of the surrounding influence and a disinfectant one, in which the energy is so great in power that it wholly overcomes the energy of invading organisms. We view this phenomenon when substances are employed, erroneously as the activity of substance, when in reality it is energy whose action is identical with heat, light or electricity.

That the energy of the body is the basic and fundamental starting point becomes evident. That the storehouse is the cells of the brain has been amply demonstrated. That government of control is through radiation in distribution by nerves, and through these every cell of the body is governed and controlled, that the food we eat, the water we drink and the air we breathe are the sources of supply. Nitrogen is the one element whose function is to transform the obtained energy into available energy as potential and the function of its regulation and distribution is effected by the nervous system. When interference occurs to the supply to any particular part, it is then that equilibrium is disturbed and abnormality and disease are the consequences and result. Following this it will become of primary importance to determine the normal amount in supply needed for the entire system and also for each particular part and by means of such

determinations the coming physician will be not alone able to obtain a clear and correct insight into cause and effect, but will be able to predicate the consequence and result of such interferences for he will then know what is the meaning of vital force. In order to accomplish all this he will through necessity be first, a trained physicist, then a mathematician and lastly an anatomist.

The use for drugs will be planted upon a firm basis if need be found for their use and what we determine as the possibility in action of drugs today we will be able to know as specific tomorrow.

*Drugs per se do not act, it is their inherent energies contained within the atom and these energies through influences of release, react with the energies of the body, and whether substances as agents or force as heat, light or electricity be employed, the results that are manifest are nothing more and nothing less than phenomena of physical transformations of energies.*

In conclusion of this, a preliminary of the subject, appreciation is extended for the aid given by H. T. Kelly, M. D., and St. C. R. Gay.

---

### TO PREVENT TYPHOID.

Edwin O. Jordan, professor of hygiene and bacteriology at the University of Chicago, writing in the Journal of the American Medical Association, gives the following rules for the prevention of typhoid fever:

For the individual:

1. Keep away from all known or suspected cases of typhoid.
2. Wash hands thoroughly before meals. Do not use "roller towels."
3. Use drinking water only from sources known to be pure, or if this is not possible, use water that has been purified by municipal filtration or by hypochlorite treatment or by boiling in the household.
4. Avoid bathing in polluted water.
5. Use pasteurized or boiled, instead of raw, milk.
6. Select and clean with the greatest care vegetables and berries that are to be eaten raw.
7. Avoid eating "fat" raw oysters and, in general, oysters and other shellfish whose origin is not known.
8. Be vaccinated against typhoid in all cases in which any special exposure is known or feared.

For the community:

1. Insist on the hearty co-operation of all persons with an efficient health officer.
2. Require notification and a reasonable degree of isolation of every known or suspected typhoid case.
3. Exercise strict control over the disinfection of known typhoid excreta.
4. Insist on pure or purified water supplies.
5. Require pasteurization of milk supplies.
6. Regard all human excreta as possibly dangerous and control their disposition in such a way as to prevent contamination of food or drink.

## BURETTE—IMPROVED FORM.

JOHN W. FORBING, PH. C., B. S. IN CH.

The accompanying drawing gives the improved form of burette in the vertical position and a section of top in the horizontal.

In volumetric work it frequently happens, even when a large number of burettes is at the disposal of the operator, that solutions must be discharged and new solutions of different character introduced. Ordinarily, to accomplish this, the instrument is emptied of the solution previously contained, washed with distilled water, and, to avoid dilution, a small portion of the volumetric solution to be used is poured in, and the water adhering to the sides washed out several times.

There are, chiefly, two ways in which this is done: the first by closing the top with the thumb and agitating a small portion of the V. S. to be used, emptying and repeating the operation several times; the second without closing the top, bringing the burette to a horizontal position, rotating and balancing the liquid in a manner that it does not escape. The former method is not scientific, nor is it a strictly cleanly way of handling solutions. The latter is clumsy, and, even with the most adept, unsatisfactory.

In placing a bulb similar to that of a thistle-tube on top of the burette, the latter method is easily handled by those even who seldom have occasion to use burettes. When the improved burette, as shown in drawing, is placed in the vertical position, it can be rotated with assurance that the bulb will catch the over-flow, prevent spilling and the running down of the liquid on the outside of the burette. By making the aperture of the bulb somewhat larger than that of the lumen of the burette proper, filling is made easy also, and the necessity for use of a funnel is obviated.

CREIGHTON UNIVERSITY LABORATORIES,  
Omaha.

A NEW METHOD FOR THE QUANTITATIVE SEPARATION OF  
STRYCHNINE AND QUININE.

---

G. N. WATSON, UNIVERSITY OF KANSAS.

---

The chloroplatinate of strychnine is nearly insoluble in water, insoluble in alcohol and practically insoluble in a mixture of alcohol, 90% and dilute hydrochloric acid, 10%. The chloroplatinate of quinine is soluble in water, soluble in alcohol and very readily soluble in the alcohol-hydrochloric acid mixture.

From the above data, the following method has been worked out for the separation of strychnine and quinine that seems to excel in point of accuracy and simplicity any method heretofore published,—the method being especially valuable for the separation of small quantities of strychnine from large quantities of quinine, a condition generally found when these two drugs are prescribed together.

Dissolve .050 to .100 grammes of the mixed alkaloids (depending on amount of strychnine present) in a small amount of the alcohol-hydrochloric acid mixture (about 5 cc.), add 20% solution of platinic chloride, drop by drop, while slightly agitating the mixture, until the precipitation is complete. Add 5 cc. more of the solvent, cover with watch glass and set aside for one hour, then filter through tared filter, wash with alcohol, place in oven, dry at 100° C. for fifteen minutes, cool and weigh. If the proportion of quinine is large, it will be necessary to add 5-15 cc. more of the solvent before filtering. It will also be necessary to decompose the precipitate with alkali, NaOH, recover the strychnine with chloroform, evaporate and reprecipitate the chloroformic residue from a few cc. of the alcohol-hydrochloric acid solvent, with the platinic chloride reagent.

The chloroplatinate of strychnine is yellow in color, crystalline, and has a remarkable lustre. It contains about 62% of the alkaloid and 18% of metallic platinum.

The chloroplatinate of quinine has an orange color and an amorphous appearance.

A trace of chloroplatinate of quinine gives an amorphous appearance to the chloroplatinate of strychnine, a valuable indication of the purity of the strychnine salt.

The amount of strychnine can be calculated from the weight of the chloroplatinate, from the amount of metallic platinum, or directly by the decomposition of the chloroplatinate.

By this method it has been found possible to determine the strychnine in a mixture of .060 of quinine and .002 of strychnine, being about the proportions found in such preparations as Elixir of Iron, Quinine and Strychnine.

In determining the strychnine in the Elixir of Iron, Quinine and Strychnine, it would be necessary to liberate the total alkaloids and proceed with the mixed alkaloids as directed. The quinine can be determined by difference or from the filtrate by making alkaline, shaking out with ether or chloroform and weighing the dried residue.

Gold chloride produces with strychnine a salt having a solubility and other properties very similar, if not identical, with that of the platinic chloride.

ON THE NATURE OF THE SUGARS FOUND IN THE TUBERS OF  
SWEET POTATOES.\*

---

K. MIYAKE.(From the Chemical Laboratory, College of Agriculture, Tohoku Imperial  
University, Sapporo, Japan.)

---

(Received for publication, April 19, 1915.)

This is a second paper on the results of investigations, now being conducted in our laboratory, concerning the sugars in the underground reserve organs of plants.<sup>1</sup>

Stone<sup>2</sup> studied the carbohydrate constituents of the sweet potato and proved the presence of saccharose among the sugars. Other previous investigations have been concerned only with the general composition. Consequently we selected the sweet potato as the object of our second study on this subject, and investigated the nature of the sugars.

## PREPARATION OF THE SYRUP.

One hundred gm. of the finely pulverized material were extracted in a Soxhlet apparatus with ether. After evaporating the ether, the oil-free residue was placed in a 750 cc. Erlenmeyer flask, and extracted daily with 300 cc. of 95 percent alcohol by heating in a boiling water bath, with a reflux condenser. About two weeks were required to remove the last traces of sugars. The combined extracts were filtered to remove the sediment which was formed on standing, and the filtrate was evaporated to a syrupy condition in a partial vacuum. The syrup was purified by shaking with absolute alcohol. The clear solution was decanted and evaporated down to about 10 cc.

The above method of preparing the syrup was once more repeated to get a sufficient quantity of the material for the investigation.

## QUALITATIVE TESTS OF THE SYRUP.

The syrup gave the following qualitative reactions:

1. It had a very sweet taste.
2. It reduced Fehling's solution strongly; after inversion with hydrochloric acid the reducing power is much enhanced, showing the presence of both reducing and non-reducing sugars.
3. It gave Molisch-Udransky reaction with  $\alpha$ -naphthol and sulphuric acid.
4. It gave the characteristic blood-red color on heating with picric acid and caustic soda (reaction of Braum for glucose).
5. It gave the characteristic fiery red color of ketose with resorcin and hydrochloric acid (Selivanoff's reaction).
6. It gave Pinoff's reaction with ammonium molybdate and acetic acid.
7. It did not show any pentose reaction by the phloroglucin method.
8. No mucic acid was produced upon oxidation with nitric acid.

---

\* Journal Biological Chemistry, June, 1915, 503.<sup>1</sup> The first paper entitled On the Nature of the Sugars Found in the Tubers of Arrowhead, is published in the Journ. Biological Chemistry, xv, p. 221, 1913.<sup>2</sup> W. F. Stone: Ber. d. deutsch. chem. Gesellsch., xxiii, p. 1406, 1890.

9. Saccharic acid was detected as acid potassium salt in the oxidized solution of the syrup.

10. It rotated the plane of polarization toward the right; after inversion it was slightly levorotatory.

11. It produced no characteristic mannose phenylhydrazone with phenylhydrazine, either in the original or in the inverted syrup. When the mixture in both cases was warmed in a boiling water bath with acetic acid, the yellowish, well crystallized osazone was produced.

12. Two drop portions of the syrup were placed on object glasses, and inoculated respectively with crystals of glucose, fructose, maltose and sucrose. After twenty-four hours the solution which had been inoculated with sucrose showed the formation of new crystals, while the others remained unchanged.

From the above tests it is evident that the syrup contains both reducing and non-reducing sugars. Moreover, it is safe to conclude that the presence of pentose and mannose molecules is excluded, since no characteristic reactions could be found, as above mentioned.

#### ISOLATION OF SUCROSE.

When the syrup was left untouched for about twenty-four hours, fine crystals were abundantly formed in it. A small amount of 95 percent alcohol was then added to the syrup, the mixture was filtered and the precipitate washed with absolute alcohol and ether. The sugar thus obtained was recrystallized from alcohol. After drying in a vacuum over sulphuric acid the purified sugar was about 2 gm. in weight.

0.6439 gm. of the sugar was dissolved in water, made up to 25 cc. and polarized in a 200 mm. tube, in a Schmidt and Haensch half-shadow polariscope. A dextrorotation of 9.9 on the scale was observed. The specific rotary power is

$$(a)d = \frac{9.9 \times 0.346 \times 25}{0.6439 \times 2} = 66.5 \text{ (at } 20^{\circ}\text{)}$$

The specific rotary power indicates that the sugar under examination is sucrose.

#### PHENYLOSAZONE TESTS.

The mother liquor filtered from the sucrose crystals was concentrated again into a syrup, but it did not show any sign of forming new crystals, even after one week's standing. An attempt was then made to separate and detect the sugars as phenylosazones.

1 gm. of the syrup, 2 gm. of phenylhydrazine hydrochloride, 3 gm. of sodium acetate, and 20 cc. of water were mixed and heated in a boiling water bath. After fifteen minutes yellowish crystals had been produced. At the end of one hour and a half the heat was removed and the crystals were examined under the microscope. None of the other forms, besides the stellate form of yellow needle-shaped crystals which coincides with that of phenylglucosazone was observed. When cooled it was filtered and washed with a little water. Upon recrystallization from 60 percent alcohol and drying over sulphuric acid in a vacuum, the amount was 0.85 gm. The melting point was determined and found to be  $204^{\circ}$ , which coincides with that of phenylglucosazone. Consequently, the osazone under examination is phenylglucosazone.

1 gm. of the syrup was dissolved in 20 cc. of water and inverted with hydrochloric acid in a boiling water bath for about thirty minutes. After it was neutralized with sodium carbonate, 2 gm. of phenylhydrazine hydrochloride and 3 gm. of sodium acetate were added and the mixture was heated in a boiling water bath, exactly in the same manner as above described. After heating for one hour and a half, the crystals were examined under the microscope, but they were all uniform and quite identical with those of phenylglucosazone which was obtained in the previous experiment. When cooled, it was filtered and washed with a little water. The yellow crystals thus obtained were recrystallized from dilute alcohol and dried over sulphuric acid in a vacuum. The product weighed 1.06 gm., and the melting point was found to be  $204^{\circ}$ . The crystalline form and melting point indicate that the osazone obtained was phenylglucosazone without admixture of other osazones.

The osazone test which was made to separate and detect the sugars in the syrup thus did not yield results differing from those obtained by the qualitative tests, as already described. But, as a result of this experiment, the presence of maltose is excluded, since maltose, if present, would have formed an osazone of a melting point very similar to that of glucosazone, but easily distinguishable from the latter by its crystalline form.

#### SUMMARY.

1. Sugar of the sweet potato tubers is made up of both reducing and non-reducing sugar.
2. The reducing sugar consists of both glucose and fructose, while the non-reducing sugar is sucrose.
3. The presence of pentose, galactose, and mannose molecules is excluded. The presence of maltose is also excluded.

---

#### IPPECACUANHA: BOTANICAL SOURCE—MEDICINAL VALUE.

---

MRS. HAMPTON RAY KENASTON.\*

---

**IPPECACUANHA.**—Portuguese form of the native Brazilian word, ipe-kaa-guene, which is said to mean "road-side sick-making plant," or a creeping plant that causes vomiting. The plants are perennial herbs 10 to 20 cm. high, with creeping, woody hypogeous stems. It is somewhat shrubby with leaves elliptical, entire, short-petiole, and with divided stipules. The flowers are white and form a bunch of small flowers upon a long-stalked, terminal head. The fruit is a soft, dark, purplish-blue berry, with characteristic spiral arrangement of the carpels.

The part of ipecacuanha used in medicine is the root obtained from *Psychotria*, or *Uragoga* (*Cephalis*) *Ipecacuanha*, a small shrubby plant of the natural order Rubiaceae. It is a native of Brazil, growing in clumps or patches in moist shady

\* Chairman Committee on Botany and New Medicinal Plants, South Dakota State Pharmaceutical Association.

forests of Brazil and Colombia and is also found in localities adjoining those mentioned, and thrives best in clay soil along the banks of rivers. While it requires a great deal of moisture, it cannot live under water, and consequently in Colombia it is found in its best development in regions where the rainfall is abundant, but where the rivers do not overflow. The root appears to be possessed of very great vitality, for in 1869 botanist M'Nab, of the Botanical Gardens of Edinburg, Scotland, discovered that so small a portion as 1/16 of an inch of the annulated root, placed in suitable soil, would throw out a leaf-bud and develop into a fresh plant, while Lindsay, a gardener in the same establishment, proved that even the leaf-stalk is capable of producing roots and buds; hence there is but little probability of the plant being destroyed in its native habitat. In gathering ipecac, the whole plant is uprooted and the thin and soft rootlets are thrown away and these discarded rootlets serve for reproduction, becoming in a year well-developed plants with valuable roots of their own.

The drug of commerce is procured chiefly from the region lying between the towns of Cuyaba, Villa Bella, Villa Maria and Diamantina in the province of Matto Grosso, and near the German colony north of Rio Janerio. The Sinu River is the ideal region for ipecac. The plant is found in abundance from near the headwaters of this river to near the city of Monteria, about 60 miles from the coast, where the clay formation which ipecac seems to demand stops, and below which point the river is subject to periodical overflows. The growth extends to several miles on each side of the river and also to the more important tributaries of the Sinu, the Esmeraldas, Verde and Manso Rivers. In regions where the water is excessive, such as the valley of the Atrato, the plant, though found, has a poor growth and is of an inferior quality.

The area from which Cartagena ipecac is derived is very extensive and somewhat scattered, though preëminently important is the region of the Sinu River and its tributaries. It is estimated, on good authority, that the land actually covered by the plant must embrace several hundred square miles, though any attempt at an accurate estimate would be useless. A relatively small amount of Cartagena ipecac comes from the Atrato valley, and it is of inferior quality. In addition to the two regions mentioned, there is another, nearer than either of them to Cartagena, called San Onofre. It is traversed by many small streams, none of them navigable. The soil, in addition to the clay so necessary for the successful production of ipecac, contains a considerable amount of sand and humus, formed by the decay of great masses of vegetable matter. The region appears to be of a character that is well adapted to the growth of both rubber and ipecac, which fact is worthy of note for the reason that, in many cases, the same people who gather ipecac collect the rubber milk and by combining the two industries, economy of collecting each is effected. While the ipecac found here in a given area is less than found on the Sinu or Atrato, the quality almost equals that of the Sinu and is far superior to that of the Atrato. A small amount of ipecac is derived from the tributaries of the Magdalena.

It is probable that other localities, especially the areas covered by the rivers and their tributaries flowing from the interior of Colombia into the Amazon and Orinoco are adapted to the production of ipecac and do produce it, but owing to the complete commercial isolation of these sections, their resources are not of-

ferred to commerce or even definitely known. It is not thought that there are any new areas likely to be opened up to commerce in the near future.

The plant is not an object of cultivation in South America, though there is no reason why it should not be, except the fact that it is found wild in such abundance and is gathered from the forests chiefly by the Indians.

Ipecacuanha, although in common use in Brazil, was not employed by the medical profession of Europe previous to 1672. In France, within a few years after that date, it was employed as the chief ingredient in a remedy for dysentery, the secret of the composition of which was purchased by the French Government for 1000 louis d'or, and made public in 1688. The botanical source of ipecac was not accurately known until 1800. The great value of the drug in dysentery, and its rapid increase in price from an average of 2s 9½d per pound in 1850 to about 8s 9d per pound in 1870, led to attempts to acclimatize the plant in India, which, however, have not proven to be a commercial success, owing to the slow growth of the plant and the prices not being maintained at a figure that invited cultivation of the plant for commercial reasons, together with the difficulty of finding suitable spots for its cultivation.

Like other dimorphic plants, ipecacuanha ripens seeds best when cross-fertilized, and in consequence of the botanical culture, presents various forms. The diversity of form is most apparent in the young plants, and tends to disappear with age. *Triosteum Perfoliatum* is a plant belonging to the *Caprifoliaceae* or *Honeysuckle Family*, which is used as a medicine and the rhizome of commerce is known as *Wild Ipecac*. It is a perennial herb with connate-perfoliate leaves and small, orange-red, globular drupes, growing in Canada and the United States as far west as Kansas. Its rhizome is yellowish-brown, somewhat branched, cylindrical, 10 to 20 cm. long, 10 to 15 mm. in diameter, with numerous cup-shaped stem-scars, and coarse, spreading roots; it is rather hard and tough and has a bitter, nauseous taste. *Triosteum* contains an emetic alkaloid, *triostine*, and considerable starch. The seeds of *triosteum perfoliatum* are sometimes roasted and employed like coffee, the plant being known as wild coffee.

The part of ipecacuanha used in medicine is the root, which is simple or divided into a few branches, flexuous and occurs in pieces about as thick as a goose quill, of a grayish-brown or reddish-brown tint externally, having a ringed or annulated surface and exhibiting a white or grayish interior and a hard wiry center. It has a faint rather musty odor, and a bitterish taste. The different kinds known in commerce, (gray, red, brown), are all produced by the same plant, the differences arising from the age of the plant, the mode of drying, etc. It is usually mixed with more or less of the slender subterranean stem, which has a very thin bark, and is thus very easily distinguished from the root.

The root is collected at all seasons, although chiefly from January to March, and is prepared for the market by mere drying. The activity of the drug resides chiefly in the cortical portion, and hence the presence of the stem diminishes its value. The variety imported from Colombia and known as Cartagena ipecacuanha, differs only in its larger size and in being less conspicuously annulated.

Ipecacuanha owes its properties to the presence of rather more than 1% of the alkaloid emetine, which, with the exception of traces, occurs only in the cortical portion of the root. It is a white, amorphous substance, has a bitter taste and

no odor, turning yellow when exposed to air and light, almost an insipid powder, moderately soluble in alcohol, and having all the characteristics of the vegetable alkaloids. There are also present a volatile oil, starch, gum and a glucoside, which is a modification of tannin and is known as ipecacuanhic acid.

In acute intestinal affections Ipecac has achieved its greatest reputation as a remedy, one of its oldest titles being *radix antidysenterica*. Its power over acute dysentery was known to Piso and Helvetius in the 17th century, and was mentioned by Balmain, (1797), Playfair, (1813), Twining, (1831), and Delioux, (1851). The reports upon its effect in acute tropical dysentery by Docker, (1858), attracted general attention, and since the latter date it has been universally recognized as a specific remedy for acute tropical dysentery and that of malarious districts.

The central emetics—those which produce their effect by acting on the vomiting center in the medulla; gastric emetics—those which act directly on the stomach itself.

Ipecacuanha is classed both as a central and as a gastric emetic; when taken by the mouth it acts as a gastric emetic before absorption into the system, and later produces a further and more vigorous effect by stimulation of the medullary centre. It must be remembered, however, that, valuable though these drugs are, their action is accomplished by so much depression, they should never be administered except under medical advice.

Emetine acts as a violent emetic in doses of 1/16 of a grain or even less, and is a powerful poison. The dose of the powdered root is 1/4 to 2 grains when it is desired that an expectorant action result, and 15 to 30 grains when it is given as an emetic, which is one of its most valuable functions. The Pharmacopœias contain a number of preparations of ipecacuanha, most of which are standardized. A preparation from which the emetine has been removed and known as "de-emetized ipecacuanha," is now upon the market and used in some conditions.

When applied to the skin, ipecacuanha powder acts as a powerful irritant, even to the extent of causing pustulation. When inhaled it causes violent sneezing and a mild inflammation of the nasal mucous membrane, resembling a common cold in the head. Small doses of the drug act as a stimulant to the secretions of the mouth, stomach, intestines and liver, and it therefore increases the appetite and aids digestion; it is very frequently employed as an expectorant in cases in which the bronchial secretions are deficient.

Ipecac is imported into the United States free of duty and the annual importations are about 36,500 pounds, the larger portion of which was purchased from Colombia.

## THE PHARMACY OF OXYPINENE.

---

HENRY C. BLAIR.

---

Oxypinene or Pinene Ozonide is so little known to pharmacists, that it may be well first to consider what is known about its composition chemically, and its use therapeutically, before taking up briefly the pharmacy of this most interesting substance.

In the May, 1915, issue of the American Journal of Pharmacy appears an article on Oxy-Pinenes by J. Emile Blomén, A. M., Ph. D.

He says: "Nowhere in nature can be found a more marvelous 'dead' organic substance than this one (Terebinthina) which, like a living being, inhales oxygen from the air and, transforming it, gives it off in another form."

We know that the pinene is the substance that "inhales" oxygen forming oxides which are given off as oxygen. If in place of oxygen, ozone is placed in contact with pinene, under certain conditions it will be "inhaled" and ozonides will be formed which will give off oxygen in a nascent form.

"When ozonides of pinene come in contact with moisture, they are decomposed, forming hydrogen peroxide and oxygen compounds or pinene. On prolonged standing or by heat, intermolecular or auto-oxidation will take place, resulting in the higher oxidation products of pinene, pinonic acid, etc."

Oxypinene or ozonide of pinene  $C_{10}H_{16}O_3$  is a heavy viscid liquid of a light yellow or lemon color, having an agreeable turpentine odor and taste. It is soluble in some fixed oils, most volatile oils, chloroform, ether, alcohol, etc. Dr. Blomén promises to give a history of the uses of the oxypinenes and we hope he will include more of the chemistry also.

Oxypinene is prepared by exposing the vapor of pinene to a current of ozonized air, prepared by the action upon dry air of a high tension electrical discharge. An addition occurs between the pinene and oxygen resulting in the production of a dense white vapor (Oxypinene)."

This description is taken from the very able article by Dr. Bertram H. Waters, M. A., M. D., published in the Medical Record, February 13th, 1915. He says further, that in making oxypinene, only pure pinene and ozonized air should be used.

From clinical observation, Dr. Waters concludes that, "Oxypinene is useful in subacute and chronic affections of the respiratory system and is indicated as a mild stimulant to the mucous membranes and other tissues. When brought in contact with infected surfaces, it inhibits the growth of certain pathogenic micro-organisms, and, by its pathogenic property, increases the circulation in the infected area, thus promoting the destruction of such organisms by phagocytosis."

It is reasonably certain that the treatment of wounds with old turpentine, found by surgeons during the Civil War so useful against gangrene, owed its efficacy to oxypinene in a crude state.

We have been informed that this same old-fashioned treatment is now in use in the German army.

---

\* Read at meeting of Pennsylvania Pharmaceutical Association, 1915.

Ozonide of pinene, or Oxypinene as Dr. Waters calls it, is probably the most concentrated form of the valuable parts of "old turpentine" and therefore, should be particularly valuable in treating wounds, ulcers, etc.

In making pharmaceutical preparations of oxypinene, it must be remembered that decomposition with formation of hydrogen peroxide and pinene compounds takes place when water is used, and unless this is desirable, water is to be avoided.

Also all oxygen compounds loosely combined are more or less dangerous to handle unless care be used. High temperatures are to be avoided or exposure to air for any length of time. For instance, in making an ointment of oxypinene, such bases as ointment of rose water, hydrous wool-fat, etc., are to be avoided on account of the water they contain. Also the ingredients should not be melted together or if they are, the oxypinene should not be added until they are cold as any excess of heat will cause "the intermolecular or auto-oxidation" mentioned by Dr. Blomén in his paper above referred to.

In making suppositories, the heat required to melt a cacao butter base is so little that it need not be considered; but, as oxypinene does not combine well with cacao butter and as there are so many qualities of cacao butter on the market, and as there is another substance superior in every way and inferior in no respect, we need not hesitate to mention Stearate from Coconut Oil as being the best vehicle.

About one percent of oxypinene in rectal and vaginal suppositories has given excellent results clinically.

For use in treating eczema, skin affections, hemorrhoids, etc., a very efficient compound ointment has been in use for some time in an experimental way clinically. It is made by using a base composed of coconut oil and petroleum, talcum, starch, and zinc oxide, resorcinol and oxypinene.

Considerable experimental work has been done in an endeavor to produce a powder for dusting wounds and for internal administration in enteric pill or capsule form. It is believed that diatomaceous earth produces the best results.

A powder made by incorporating one part of oxypinene with two parts of kieselguhr is satisfactory. Such powder should be kept in sealed containers, for not only is oxypinene in this form liable to undergo auto-oxidation, but the kieselguhr seems to have a catalytic action, as the powder gains considerable in weight when exposed to air for a comparatively short time. One would suppose this extra weight to be water from moisture in the air, but careful chemical examinations has proven it to be oxygen. It is therefore a fact that through the catalytic action of kieselguhr, this powder absorbs oxygen from the air, which makes it a more valuable dressing for wounds than it would otherwise be.

Dr. Waters has found Oxypinene Vapor to be a useful form with which to treat disease. It is not a gas but a vapor and is made up of such finely divided particles, that it floats about in the air, resembling smoke. It is produced by bringing pinene ( $C_{10}H_{16}$ ) vapor and ozonized air into intimate contact in a mixing chamber.

Pinene Vapor is produced by allowing a current of dry air to pass over the surface of volatile pinene. The ozone is made by silent electrical discharges in purified air. In order to avoid the production of nitrates and gaseous peroxides, the air which is used in generating oxypinene must first be freed from moisture; this also allows a higher degree of saturation with the volatile pinene.

Oxypinene Vapor may be inhaled mixed with the air of a room or directly from the generator by means of a suitable mask. For the treatment of superficial lesions on the surface of the body, it is used by allowing it to flow directly upon the affected surface.

When inhaled oxypinene acts as a stimulating expectorant. When applied to the skin it acts as an antiseptic stimulant.

#### SUMMARIZING.

Oxypinene is an ozonide of pinene, a chemical compound consisting of one or two molecules of ozone ( $O_3$ ) linked to one molecule of pinene ( $C_{10}H_{16}$ ) the active and chief constituent of oil of turpentine.

It is produced in two forms, a vapor and a pale yellow liquid of honey-like consistency.

On contact with moisture it breaks down into hydrogen peroxide, oxides, aldehydes, and ketones or pinene.

Exposed to high temperature auto-oxidation takes place.

It is useful in treatment of tubercular affections, wounds, ulcers, diseases of the mucous membranes, eczemas, hemorrhoids, etc.

It is an expectorant, stimulant and oxidizing agent.

Mixed with diatomaceous earth, one part to two parts, it makes a suitable powder for dressing ulcers, old wounds, etc.

Made into suppositories with stearate from cocoanut oil, about one percent strength, it is very useful in treating diseases of the membranes when a stimulating, mild antiseptic is required.

In a compound ointment combining astringent and drying properties with its antiseptic and stimulating effect, it is useful in eczemas and in certain cases of hemorrhoids.

The vapor may be inhaled from a generator or indirectly mixed with air.

The liquid may be applied to wounds in its strongest form.

## THE QUALITY OF COMMERCIAL SUGAR OF MILK.\*

---

J. W. ENGLAND.

---

Practically, all the sugar of milk sold in this country is of home manufacture and it compares most favorably with that imported from abroad. Our past experience indicates that the following specifications, in buying sugar of milk, will ensure a product of good quality:

"Sugar of Milk of acceptable quality must be a fine, white, dry, odorless powder of not less than 99.7 percent strength by polariscope containing not more than 0.020 percent of total nitrogen; not more than 0.020 percent fat and yielding not more than 0.050 percent ash. It must comply with the U. S. P. heavy metals test and be neutral to litmus paper. A ten percent aqueous solution must be clear, odorless, colorless and free from mechanical impurities."

---

\* Read at meeting of Pennsylvania Pharmaceutical Association, June, 1915.

Recent analyses of seventeen lots of 150 barrels of 200 pounds each, representing about 500,000 pounds, gave the following data:

No.	Ash	Nitrogen	Fat	
1	0.042	0.018	0.0084	(American)
2	0.024	0.013	0.0096	"
3	0.02	0.01	0.025	"
4	0.0209	0.0061	0.017	"
5	0.006	0.0064	0.0213	"
6	0.066	.....	0.0026	(Foreign)
7	0.011	0.0055	0.014	(American)
8	0.010	0.0058	0.008	"
9	0.014	0.006	0.0052	"
10	0.01	0.006	0.0064	"
11	0.01	0.0083	0.0016	"
12	0.01	0.0083	0.002	"
13	0.01	0.0037	0.0168	"
14	0.022	0.03	0.0155	(Foreign)
X	0.23	0.0102	0.0722	Poor appearance, rejected
15	0.020	0.017	.....	"
16	0.04	0.0065	0.0045	(Foreign)
17	0.02	0.0069	0.0059	(American)

The percentage of absolute sugar of milk, as determined by the polariscope, was not less than 99.73 percent in any of the samples.

The most striking result of the analyses is the low content of ash. The U. S. P. (IX) standard for ash has been fixed at 0.25 percent: the largest percentages found was 0.066 and 0.04, foreign brands.

ANALYTICAL LABORATORY OF SMITH, KLINE AND FRENCH CO.

## INVERSION OF CANE SUGAR IN SYRUPUS.\*

JOSEPH L. MAYER.

In the February, 1902, issue of the Druggists' Circular (page 27), in an article, "Fallacious Tests for Glucose in Cane Sugar Syrup," I showed that Syrupus made according to the official formula by the hot process did not contain more than a very faint trace of reducing Sugar, but after being stored for five months in a corked bottle which had been placed in a cool, dark place, yielded a very heavy precipitate of Cuprous Oxide when tested with Fehling's Solution, indicating that much of the Cane Sugar had been inverted.

The tests made at that time being qualitative only the thought occurred to me recently to make a series of quantitative tests to determine exactly how much of the Cane Sugar was converted into Reducing Sugar, and the following work was therefore undertaken.

On January 28th, 1915, 1000 cc. of syrupus were made following the directions on page 435 of the U. S. P., VIII, for the cold percolation process and the same day 1000 cc. of syrupus were made by the method on page 435 of the U. S. P., VIII, for the hot process, each sample being placed in a sterilized glass stoppered bottle.

The syrup made by percolation had a specific gravity of 1.3148 at 25 deg. C.,

\* Read before the New York State Pharmaceutical Association, June 29, 1915.

and the sample made by the hot process had a specific gravity of 1.3126 at 25 deg. C.

A quantity of syrup from each bottle was immediately weighed in tared 100 cc. graduated flasks and water added to make 100 cc. and the reducing sugar in 50 cc. of this solution determined by the following method of Walker and Munson:

(1) *Preparation of Solutions and Asbestos.*

(a) *Solutions.*—Use solutions (a), and (b), and (c) as given on page 42, under Soxhlet's modification of Fehling's solution.

(b) *Asbestos.*—Prepare the asbestos, which should be the amphibole variety, by first digesting with 1:3 hydrochloric acid for two or three days. Wash free from acid and digest for a similar period with soda solution, after which treat for a few hours with hot alkaline copper tartrate solution of the strength employed in sugar determination. Then wash the asbestos free from alkali, finally digest with nitric acid for several hours, and after washing free from acid shake with water for use. In preparing the gooch crucible load with a film of asbestos one-fourth inch thick, wash this thoroughly with water to remove fine particles of asbestos; finally wash with alcohol and ether, dry for thirty minutes at 100 deg. C., cool in a desiccator and weigh. It is best to dissolve the cuprous oxide with nitric acid each time after weighing and use the same felts over and over again, as they improve with use.

(2) *Determination.*

Transfer 25 cc. of each of the copper and alkaline tartrate solutions to a 400 cc. Jena or non-sol beaker and add 50 cc. of reducing sugar solution, or if a smaller volume of sugar solution be used, add water to make the final volume 100 cc. Heat the beaker upon an asbestos gauze over a Bunsen burner, so regulate the flame that boiling begins in four minutes, and continue the boiling for exactly two minutes. Keep the beaker covered with a watch-glass throughout the entire time of heating. Without diluting, filter the cuprous oxide at once on an asbestos felt in a porcelain gooch crucible, using suction. Wash the cuprous oxide thoroughly with water at a temperature of about 60 deg. C. then with 10 cc. of alcohol and finally with 10 cc. of ether. Dry for thirty minutes in a water oven at 100 deg. C., cool in a desiccator and weigh as cuprous oxide.

N. B. The number of milligrams of copper reduced by a given amount of reducing sugar differs when sucrose is present and when it is absent. In the tables following the absence of sucrose is assumed except in the two columns under invert sugar, where one for mixtures of invert sugar and sucrose (0.4 gram of total sugar in 50 cc. of solution) and one for invert sugar and sucrose when the 50 cc. of solution contains 2 grams of total sugar are given, in addition to the column for invert sugar alone. (U. S. Dept. of Agr., Bur. of Chem., Bull. 107, rev., page 241 and 242.)

The cold percolation process sample contained .174% invert sugar.

The hot process sample contained .138% invert sugar.

The cane sugar from which the syrups were made was tested by the same method and contained .111% invert sugar, thus indicating that in the process of making the samples very little inversion had taken place.

The syrups were then placed in a cool dark place, samples being taken from them at frequent intervals and tested with the following results:

		Cold	Hot	Invert Sugar
January	28, 1915 (The day the samples were prepared)	.174%	.138%	"
February	10, 1915	.172%	.171%	"
"	25, 1915	.292%	.170%	"
March	9, 1915	.559%	.401%	"
"	23, 1915	1.123%	1.061%	"
April	2, 1915	1.807%	1.595%	"
"	9, 1915	2.029%	1.905%	"
"	15, 1915	2.367%	2.354%	"
May	6, 1915	3.411%	3.566%	"
"	19, 1915	4.978%	4.735%	"
June	3, 1915	6.586%	5.751%	"

These remarkable results not only disprove the statement very frequently made that in making syrups by the hot process much of the sugar is inverted, a statement which my original article above referred to disproved, but they also conclusively show that in making the samples by either the cold or hot process practically no inversion takes place. They show that upon standing the sugar in both samples becomes inverted, the inversion being greater in the cold process syrup than in that where heat is employed in the manufacture.

I am still at work on the samples and hope in my next paper on the subject to report further results of the investigation.

RESEARCH AND ANALYTICAL DEPARTMENT, RIKER LABORATORIES.

## SOME EXPERIENCES WITH THE SALOL-COATING OF PILLS.\*

J. C. AND B. L. DE G. PEACOCK.

The coating of pills with salol in order to render them insoluble in the stomach for the purpose of carrying the medicine into the intestines has been practiced for years past. Methods have been frequently described and one is set forth in the current edition of the National Formulary.

During the past two years salol-coated pills have been frequently called for, and the knack of salol-coating had to be developed by our prescription department. What is about to be said is by no means a discovery, but merely a recitation of experiences in the actual practice of the process, a few simple facts which may help those who are called upon to do this work for the first time.

Two methods of salol-coating have been suggested; first, that of dipping the pills into the melted salol by means of pins and rotating in the air until the salol has solidified, removing the pin when a sufficient coat has been taken on and closing the puncture with a drop of melted salol.

Second, the method in which the pills are placed in a vessel in which salol has been melted, and the vessel rotated until the salol congeals.

The second method is the plan given in the National Formulary.

The first method does not appear to have been as generally used as the second. It is very much more tedious to stick pins into the pills, dip them into the salol

\*Read at the meeting of Pennsylvania Pharmaceutical Association, June, 1915.

and rotate a number of pills at one time, than to place the pills all at once, into a vessel, and rotate.

Besides, the salol sometimes chips off when the pin is withdrawn and the sealing produces an unevenness of coat which is not pleasing to the eye.

The second method is therefore much less tedious, and more rapid; and with a little practice gives excellent results both in the amount of salol applied and in the appearance of finished pill.

The pills which were most frequently ordered to be salol-coated, contained silver nitrate, sometimes with extract of hyoscyamus, and sometimes with opium.

The mass should be hard in order to get the best result. It is also desirable to have pills as nearly round as possible. The usual dusting powders can be applied, and while it is best not to leave more of this adhering than is necessary, the slight amount which may be needed in some cases is not objectionable. The size of the pill does not matter, although as in almost all pill work, a pill of one grain weight is easier to manipulate than a smaller one. In the experiments made, mass was added to the very small pills; powdered licorice root, kaolin, tale and confection of rose were used with good results.

The National Formulary (III) page 122, Section 2, enteric pill-coating, paragraph b, Salol-Coating, reads as follows:

"The pills, carefully freed from dusting powder are dropped into a capsule containing enough salol (approximately 0.06 gm., (1 grain) to every 0.8 gm., (3 grains), pill), previously melted by the heat of a water bath and allowed to cool so that by passing the hand along the bottom of the dish there is scarcely any warmth felt, and the capsule is then rotated until the pills are coated and the salol has congealed. The process is repeated twice, each time reducing the salol about one-half. Finally a finishing coat is applied by using only sufficient salol to coat the dish when melted; the dish being now kept quite warm (almost hot), the pills rotated quite rapidly until they are quite shiny, then turned into a cool dish, and the rotation continued until the pills are cool."

This plan was followed to the letter in the first several attempts which were made. The results, however, were not satisfactory, mainly because an insufficient quantity of salol is ordered for the first three treatments. Further, the use of more heat in the fourth treatment is very likely, in fact almost certain, to melt off some of the salol; and again, transferring to a cool dish produces uneven or irregular coating due to a too sudden reduction of temperature.

It was therefore found better to take more salol with which to start the treatment, and also, as nearly as possible, to use the same temperature in all the treatments. After a number of experiments, the following plan was worked out and has been used with constant success by a number of operators.

One of the most important details from the standpoint of practice is the selection of the vessel in which to do the coating.

Concave capsules and similar shaped vessels are not well suited because the pills tend to roll out during the rotation of the vessel, or at least get to some extent out of contact with the melted salol.

Flat bottom vessels with flaring sides are better suited because the pills are not so likely to be thrown away from the salol during rotation. But there is still the chance of the pills flying over the flaring sides. The vessel which ap-

pears to be best suited is a flat-bottomed, white enamel pan, with perpendicular sides; a handle gives additional convenience to this vessel; a size convenient for coating 24 to 30 pills is about 4 inches in diameter by about  $1\frac{3}{4}$  inches deep. The inner surface should be smooth. The material of this vessel seems well adapted to the gradual cooling of the salol, a feature which is essential to success.

The perpendicular sides of this vessel prevent the pills from flying out, and the flat bottom keeps the pills in constant contact with the salol.

For 24 pills of 1 grain each, twenty grains of salol were usually found to be sufficient for the first three applications, and for the fourth and final treatment about seven grains additional were required.

The vessel having been decided upon, the proportionate amount of salol is placed in it then warmed over a flame (a water bath is not needed), just sufficiently to melt the salol, and the liquefied salol flowed over the bottom and into the angle of the vessel. The temperature is now allowed to fall until the salol is nearly ready to solidify, at this point the pills are placed in the vessel which is immediately rotated to prevent the pills from sticking together either from capillarity through melted salol on neighboring pills, or from sudden reduction of temperature, congealing the salol on the pills.

A thump against a block or the hand will separate pills when rotation alone does not.

Rocking the vessel at an angle will also keep the pills separated and in motion well suited to proper coating. The pills must not be rotated too rapidly, even in the flat bottomed dish with perpendicular sides, as the centrifugal force may throw the pills against the wall of the dish and out of contact with the salol.

Resting the vessel upon the counter or the hand during rotation, and using just enough rotation to keep the pills separated, gives the best results. The vessel should be rotated or rocked until free from sensible heat. The pills are then turned into a box. The coat of salol taken on in the first treatment will not usually mask the color of a black pill.

For the second treatment the dish is again heated, just sufficiently to melt the salol remaining; when it has cooled to some extent, the salol still liquid, the pills are put back into it, and rotated as before until cold. The second treatment will show a decided change in appearance.

A third application of salol is made in the same manner. This treatment appreciably increases the shell of salol.

For the fourth coating it is necessary to supply more salol, usually about one-third of the original amount taken, it being added to whatever remains in the vessel. For the fourth and final coating the vessel does not need to be made any warmer than for the first three coatings, nor is it necessary to transfer the pills to another dish as suggested by the National Formulary.

The rough uneven appearance of the coating that may be met with in one's first efforts can be repaired by heating sufficiently to melt off all the salol, and then resorting to proper conditions. This rough appearance is usually due either to insufficient salol or to a sudden drop in the temperature of the melted salol. Should the partly coated pills be thrown into a vessel that is too hot, the salol will be melted at the point of contact and the pills show unevenness when salol

has been lost or even bare spots. To remedy this appearance, melt off all the salol and return to the conditions outlined.

As to the number of pills that can be coated in a vessel of given size from twenty to thirty can be conveniently done in the one described. Even fifty can be done in this vessel, but experience will be needed; for fifty or more pills a larger dish should be provided, or the lot divided for treatment.

To indicate the wide scope of possibilities in salol-coating, pills which had been massed with petrolatum have been coated.<sup>1</sup> Gelatin capsules are also ordered to be salol-coated. This can be done by the same method. Even hard capsules containing liquids such as creosote can be coated by first placing the capsule inside of a slightly larger one.<sup>1</sup> Soft elastic capsules may also be enveloped in salol as the sample shows.

---

A. MEDLEY.\*

---

GEORGE M. BERINGER, JR., P. D.

---

Few men have so many problems and difficulties presented to them in their daily work as does the pharmacist. Accidents happen, preparations go wrong, materials are spoiled or rendered unfit for further use, by what, to the casual observer would seem the sheer perversity of the things themselves. To him who yields without struggle to such conditions, life is but "an empty dream." To him who, by the application of some almost insignificant bit of knowledge, conquers them, there comes the wild joy of wresting from an apparent defeat, an assured victory.

An illustration is furnished by a happening of a few months ago. A barrel of potassium bicarbonate, of German manufacture, had been on hand for some time. It was lined with parchmentized paper. Through some defect in the manufacture of the paper or the action of the salt upon it, the paper began to dis-integrate. The more one tried to separate the salt and the paper the more they mixed. A boy was put to work spreading it on a table and picking out the bits of paper. It looked all right, but the first pound sent out was returned in a hurry. The paper was still there.

With the facilities at hand, recrystallization was out of the question, but nearly 200 pounds of material could not be wasted, especially, in the face of a rising market. Then came the magic inspiration of the electric fan. A small fan was set awlirl at one end of a long, narrow table. The table was covered with clean, heavy paper, and, along the edges was placed a row of wooden boxes to prevent the potassium bicarbonate from rolling to the floor. The end was left open.

Through the swift current of air, passing along this narrow channel, the material was allowed to drop, a handful at a time. Away went the paper—big bits and little bits—in a merry whirl, while the heavy chemical—bright and clean—dropped on the table—freed from its troublesome companion. Scarcely a pound of material was lost.

<sup>1</sup> Samples were shown.

\*Read at the meeting of the New Jersey Pharmaceutical Association, June, 1915.

## CLEANING CAPSULES.

How do you clean capsules after you have filled them with powdered material? Do you wipe them on the towel at the prescription counter? Whether that towel is clean or otherwise? Well, don't confess what you do—just try this. Take a piece of absorbent gauze of such size that it can be folded into a square of eight or ten inches, having four thicknesses of material. Place the capsules to be cleaned in the center of this. Gather up the corners and edges of the gauze into one hand, in such a manner that the capsules are suspended in a loose bag. Now rub this bag across the palm of the other hand a few times, pressing firmly. Each capsule is rubbed between the layers of gauze, and every particle of powder is removed, leaving it bright and clean.

## GRANULATING.

You are in a hurry for some camphorated oil. You crush the camphor into coarse lumps, and throw it into the oil, put the mixture on a water-bath for an hour or so, and return to find lumps of camphor still in evidence. Then, if you are of that temperament, there follow a few splutters, dashes, blanks and exclamation points, but the camphorated oil is still unfinished. Before you try it again, go to your hardware dealer and spend from 75 cents to \$1.25 for an almond grater. Put your camphor into this machine, a few lumps at a time, turn the handle, and have the camphor in an almost uniformly fine granule. Add this to your oil. Put it on the water-bath and have your preparation—less the dashes, etc., in fifteen minutes.

Speaking of the almond grater, you will be surprised at the number of uses you will find for it. You can granulate castile soap for making soap liniment. You can granulate opium, if you make preparations of that drug. And you can granulate almonds and make your almond meal from real almonds.

## SAMPLING NIPPLES.

Take a smooth piece of wood of convenient length—about one-half inch thick and six inches or more wide. Sand paper this perfectly smooth and mark off points one and one-half inches apart each way to the same number as you have styles of nipples. Attach three-fourths inch, or any convenient size, wooden button moulds, which you can obtain at any store dealing in dress making goods, at each point, by means of small brass screws, and over each peg, thus formed, a nipple is stretched. For larger nipples, like Hygeia, use the top of turned wood boxes of convenient size, with a hole drilled through the middle. For smaller sizes like the Maw style, use large round-headed brass screws. The nipples can be arranged on the stock selves in the same order as on the display board described. If so desired, a small label can be put on the board in front of each nipple, giving the name of that particular style, or its number, so that one can be picked from the proper box without disarranging the rest of the stock. The nipples should not be sold directly from the display board, but should be changed at frequent intervals so as to keep them in good condition.

## SUBSTITUTE FORMULAS FOR SPECIALTIES.

---

 OTTO RAUBENHEIMER, PHAR. D.
 

---

The substitution of one drug for another has been practiced from the earliest times. Was it not Claudius Galenus, the great Roman physician-pharmacist, who was about the very first to prepare a lengthy list of drugs, "Quid pro quo," a list which remained in use until about the Sixteenth Century.

Even at the present time the manufacturing chemists and the retail pharmacists are advocating the substitution of sodium salts in place of potassium salts, owing to the fact that the latter are quite scarce and much more expensive on account of the European war. In connection with this it should also be remembered that sodium salts possess two further advantages over potassium salts, namely, that they are more soluble and have a smaller molecular weight.

So much for drugs and chemicals, that is, their substitutes. How about preparations? How about substitutes for some of the proprietary preparations or specialties? It is needless to point out that the two standards in pharmacy, the U. S. P. and N. F. contain such substitutes. It is for this reason that on numerous occasions both of these works have been severely criticized. Personally, the writer has always held the opinion that it was perfectly legitimate and proper for the pharmacist to manufacture such so-called substitutes, providing, however, he sells these upon their merit and does *not* dispense same when the proprietary preparations or specialties are called for. Let it be thoroughly understood that the writer does *not* advocate the substitution of such preparations in place of the proprietary articles!

On several occasions and again at the Nashville Convention of the A. Ph. A., I had the privilege to present a copy of the Formulary of Pharmaceutical Specialties published by the Luxemburger Apothekerverein. This little formulary gives a great many formulas for specialties from Germany, France, and even the United States. The Latin titles are followed by the name of the specialty, for instance, Linimentum Capsiei Compositum (Pain Expeller), Emulsio Olei Jecoris Aselli (Scott's Emulsion), Antipyreticum Americanum (Antikamnia), and last, but not least, Bromidia (Bromidia Battle). This may serve as an illustration what the Luxemburg Apothecaries' Society is doing.

The writer has just received from the Deutscher Apotheke-Verein, Berlin, a copy of a booklet having the title "Sammlung von Vorschriften fuer Zubereitungen zum Ersatz von Spezialitäten des Feindlichen Auslandes," which translated into English means, "Collection of Formulas for Substitute-Preparations of Specialties from Belligerent Countries."

The preface of the book tells us that owing to the existing conditions of war, these foreign specialties are partly unobtainable and should *by all means* be replaced by substitutes which the German apothecary can very easily prepare himself.

It is needless to say that principally French and British proprietary preparations are dealt with, for instance.

Capsules Guyot, Cascarine Leprince, Eau dentifrice du Dr. Pierre, Liqueur anti-goutteuse de Laville, Capsules Pautauberge, Grains de sante du Dr. Franck, Injection Brou, Pilules de Blancard, Quina Laroche, Sirop d'Aubergier, Sirop de Dusart, Vin de Dusart, etc., etc.

Bishops Citrate of Lithia, Easton's Syrup, Eno's Fruit Salt, Roche's Embrocation, Beecham's Pills, Calvert's Carbohc Tooth Powder and Paste, Elliman's Embrocation, Hazeline-Cream, Hazeline Snow, Morison's Pills, Pink Pills, etc., etc.

I find that about one half a page is devoted to Browne's Chlorodyne, and it is claimed that the formula given is the original one which has been supplied from a British source through apothecary Mandowsky of Hamburg.

Another interesting feature of this booklet is that there are two and a half pages of specialties which are arranged in a table, in case they merely consist of one ingredient, as f. i., Santal Midy=Caps. gelat. Ol. Santali 0.3 Gm.

The writer, as chairman of the Committee on Recipe Book of the A. Ph. A., was indeed pleased to receive this Formulary, which no doubt will come in very handy in the compilation of formulas. This little book will no doubt convince us of the proverbial German ingenuity and may well serve as an example to American pharmacy and to the American Pharmaceutical Association.

THE COLLEGE OF PHARMACY, JERSEY CITY, June 21st, 1915.

---

## MODERN BUSINESS METHODS FOR PHARMACY.\*

---

E. FULLERTON COOK, P. D.

---

Notwithstanding the many signs to the contrary, pharmacy retains today many features which are distinctly professional, although the commercial side is rapidly increasing in importance. The desire on the part of pharmacists in the past, to maintain ideals which they termed "professional" has largely been responsible for failure to apply proper methods to the drug business, and we face today a condition in some stores where the commercial side or the merchandising end of the business is entirely eclipsing anything of a professional character; yet in other localities there are many signs which indicate that professional pharmacy is coming into its own and is advancing to a point never dreamed of in the past. It is quite safe to predict that the future will more sharply draw the line of demarcation between the so-called commercial pharmacy where merchandising is given almost exclusive consideration, and the store or laboratory where the emphasis is constantly placed upon professional activities and scientific work. Even though this condition is true, it nevertheless remains as a necessity of modern business that both types of pharmacists, if they would continue to exist, must understand and adopt methods in the conduct of their business which insure a profit. Now, these methods do not differ materially in

---

\* Read at meeting Delaware Pharmaceutical Association, 1915.

principle whether they are applied to the most ethical professional man in his relation to his patrons or whether they are enforced by the highly departmentized and commercialized drug store.

A recent article in one of the largest national weeklies described, in an exaggerated form, the condition which exists in pharmacy today. The successful old-time druggist, many years in business, learns of the anticipated opening in his neighborhood, of a so-called "chain" drug store, conducted by a corporation and managed on the most approved and modern business principles. According to the story, he immediately retires from business, feeling that he was incapable of successfully competing with such methods, and, in talking with his friend, predicts the failure of all of the other older stores in the town, very shrewdly saying that, "The only possible hope for successful competition with stores of this new type is to adopt all of the methods which they are successfully using, and do it first, and a little better." This is doubtless an extreme view, because a successful pharmacist in a neighborhood should have an invaluable asset in the confidence which the community places in him, and because of his personal relations with patrons, and yet, the suggestion to learn modern methods, and immediately introduce them into your own business is the best possible advice and is worthy of the most earnest consideration. It is the intention here to briefly outline some of the principles which are being advocated today for successful business.

The keynote and business text, which should be foremost in thought, continuously emphasized and always be a guiding motive, is *service* to the customer. The adoption of this principle by the proprietor and his clerks will answer many petty problems which arise, and insures at once the proper attitude toward customers. Someone has said, "Love your customers, for out of them are the issues of business life," and this is but another way of expressing *service*.

A second essential, equally important, which must not be lost sight of by a business man, is the assurance that a *profit* is forthcoming. In other words, the two parties to the transaction: he who receives the service, and he who renders the service must both receive value or the transaction is not ideal.

In order to insure service and a profit there must be intelligent management in a business. The proprietor or manager should not be concerned too closely with the more minute routine or detail. He should have time to study the entire field of operation and be able to lay his campaign with every branch of the service before him, and with an intimate knowledge of every factor. Roughly stated, the business should be before this executive head in the following four divisions: *Purchases, Sales, Expenses and Profits*. These four departments are interdependent and all essential; and each requires a special study and control in its relation to the others.

*Purchases*: This branch of the business is its very backbone. Facing aggressive competition, the merchant knows that if he would sell at a price which will appeal to the intelligent customer and yet make a profit for himself, he must buy goods at the right figure. The goods sold must be of a quality which the trade demands and the price one which will enable him to meet competition and yet make a profit. This means, *first*, an intimate knowledge of the demands of the community. *Second*, the value and variety of goods offered and the best and cheapest market in which to buy. *Third*, a close watch upon stock so that over-

stocking is avoided and yet sales not missed by being "just out." Over-buying is a serious menace to profits since a turn-over of stock six times a year requires half as much capital as a turn-over three times a year. *Fourth*, in the purchase of goods the important point of taking discounts for prompt payment must not be overlooked. If this is done even semi-monthly and the discount is only 1 percent it means 24 percent interest on the money thus invested. In addition to this, the discounting of bills insures a relation with the wholesale house which gives the business man many favors in the way of bargains and special prices. This business custom also establishes a type of credit which is from one standpoint very desirable; and lastly, but not least, the discounting of bills relieves the proprietor of the worry about unpaid accounts and large bills coming due, the worry from which would often incapacitate him for handling the many store problems which arise.

*Sales:* Under this head the proprietor of a store must consider every means by which increased sales can be secured. Goods which have laid upon the shelf longer than sixty days become a serious menace to the profit account since it means stock and capital tied up and not working. How can this be stimulated? The man who simply waits until a customer comes into the store because he happens to be passing that way will soon find that someone else has not waited for the "just happen tendency," but has drawn to his own store by good advertising that prospective customer of yours who "might" have come your way. Sales must be stimulated by legitimate advertising methods but do not forget, again, that the customer must receive *service* and be pleased by his purchase. If this does not follow, it were better that the sale had not been made. No more difficult handicap can be imagined than dissatisfied customers and, on the contrary, no better advertising can be secured than through pleased and satisfied customers. Advertisement is the steam, driving many a large business to success, but it must be carefully applied. Probably the best and at least the first advertisement that every drug store should strive to offer is a clean and attractive store, served by neatly dressed, courteous and competent clerks. No amount of other forms of advertising will be worth while if the customer does not find in the store the attractive feature described i. e., prompt and efficient service.

The store, itself, should be arranged so that suggestive salesmanship can be stimulated to the highest degree. For instance, all preparations which relate to the treatment of the teeth should be attractively grouped so that when a customer buys a tooth-brush it will be possible for the clerk to ask, in a proper way: "Have you ever tried this mouth wash, which we are specially recommending?" or a tooth-paste of exceptional merit may be referred to, etc. Other allied toilet articles or general merchandise which lend themselves to suggestive salesmanship should be grouped.

Needless to say, proper attention should be given to window decorations and a part of the money set aside for advertising should be used in making these attractive. It would be wise to make it the duty of one of the clerks to study up ideas for the windows and, under proper direction, do the decorating. Frequently, one clerk will be found peculiarly qualified to do this.

Other forms of advertising should also be conducted from time to time. Newspapers, trolley advertising, small monthly papers, circulars, samples, premiums,

etc., etc., as may be best adapted to the particular business. A specific sum should be appropriated each year for advertising and expended in ways which bring the best results. Sometimes a remodeling of departments, new prescription equipment, new cases, increased soda water facilities, etc., may be the best form of advertising for that particular time. It has been frequently stated that at least 2 percent of the total sales should be used in advertising in order that a business may be maintained at its present standard and at least slightly increased.

One feature which is often neglected in a drug store is the proper training of the clerks. The proprietor or manager should develop friendly relations with the clerks and gain their confidence. It is only by coöperation, by training the clerks in salesmanship as well as the technical side of the business and by drawing out ideas from them, that a sales force with anything like maximum capacity can be developed. Rewards should be offered for the best ideas and merit acknowledged where it is found.

*Expenses:* This part of the business deserves equal attention. The best laid plans for purchases and sales may go for naught if expenses are not maintained in proper proportion. The store is compelled to have certain fixed charges. As a rule these should not exceed 25 percent of the average selling price of the goods. If the expenses are a larger percentage than this in relation to total sales the manager faces two possible remedies. First, some expenses may be reduced or entirely eliminated. Secondly, if the expenses are essential then the volume of sales must be increased so that the percentage of expenses will be brought within that which is legitimate. Every expense should be carefully recorded and then critically analyzed. Often, all expenses of the business are not recognized. Probably one of the most frequent failures to accord an expense in the drug business is the salary of the proprietor. As proof that this must be considered an expense, it is only necessary to recognize that the proprietor without assuming the responsibilities or risks of business could receive elsewhere an equivalent salary, and as still further evidence it will be recognized that if he were sick or compelled to be absent, another man would have to take his place, and that salary charged as an expense of the business. Another item which is sometimes overlooked is rent for the store room when the property is owned by the proprietor. Again, recognize that if you did not occupy the room some other business house would be paying you rent and so your business occupying the building should also be charged with rent before a real profit is secured. Therefore, rent, light, heat, salaries, (including proprietor's), office expenses, (such as bill heads, letter heads, envelopes, postage stamps, account books, etc.), telephone expense, advertising, breakage and interest on borrowed money, licenses, drayage, etc., must all be taken into account in summing up the total expense. It is often possible when a man has been in business for several years to estimate what these expenses should be, and establish a budget at the beginning of the year; if this is exceeded in any one month the cause can be ascertained and the leak stopped. The chain stores have worked this out very carefully and if any store exceeds the estimated expense, say for light in one month, the manager must explain why. The importance of this is evidenced by the fact that net profits are often based upon only 5 percent of the sales, and if the expense has been planned at 25 percent and in reality, through carelessness, reaches 30 percent, the entire profit is wiped out.

*Profits:* As was stated at the beginning, a profit as a result of business is absolutely essential; otherwise, the business is a failure. How can this be insured? It is only possible through the establishment of a system for pricing goods and then working the system through the aid of accurate accounting. The vast majority of druggists in the past knew practically nothing about modern accounting. They were so overwhelmed by the daily routine and detail that no time was left for this important aid to success and the result only too often was "no profit" at the end of a year of laborious and exacting work. It is far better to devote a little more time to accounting so that the business is handled intelligently and a profit insured than to do a large business and find at the end of the year or five years of hard work that instead of a profit the result is bankruptcy. It seems hard to impress this fact upon many druggists but it is one of the things which the introduction of chain stores is compelling every business man to recognize, and this very fact will be a blessing in disguise to the pharmacist of the future.

Another point which has not been thoroughly appreciated is the fact that the Internal Revenue Department of the United States Government is checking up more and more closely those who should pay the income tax. The pharmacist who is conducting a properous looking business may at any time be asked to give an accurate accounting and failing to do so correctly, face the possibility of a heavy fine.

A system for pricing which will insure a profit if properly carried out was recently suggested by Mr. Liggett, of the United Drug Company. This outline may not be adapted to every business because as the amount of professional work, including prescription filling, increases, the first cost of goods decreases and the clerk hire increases, but it serves well to illustrate the point. It is as follows:

Assuming that the sales are \$300.00 a month, and stating all percents as percent of the total sales, then:

Total sales .....	\$3000.00	100	per cent
First cost of goods.....	2000.00	66 $\frac{2}{3}$	per cent
Gross profit .....	\$1000.00	33 $\frac{1}{3}$	per cent

From this \$1000.00 must now be paid all expenses, and from it must also come the net profit, if any is to be made. It should be divided about as follows:

Rent, heat and light.....	\$210.00	7	per cent
(the only fixed charges)			
Clerk hire .....	360.00	12	per cent
Advertising .....	60.00	2	per cent
All other expenses.....	120.00	4	per cent
Net profit .....	250.00	* 8 $\frac{1}{3}$	per cent
	\$1000.00	33 $\frac{1}{3}$	per cent

Finally, without giving extensive detail, accurate accounting is a prime essential and at least three divisions are desirable for a store where the proprietor must keep the books. First, a loose-leaf ledger plan whereby the customer's credit accounts are properly handled; second, a satisfactory Stock Record with accompanying facilities for taking an annual inventory; and third, a complete record of every transaction connected with the business in some concise and yet efficient form.

## Editorial

E. G. EBERLE, Editor.....63 Clinton Building, Columbus, Ohio

### I WILL!

CATO for many years closed his address with a never changing charge that "Carthage must be destroyed" until the thought and determination became firmly fixed in the mind of every Roman.

The American Pharmaceutical Association endeavors always to be constructive and with the purpose of being of increasing service to pharmacy, persistently solicits accession of membership. A new year is beginning, for the annual meetings of the Association correspond to the commencement exercises of schools, and the best way to make resolutions effective, is not to procrastinate in the resolve. Every member of the A. Ph. A. must realize that he could each year have his name signed to at least one application for membership, if he was possessed with "that something" which activates the "I Will!" There are some who never permit a year to pass without one or more applications to their credit, why not everyone? The best time is Now. Place a card with the pre-scription "I Will!" on your desk and fill it.

An organization is representative of those who compose the membership and the progress of the association is a corollary to individual improvement. The progress of an association is thought in action. Gather individuals into an organization and assign to them a strict course of procedure from which they must not deviate and stagnation will soon result.

The American Pharmaceutical Association has an enviable history but its continuing strength is in the members who work for to-morrow instead of to-day, who try to find new ways and better ways for doing the work they are doing now, constantly improving the methods they are using and imbued with the spirit of altruism that has always characterized the Association.

### LOOKING FORWARD.

AN editorial in a recent number of the Pharmaceutical Journal and Pharmacist brings to our attention that English pharmacy and pharmacists have very much the same problems to solve that engage us. So close indeed is the relation that it would be quite easy to adapt the editorial referred to for the Journal of the A. Ph. A. by simply using the designations and terms applied in this country.

The editorial presents that there are no fixtures in the universe of change—no oases of finality in the ceaseless struggle for principles and the deduction is made that no sooner is one set of adverse circumstances resolutely grappled with and overcome, than another, and perhaps more formidable series is generated on the debris of vanquished evils. Then various legislative actions are cited and the esti-

mate of the legislators is stated in very similar verbiage of dicta employed by us. We, evidently, are no more nor less reluctant to allow the full educative influence of the knowledge of perpetual succession of trouble in ever-changing guise, to direct our action by studied and systematic methods. We may theorize, criticize and even plan, but here our activity all too frequently ends.

A reorganization of the House of Delegates is contemplated and it is to be hoped that the great possibilities of such a body will be developed into deeds of usefulness. There are many opportunities for rendering service to pharmacy, but in utilizing these, the first essential should be a very lucid understanding of the promotions contemplated. "What are we here for?" is just as relevant a question in pharmaceutical as in political conventions.

We will not anticipate the program of action: this much however may be said, every pharmacist is concerned in the shaping of the future of his calling and should not withhold his voice from the counsels of the state associations so that the promotions of the House of Delegates may be co-operative. Every one of the state organizations should provide for systematic discussions of policies that may be adopted or endorsed and the respective state associations should see to it that every pharmacist, whether member or not, has an opportunity of participating in the consideration.

Legislation pertaining to pharmacy will doubtless have first attention. Just a few thoughts are offered: A thorough understanding of the motives which prompt legislation regulating pharmacy is necessary. Legislators are more easily persuaded by their constituents than any arguments that committees of pharmacists may present. Pharmacists are seldom represented in legislative bodies and few of the members have a knowledge of pharmaceutical needs, still they are usually very reluctant to accept of expert advice.

These statements suggest that means should be provided in advance, for enlightening those who legislate and more particularly to outline a plan of procedure and not become dependent on evolving a course of action on the spur of the critical moment and without the possibility of consultation. Whatever legislation is necessary should be carefully outlined, each measure drafted into a bill ready for action, and arguments for its support should at the same time be prepared, as few laws are enacted without a contest somewhere. Pharmacists should realize the necessity of having representation from among their own number, not only in state legislative bodies, but also in Congress. In the adoption of legislative proposals, uniformity should always receive most thoughtful consideration as well as the enactment of sane legislation.

## THE JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

PREFERENCE is still shown by some members of the Association for the former annual volume, others are advocating a semi-monthly publication. These are the extremes, with a growing preference for the latter. Many others would take this view if the Association received sufficient income, permitting of the issuance of a semi-monthly Journal, for with a monthly publication there is of

necessity a delay in printing some of the papers, read at the annual meeting, and this does not always do justice to the contributors.

It is hoped that the membership of the Association will increase numerically and provide larger revenue; the suggestion made by some that the annual dues be doubled would certainly not be conducive to the growth of the Association. There is only one other source of revenue and this is the advertising in the Journal. There are many who do not now patronize the Journal, whose advertising would be acceptable. It is somewhat strange that manufacturers of apparatus, appliances, prescription ware and even of supplies for manufacturing pharmaceuticals, have not availed themselves of the opportunity the Journal offers in reaching a class of patrons, who are extensive buyers of these goods. Members will lend a helping hand, if they will bear this in mind when making purchases.

The Journal does not seek to become a competitor of trade journals, its field for securing advertisers is circumscribed, neither is it contemplated to bring other pressure to bear than the persuasion that patronage from the manufacturers will produce business for them.

While the suggestion for a semi-monthly publication has been carefully considered, a conservative view ought to be taken and a larger source of income be developed before incurring the greater expense that would obtain. The only production costs that would not relatively be increased are those of the office and editor.

The suggestion has been made also that the proceedings of the Association be not published in full, but more or less in abstracted form. It is extremely doubtful whether this is advisable. It is a difficult matter to condense the minutes of the convention and do everyone justice, or perhaps, better, in every instance give the thoughts that were intended by members participating in debate. The original minutes are always preserved for reference in case of dispute, but such a radical change seems very impracticable, if not dangerous. Some of the more lengthy discussions are now abbreviated, but only by excision of the less important remarks or duplicated statements.

When the present editor took charge of the Journal, he asked for suggestions, as to how the publication could be made of greater service, more interesting and valuable to the members. This invitation is now repeated; every member is asked to look upon the Journal as his and her publication and such personal interest should persuade them to assist in its production and promotion. The value of the Journal is realized now, and by thoughtful and careful co-operation it will become the strong incentive for enlisting many in the Association who are not members at the present time.

We know the membership of the American Pharmaceutical Association too well to permit of other conclusions than that the Association will become still more influential as a factor in American pharmacy and at no time in its history has the opportunity for development been greater. Some of the members are perhaps too theoretical, others somewhat impatient, but the Association maintains an equilibrium, while making safe and steady progress. The Journal subserves the Association and follows its dictates.

## PAPERS.

LAST year the General Secretary was authorized, if he deemed advisable, to have papers printed in advance of the meeting. The only reason for not doing so this year was that the papers did not reach the chairmen in time. Members returning from the annual meeting find work waiting their attention, thereafter business matters interfere until the approach of next convention compels them to give time to the preparation of papers. Again, a late day has developed a subject of importance, and so most of the excuses are not make-shifts, but embody good and sufficient reasons for delay. When members have papers in preparation that they think should be printed in advance of the meeting, so that reprints may be placed in the hands of members in convention, such possibility will be promoted by sending them to the chairmen of the Sections, early enough to be edited and revised, if necessary.

Every paper should be accompanied by a brief abstract. This will assist the members in following the author in his presentation of the paper and should the editor desire to use all or part of it as an introductory to the article, the statements of the writer will be correctly interpreted.

Some articles are unnecessarily lengthy, frequently the only object of many lines is to embellish, occasionally there is needless repetition. This is a subject that concerns the reader and constitutes one of the trials of the editor. The judgment of the latter is not infallible but it may be taken for granted that he tries to show deference to the contributors. Notwithstanding this, a very creditable paper may not be available for use in the Journal, for no other reason than that the story might have been told in one-fourth the number of words and with better effect. This has no reference whatever to articles that would lose their value by abbreviation and thereby do the writer an injustice. Another class of lengthy papers in the acceptance or non-acceptance of which the editor may have an unpleasant experience, are those that can hardly be condensed and only interest a very limited number. And still another trial comes when a number of papers on the same subject, with comparatively slight differences are submitted about the same time. These are a few of the difficulties that should persuade writers to be more or less considerate in their judgment of the acts of the editor.

## WHAT IS A DRACHM?

IN a paper presented at the recent meeting of the Pennsylvania Pharmaceutical Association, and under above caption, Professor J. W. Sturmer takes issue with Doctor C. L. Alsberg anent his ruling that the designation, dram, shall be taken to refer to 1-16 of an avoirdupois ounce, or 27.34 grains.

No dvantage can possibly be gained by this ruling; 1-16 ounce is very infrequently used in commerce. Doctor Alsberg evidently did not consult those who are most interested and has certainly created an opportunity for confusion. The term, dram, is frequently mis-applied for 1-8 ounce; manufacturers make use of the latter designation for such fractional part of an avoirdupois ounce.

A ruling which would define the value of the weight-term, dram, as of sixty grains would be acceptable, first, it would do away with that denomination in the avoirdupois system of weights and secondly, there is every reason for simplifying the spelling of the word. The "ch" is not pronounced in English usage and for the Latin name, the translation would be just as proper as that of any other title or term. This then brings on the further thought that the use of the official English names in prescription writing is quite as convenient, just as definite and the chances are prescriptions would be more correctly written.

The unit of weight of the metric system is written both gram and gramme. The reason has been assigned, aside from the origin of the word, that gram, in writing, may be mistaken for grain and hence the spelling, *gramme*, is a safe-guard. Doubtless this is true, but except in print the word gramme is seldom given in full.

The change from cubic centimeter to milliliter should be acceptable and it is hoped physicians will drop the denomination "c.c." and write instead "mil." True it is that "mil" is a coined word, but of such is language. While the values of weights are based on measurements, the denominations of the different systems should not have similar names.

It is hoped that the American Pharmaceutical Association will approve the change from cubic centimeter to mil, and disapprove of the ruling made by Doctor Alsberg, and urge that instead, the value of a dram be fixed at sixty grains. Pharmacists ought to have established this valuation long ago by adopting *dram* as the English for the Latin, *drachma*. The Century Dictionary defines the word *dram* and refers the reader to this definition for the meaning of *drachm*, hence clearly expresses the preference of this authority.

E. G. EBERLE.

## THE NUMBER AND KIND OF DRUG ADDICTS.\*

---

M. I. WILBERT.

---

In recent years social workers, reformers and newspaper writers generally have vied with each other in the presentation of startling data regarding the number and kind of drug addicts in this country. In doing so they have established the general impression that those engaged in the various branches of medicine and particularly those engaged in the practice of pharmacy, have been delinquent in that they have failed to safeguard the sale and distribution of habit-forming drugs with the care that properly should have been exercised.

Among the statements frequently met with in current papers and periodicals the following are representative:

"More than two percent of the people of this country are addicted to the use of opium and cocaine, and this number is being augmented at the rate of 100,000 a year."

"Fully 90 percent of the opium we import is used for illegitimate purposes."

"For every ounce of cocaine employed legitimately there are 200 ounces consumed illegitimately."

"Physicians are responsible for at least 95 percent of the habitual users of opium, its compounds and alkaloidal salts."

"More dope fiends have been created by the refilling of prescriptions than in any other way."

"At least 10 percent of the 45,000 drug stores in the country exist largely upon the illegitimate sale of habit-forming drugs."

"Many of the proprietary remedies sold to the laity contain a sufficient amount of dope to develop and to maintain a drug habit."

"The use of heroin as a 'kicker' in patent medicines is comparatively common."

"The Harrison law, excellent so far as it goes, is effectively negated by the exceptions included in Section 6. The most exacting dope fiend could not ask for a larger hole in the law. If he can get an unlimited amount of his favorite drug in a nostrum form anything else that the Harrison or any other law may or may not provide is a matter of indifference to him."

As has been pointed out before (P. H. Rep., 1914, v. 29, p. 3180) some, at least of these statements are not based on reliable data, while others, having the elements of truth, are misleading either because of their incompleteness or because of the partial misstatement of fact. While it is unfortunately true that the number of drug addicts in the United States is disgracefully large it does not, and of necessity cannot even approximate the maximum that has been stated.

Practically all of the opium and coca used in this country is imported through legitimate channels, and because of the comparatively high import tax considerable care is exercised to insure the reporting and recording of all of the products

---

\* Read at meeting of Pennsylvania Pharmaceutical Association, 1915.

at our disposal so that we have fairly reliable data on which to base an estimate of the amount of either drug that is available for all purposes.

Converting the recorded quantities of the several drugs imported into average doses, as presented in the *Pharmacopœia* of the United States, we find that for some years the total amount of these drugs imported has been fairly uniform and will aggregate an average of approximately 2,500,000,000 doses of opium, its derivatives and alkaloids, and 325,000,000 doses of coca leaves and cocaine. These figures serve to definitely fix the amount of available material and quite regardless of the proportion of the several drugs that may be used legitimately or illegitimately the sum total of illegitimate use cannot well exceed the sum total of the available material.

A rather interesting source of information regarding the actual number and kind of drug addicts is available through the enforcement of the Tennessee anti-narcotic law of 1913. Lucius P. Brown, the State Food and Drugs Commissioner of Tennessee, in a recent report (*Am. J. Public Health*, 1915, v. 5, p. 323-333), says that after twelve months of operation there were registered in the State of Tennessee under the provisions of the anti-narcotic law 2,370 persons of all ages and years. These included 784 or 33.1 percent males and 1,586 or 66.9 percent females.

The average consumption per day of the morphine addicts was 8.5 grains or approximately 1000 doses each month or 12,000 doses a year. The State of Tennessee contains slightly more than 2 percent of the total population of the United States and on the supposition that the same ratio of addicts and the amount of material consumed will hold good throughout the country we would have a total of something more than 118,000 drug habitués consuming approximately 1,416,000,000 average doses per year.

Granting the somewhat improbable assertion that 90 percent of the opium imported is used illegitimately at the rate that it is said to be consumed in the State of Tennessee we could have, as a maximum, not more than 187,000 users of opium, its derivatives and alkaloids, in all parts of the United States.

In regard to the use of cocaine a recent authority asserts that one ounce of cocaine is enough to keep 50 fiends thoroughly well doped for a week, or in other words, that one ounce of cocaine is enough to keep 1 fiend thoroughly well doped for a year.

Granting that all of the available 150,000 ounces of cocaine were used illegitimately there could be at this rate a total of 150,000 cocaine fiends in the United States.

That this estimate is somewhat high would appear from the report by C. G. Steinmetz, Jr., (*J. Am. M. Assoc.*, 1915, v. 64, p. 1271), who made a study of 15 cases of cocaine habit acquired by men employed where the drug was manufactured. The daily quantity taken varied from 20 to 60 grains; the method of taking was solely by snuffing it. Even on the basis of the lower quantity the consumption per annum would be in the neighborhood of 15 ounces and thus reduce the possible number of cocaine fiends very materially.

Pharmacists who have been unfortunate enough to meet with patients addicted

to the use of cocaine will appreciate that the figures given by Steinmetz are much more nearly in accord with actual practices than are the figures previously quoted. Taking all the available facts into consideration it would appear that the estimate made by the Committee of the American Pharmaceutical Association some years ago, that the drug addicts in this country do not exceed 200,000 in number is approximately correct even at the present time.

That the previously made estimates of the number of drug addicts in this country were altogether erroneous is further evidenced by the published reports on hospital admissions since the Federal anti-narcotic law came into effect. It had been predicted that the result of the enforcement of this law would be a besieging of hospitals by drug addicts and a crime wave of national scope accompanied by a trail of suicide and death. While the effect of the enforcement of the Federal anti-narcotic law has been clearly evidenced by hospital reports the results have been by no means so far reaching or so startling as had been expected.

The most shocking of the several available reports is that of Wm. D. McNally, Coroner's Chemist, Cook County, Chicago, (*J. Am. M. Assoc.*, 1915, v. 64, p. 1264), who states that during the month of March, seven deaths occurred in Cook county that were indirectly due to the sudden cessation of the use of morphine. Four died from taking an overdose of morphine. One of the four died from taking an overdose of "Dr. Weatherby's Remedy," a morphine cure containing over seventeen grains of morphine sulphate per ounce. During the month of December, 1914, not a single death occurred in Cook county from morphine. During January and February the record shows one death for each month.

Clifford B. Farr, (*J. Am. M. Assoc.*, 1915, v. 64, p. 1270), reports that since the enactment of the Harrison law the number of admissions to the Philadelphia General Hospital of cases of morphine and heroin addiction has markedly increased. In the first 68 days of 1915, 86 patients addicted to heroin were admitted, while in 1911 there was not one.

Other cities have reported similar results but so far as known the amount of suffering has not in any way measured up to the results that were predicted by newspaper writers and others when the Federal anti-narcotic law was under consideration.

Now just a word in regard to the origin of drug addiction. C. E. Terry, City Health Inspector of Jacksonville, Florida, in the report of a study of local conditions (*Am. J. Public Health*, 1914, v. 4, p. 32), states that of 213 cases of drug habituation studied by him personally their origins in the order of their frequency were as follows:

Through physicians' prescriptions or treatment personally administered 54.6 percent.

Through the advice of acquaintances (for the most part themselves users), 21.6 percent.

Through dissipation and evil companions 21.2 percent.

Through chronic and incurable disease 2.4 percent.

The conclusions reached by Terry agree very well with those enunciated by Brown that from 90 to 95 percent of the persons habitually using narcotics do so entirely unnecessarily.

It should be remembered that the figures quoted above refer solely to the number and kind of addicts, generally recognized as such, who use narcotic drugs in comparatively large amounts. There is still another, and a very pathetic side to the drug addict problem that has as yet received altogether too little attention. This problem involves the ways and means of generating the habit and also includes a consideration of the unfortunate who for one reason or another feel compelled to continue the use of comparatively small amounts of a narcotic drug.

Practically all authorities are agreed that the continued use of cocaine is a vice rather than a disease and the Federal as well as State anti-narcotic laws appear to recognize this fact and provide special safeguards to prevent the indiscriminate sale or distribution of even small amounts of cocaine or of preparations containing it.

With opium, morphine and related products on the other hand no such precautions have been taken despite the fact that addiction to the use of these drugs is generally recognized as a condition over which the individual patient has little or no control.

Up to the present time altogether too little authoritative information is available regarding the origin and subsequent progress of the condition commonly described as morphinism, because physicians usually see only the fully developed cases or the at times spectacular end results.

The morphine or opium addict, as a rule, is secretive and generally seeks relief in ways that are destined to make him an easy prey for the charlatan or advertising quack who promises a positive cure with secrecy.

Lambert, Towne, and others, who have made a study of drug addiction, agree with the conditions of Terry quoted above that a very large proportion of the persons addicted to the use of opium and its alkaloids have acquired their habit from the thoughtless renewal of prescriptions containing narcotics or by self-medication with preparations containing comparatively small quantities of an opiate.

In this connection it may be said that it is not generally realized that the taking of even small doses of opium or morphine, at regular intervals for a continued length of time will be more likely to develop the opium habit than the occasional indulgence in larger quantities.

It has been asserted (Petty, G. E., J. Am. M. Assoc., 1913, v, 61, p. 566), that the average person will develop an addiction to opium or one of its alkaloids after thirty days of daily use and that after the continued use of such a drug for three months or more, it is practically impossible to discontinue its use without medical aid.

With these several possibilities fairly well established it would appear to be unfortunate to endorse or even to countenance exception clauses in anti-narcotic laws, such as Section 6 of the Federal law, which permit of the indiscriminate sale or distribution of preparations that not alone may but positively will establish a habit that once established cannot readily be overcome.

In the Federal anti narcotic law we have the possibility of an accurate survey of existing conditions in connection with the use and abuse of certain narcotic drugs. The findings if they can be made a matter of record will place the blame for the illicit use of proscribed drugs where it rightfully belongs and will suggest ways and means for correcting existing abuses.

To secure efficient restrictions on the sale and distribution of narcotics, and to demonstrate that they are not primarily to blame for the generation and continuation of the addiction referred to, pharmacists individually should not alone be willing to comply with existing requirements under the law but should see to it that others engaged in the same line of business comply fully with the spirit as well as the letter of existing laws and regulations.

There can be no gainsaying the fact that the amounts of opium and of coca consumed annually in this country are out of all proportions to the actual need for medicinal purposes but to locate the existing leaks the followers of all branches of medicine, and particularly the men engaged in the practice of pharmacy, must make consistent and persistent efforts to purge themselves of even the suspicion of being directly or indirectly to blame for existing abuses.

---

### THE STANDARDIZING OF PHARMACY LEGISLATION.\*

---

J. H. BEAL, URBANA, ILL.

---

Judging from the multitude of restrictive and inquisitorial measures offered in the legislatures each year, the dealer in drugs and medicines should be regarded as a dangerous member of society, who needs to be closely looked after by those members of the community who find their chief enjoyment in regulating the business of other people.

In February of the present year, the writer began receiving abstracts of the bills affecting pharmacy which were pending before the various state legislatures. In April these abstracts made a pile nearly eight inches in height, each sheet representing from one to four or five bills. The original bills from which these abstracts were taken, all of them affecting pharmacy in some respect, if brought together in one place, would probably have made a pile of four or five feet in height, and this was for approximately one-half of the legislative season.

Some of these measures no doubt represented really needed and useful legislation, as they seem to have done in Illinois, but it is safe to say that the majority of them represented the meddlesome attempts of half-baked reformers who possessed only the vaguest of ideas on the subjects they sought to regulate, and their enactment would have been followed by grave inconvenience and damage to legitimate business without corresponding benefit to any one, unless to those for whom the bills sought to provide positions and salaries.

Some of these bills proposed to regulate the drug business in general; others confined themselves to particular features. Many of them related to the same subject, but no two of them were exactly alike in the regulations which they proposed to establish.

Those engaged in almost every other species of commerce and industry could tell the same tale of foolish, unjust and hurtful attempts to regulate the conduct of their affairs by legislative enactment, and the prayer of the whole business

---

\*Read at the meeting of the Illinois Pharmaceutical Association.

world today is to be relieved from constant meddlesome and pernicious interference on the part of the law-makers.

The mental attitude of the modern business man bewildered in a maze of legal restrictions is cleverly expressed in the following jingle:

"There's law for this and law for that,  
 The man in business sighed,  
 It keeps me guessing where I'm at  
 And how my hands are tied.  
 "My great concern today is not  
 That I may shortly fail.  
 I have to give my every thought  
 To keeping out of jail.  
 "For profits that may comfort me  
 No longer can I plan.  
 It's taking all my time to be  
 A law-abiding man,  
 "Oh, sorry is the plight I'm in,  
 I have no path to choose,  
 The court will nab me if I win,  
 The sheriff if I lose."

—Anon.

There was a time when the manager of a business needed only to insure the efficiency of his manufacturing processes and the quality of his products, and to provide the means for bringing his wares to public attention. Today one of the most important agencies of any line of industry or commerce is some agency to prevent its destruction through ignorant and fanatical legislation. There is no class or kind of commercial or industrial enterprise in existence, no matter how honestly or carefully conducted, that would not be utterly destroyed if those who are concerned in it were to accept without protest all of the foolish and meddlesome measures proposed for its regulation. And, be it remembered, all of this mass, or rather "mess," of regulation is proposed in the name of reform and in the alleged furtherance of the general welfare.

*Conservative and Radical Reformers.*—Man is a moral animal, in aspiration and theory at least, and it is natural for him to seek constantly the moral improvement of his race and age. With such aspirations every one worthy of the name of citizen must be in sympathy, but there is a wide difference of opinion as to the best methods of bringing them to practical realization.

The conservative reformer views the improvement of society and the amelioration of social evils as a regular and uniform process of growth and education; the radical conceives reform as a violent and explosive destruction of old institutions and the forcible introduction of new ones.

The typical radical is always more or less of a bigot, and when hot on the trail of a real or imaginary evil, his sense of moral values is usually so much disordered that all other human issues sink into insignificance compared to the particular ism to which he is pledged. His convictions are so intense that they degenerate into obsessions, and he is likely to consider any method justifiable that promises to contribute to the success of his cause. Principles of equity and justice that have been recognized for ages are of no account with him, if they

interpose any obstacle to his short-cut methods, or would delay the immediate attainment of the object upon which his heart is set.

His creed is:

THE BIGOT'S CREED.\*

"Believe as I believe, no more, no less;  
That I am right, and no one else, confess;  
Feel as I feel, think as I think;  
Eat what I eat, and drink but what I drink;  
Look as I look, do always as I do,  
And then, and only then, I'll fellowship with you.

"That I am right, and always right, I know,  
Because my own convictions tell me so;  
And to be right is simply this, to be  
Entirely and in all respects like me;  
To question, doubt, or hesitate, is sin.  
I reverence the Bible if it be  
Translated first and then explained by me;  
By churchly laws and customs I abide,  
If they with my opinions coincide;  
All creeds and doctrines I admit divine,  
Excepting those which disagree with mine.

"Let sink the drowning if he will not swim  
Upon the plank that I throw out to him;  
Let starve the hungry if he will not eat  
My kind and quality of bread and meat;  
Let freeze the naked if he will not be  
Clothed in such garments as are made for me.

" 'Twere better that the sick should die than live,  
Unless they take the medicine I give;  
'Twere better sinners perish than refuse  
To be conformed to my peculiar views;  
'Twere better that the world stand still than move  
In any other way than that which I approve."

*The Extravagance of the Reformer's Statistics.*—One of the characteristics of the radical reformer is the extravagance of the statistics by which he seeks to show the imperative necessity for the immediate enactment of the particular measure which he happens to be advocating. If we accept his figures at their face value, we marvel that civilization has been able to persist under the burden of evil which his computations would establish.

As a rule we may safely scale the enthusiastic reformer's figures by ninety percent, and still have left sufficient to cover all of the evils which have actual existence, with a liberal unused margin around the edges.

This exaggeration by the reformer is due partly to the natural disposition of the enthusiast to accept as true whatever he wants to believe, and partly, in some instances at least, to a deliberate intention to deceive. On one occasion a state official charged with enforcing the food and drug laws asked my opinion con-

\* Source unknown.

cerning a report which he was about to submit to the governor and legislature. My answer was that it would be a very good report if it did not contain so much fiction, to which he replied that if he did not "lie like sin" his department would not be considered of any account, and the legislature would not grant sufficient appropriations to pay half his inspectors and office force. In other words, the public has so long been fed upon extravagant statements concerning the evils in foods and drugs, that its jaded emotions will not readily respond to simple statements of the actual facts.

To the well-balanced, conservative citizen the law is merely a formal expression of the well-settled convictions of the majority, put into statute form for the purpose of compelling the obedience of that minority of the community who are not regardless of moral obligations, and to such a reformer the essential work of reform consists in the education of public opinion to the point where his own theories as to the citizen's civil and moral obligations shall become the faith of the many.

The theory of the radical is that statute law is an instrument for compelling other men to believe as he does, and instead of waiting for the slow and tedious process of education, he endeavors by frenzied declamation and the fury of his assault upon the general assembly to impose his will upon the majority.

In theory our newly-enacted laws represent the will of the greater number; in practice they represent the will of the comparatively small number who know best how to work the legislative machinery.

Nine-tenths of the laws enacted in any state the past winter would have failed if they had been submitted to a popular vote, either because a majority of the voters would have been opposed to their provisions or because they would not have cared enough about the measures to vote for them. That these measures were made into laws was not due to corruption or incompetence on the part of the law-makers, but rather to the defects inherent in our system of law-making, and to the fact that every man in public life soon learns that he has more reason to fear an active minority that will go to the polls and vote than a passive majority that will only stay at home and grumble.

*The Sham Reformer.*—Notwithstanding the bad manners of the honest radical and his constant attempts to reverse the laws of nature, he is much to be preferred to the commercial reformer, or the pestiferous individual who follows the mending of other men's affairs as a gainful pursuit. He is the wily individual who latches his personal chariot to some phrase or doctrine that stands for a great moral principle, or which represents some grand humanitarian service, secure in the knowledge that with such a motive power he can travel farther on the road to successful popularity and with less critical inspection of his personal baggage than in any other way. He specializes in moral political issues, and is usually popular and prosperous.

The formula for passing an alleged reform bill through the easy-running law-making machine, provided it is one that does not involve a matter of party policy, is comparatively simple. Given a measure with a humanitarian title, a few sensational newspapers to print editorials and play up the propaganda, with half a hundred men in different parts of the state to write letters to members of the legislature, and the trick is done.

The passage of a bill of this character is a commercial proposition, like the building of a house or the buying of a farm, the two great essentials being to properly finance the movement and to select an experienced manager to conduct the campaign. So well is this understood that moral reforming, or the putting through of legislation that can be made to wear a moral label and appeal to the emotions and sympathies has come to be a regular business, like the conducting of carnival shows or of evangelistic revivals. You can hire a troupe of expert reformers just as you can hire a troupe of expert evangelists, with all of the machinery necessary to the conduct of their highly specialized profession, including the services of experienced spell-binders and leader-writers, and of one or more periodicals. The managers can furnish testimonials of former successful campaigns to show their ability, and you can contract with them either on a flat rate basis, or for a percentage of the gate receipts; or in case the reform is conducted under the auspices of a periodical publication, you can pay in subscriptions or by the purchase of advertising space.

It is by virtue of such methods and our loose system of lawmaking that we have laws passed ostensibly in the interest of the public health and welfare, but in reality to foster the business enterprises of those who financed the propaganda that procured their enactment; that in some states we have statutes expressly prohibiting the doing of things which the statutes of other states expressly command to be done; that in one commonwealth a given subject is legislated upon in one way, and in the adjacent commonwealth in an entirely different way, so that the man who does an interstate business must have as many different labels and as many formulas and methods of manufacture as the number of states in which he does business. In fact, under our hap-hazard and helter-skelter system, laws are so easily passed and so promptly forgotten that it occasionally happens that the same measure is placed upon the statute books twice, its first enactment having been overlooked by the enthusiasts who were more intent on passing new laws than upon enforcing the old ones.

*A Proposed National Policy Regarding Drug Legislation*—From the annual flood of new and unnecessary laws there is hope of at least a partial relief through a general agreement of the drug trade in all of the states to the effect that hereafter all drug legislation of every kind, no matter from what source it comes nor by whom presented, shall be resolutely opposed unless it has first received the consideration of the national pharmaceutical organizations and also of the association of the state where it is proposed for enactment.

The adoption of such a general policy would not mean that the drug trade intended to set itself in opposition to any proper measure for public protection, but it would be the giving of notice that the trade will no longer serve as a punching bag for every fanatic with an itch for publicity, and that hereafter proposed drug legislation shall be held up until its necessity is established upon some better evidence than the unsupported statements of its proponents, and until there has been ample time to analyze its provisions and to estimate their probable effects.

It is to be expected that the hysterical reformer who believes his pet proposition to be of supreme importance to human welfare, will assail any policy that will tend to prevent its immediate adoption. Our answer should be that if his propositions are not good enough to withstand the cool and discriminating dis-

cussion of the pharmaceutical associations, they are not good enough to be placed on the statute books.

*The Preparation of Standard Forms of Food and Drug Laws.*—A second step towards relief from the constant menace of fantastic legislation is for the drug trade through its national and state organizations to begin the standardizing of the laws relating to pharmacy by uniting in the preparation of a complete series of model forms or patterns covering every phase of legal drug regulation.

It is true that some model drafts have previously been issued, but they have usually represented only a single organization, and at most have covered only a fraction of the field of food and drug legislation. The series of drafts here proposed would be the result of the deliberations of every branch of the drug trade, and would cover every phase of the subject.

It is not likely that all of the associations would arrive at a perfect agreement upon every detail of the drafts, but it is morally certain that the more generally the drafts were discussed the fewer would be the points upon which there would be disagreement, and the final result would be a material step towards the standardizing of pharmacy legislation and towards substantial uniformity in the food and drug laws of all the states, not of course uniformity in all particulars, but uniformity in all matters of importance, with such variations only as were required to meet special conditions.

A practical example of this method of standardizing pharmacy legislation is shown in the method adopted for promulgating the N. A. R. D. model for a state anti-narcotic law to bring state laws into conformity with the Harrison Law. This draft was prepared by a special committee after much serious thought and consideration, but the committee was not so vain as to assume that its efforts were incapable of improvement. It is expected that the measure will be submitted in turn to the various state and national associations for further discussion and amendment, so that when finally completed it may be regarded as representing the very best thought of the entire drug trade upon this subject, and fit to serve as a reliable pattern which can be consulted whenever state legislation upon the subject of narcotic drugs is being planned.

A committee of the American Pharmaceutical Association is now working upon the draft of a general pharmacy law, which no doubt, will be also submitted to all of the other pharmaceutical associations for discussion and the suggestion of amendments.

It is not possible for any one individual, or for any single group of individuals to foresee and provide for all of the contingencies likely to arise from the introduction of new regulations into so complicated a business as the manufacture and distribution of drugs and medicines, and no measure proposing either to change or to add to the existing laws on the subject should be placed on the statute books before two or three years of consideration by the state pharmaceutical association.

Furthermore, this consideration of proposed legislation should not consist of its perfunctory reference to a special committee and an equally perfunctory approval of the committee's report, but of a thorough going analysis of each section and provision by the whole association until the meaning and ultimate bearing of every clause and phrase have been developed so far as it is humanly possible to

foresee them. It would be a brief and trifling measure indeed that would not be worthy of an afternoon's discussion, and if it is one of any considerable length or complexity it is probable that the entire time of an annual meeting would not be too much for its adequate consideration.

It is no part of this plan to rush these model bills to the legislatures for immediate enactment. The prime object is to provide a series of carefully thought out, well-balanced, and accurately drafted measures to be made use of only when there is a real need of new legislation, or when it is necessary to quickly find a substitute for the crude and sloppy attempt of some crank reformer.

*The Proper Education of Public Opinion.*—Another essential in the campaign against useless legislation is the better education of the general public as to what constitutes necessary and proper regulation of the sale of drugs and medicines.

Every one owes it to his calling to protect its good reputation as zealously as he would protect his own. Every individual druggist, and every association should enter prompt protest through the press of their community against every extravagant tale of the sensation monger which reflects unjustly upon the drug business.

The American public is a fair-minded jury, but like every other jury it must base its conclusions upon the evidence and arguments which are brought to its attention. If we do not deny or protest against the sensational stories of the druggist's faults and crimes, we have no right to reproach the jury for accepting the alleged facts as true.

Not only is the general public disposed to be fair to the druggist, but it is already beginning to suspect that it has been victimized by the office-seeking patriot with his talk of wholesale adulteration of foods and drugs, and the reckless selling of narcotics and of dangerous and fraudulent medicines, and it is more than ever ready to listen to what the druggist has to say in his own defense.

The gods help those who help themselves.

---

REPORT OF COMMITTEE ON DRUG MARKET, PENNSYLVANIA  
PHARMACEUTICAL ASSOCIATION.\*  
(1914-1915.)

The report of your Committee on Drug Market is given under world conditions which have created effects never before experienced in the drug trade. Dependent as we are upon Europe for many of our crude drugs and fine chemicals, a conflict such as is now raging there has great effect upon the drug trade in this country. Although we have recovered somewhat from the semi-panic and disorganized condition existing during the first few weeks after the outbreak of the war, there is still an inevitable shortage of some drugs, due in part to the severance of the means of communication and transit with those countries which have supplied us with them; the enlistment of men in the various armies and the use of many products in large quantities by the fighting forces of the nations at war.

---

\* Presented to Pennsylvania Pharmaceutical Association, June, 1915.

Before the British Order in Council of last March went into effect it was not so very difficult to obtain supplies from Germany or Austria, but conditions since the order became operative have become more serious and are steadily becoming worse. Goods that were ordered before the British order went into effect were permitted to be shipped after that date, but considerable delay was usually experienced, sometimes extending over three or four months, on account of the requirement that contracts, invoices, etc., be submitted to the British Government for inspection. Cases are known where so much time has been lost on account of the negotiations that the foreign shipper in a neutral port has been compelled to return the goods to the original shipper rather than submit to the continued loss of interest on the money invested. The situation is also complicated on account of the fact that certain steamship lines trading between the United States and Holland usually refuse to carry goods of German origin. Their reason for doing so is to protect their vessels from delay or seizure by the blockading fleet.

A new development is seen in the fact that the drug centers of Europe have been shifted from Hamburg and Trieste to Rotterdam and until recently to Genoa. Marseilles is shipping more than the usual amount. New York has also benefited, as South American goods that were formerly obtained through Hamburg brokers are now shipped direct to New York and from there distributed throughout this country and those countries of Europe that can be reached. Since Italy's participation in the conflict it is practically impossible to obtain goods from Trieste.

However, in spite of existing conditions, it is a remarkable fact that there has not been much lowering of quality nor more than the normal amount of adulteration. Some errors have naturally occurred on account of the advent of brokers in neutral European countries into the drug trade who knew practically nothing about the goods they were handling; for instance, one broker who before the beginning of hostilities was engaged solely in the non-medicinal seed business wanted to know what a pharmacopœia was and to send him one.

Some of the goods examined owe their inferior quality to improper gathering, some on account of having been placed in dirty packages, some others on account of the depletion of the regular stocks and others on account of accidental admixture with small amounts of foreign substances. Instances of seeming inferiority are also due to confusion of standards as established by various manufacturers. A condition worthy of notice is demonstrated by the fact that drugs found adulterated last year were found to be authentic and of standard quality this year, showing the value of publicity and education.

An improvement has been noticed in the quality of some substances usually found inferior; for instance, it is now possible to obtain mineral oil that is tasteless, odorless, free from fluorescence and color and equal to the Russian variety. It is true that it is lower in specific gravity, but it is claimed by the refiners that a low specific gravity does not necessarily indicate a thin mineral oil.

Summing up the situation in the drug market at the present time, we have found that the quality of the goods on the market is equal to that existing last

year. Of the hundreds of samples examined there were only five cases of adulteration or substitution and only two or three instances of goods of grossly inferior quality. There is quite a scarcity of goods, such as antipyrine, carbolic acid, salicylic acid, sodium salicylate, salol, phenacetin, etc. The great demand for ipecac occasioned by the use of emetine as a remedy for pyorrhea alveolaris and the low price of menthol are also noteworthy.

Following its usual custom the committee has taken advantage of the generosity of the firms of H. K. Mulford & Co. and the Smith, Kline & French Co., and have taken the following data from their analytic files. The matter presented at this time does not of course represent all the substances examined by these firms, but are typical of those articles examined during the periods extending from May 31, 1914, to June 1, 1915.

Preceding the comments on the goods examined during the past year we present the following observations, contributed by Mr. C. E. Vanderkleed, the Chairman of our Committee, in regard to the labeling of U. S. P. substances:

The presence of qualifying words and phrases other than the letters "U. S. P." on U. S. P. substances and the absence of "U. S. P." on strictly U. S. P. substances is very common. It is difficult to fathom the reason for leaving off the letters "U. S. P." from the label of a U. S. P. substance when the substance is strictly U. S. P. since the statement that the substance is "U. S. P." adds distinction to the quality of the substance. Some of the qualifying words and phrases noted were:

"Formaldehyde U. S. P.—Methyl alcohol and water 62.7%—Formaldehyde 37.3%." In this case an ingredient, methyl alcohol, is stated which is not mentioned in the U. S. P., although of course it is commonly understood to be present to some extent.

"Formaldehyde U. S. P.—Methyl alcohol 62.7%—Formaldehyde 37.3%." This is intended to be the same as the above but the labeler accidentally omitted the statement "and water."

"Iodine, Crude, Com'l." was strictly U. S. P. except that it was in lumps instead of plates.

"Calomel, White" was strictly U. S. P.

"Manganese Dioxide, Heavy" was strictly U. S. P.

"Acetic Acid 36%." Evidently "U. S. P." was intended to be the information conveyed by "36%." However, an acetic acid may be 36% without being U. S. P., but not U. S. P. without being at least 36%.

"Acid Acetic, U. S. P. 99%" was the label on a lot of Galacial Acetic Acid U. S. P.

"Ox-gall" without any modifying statement was used on a package of powdered ox-gall.

"Oil Sassafras, True," was strictly U. S. P.

"Caffeine Alkaloid" a common method of labeling caffeine U. S. P.

"Oil Rosemary, for Technical Use" was below U. S. P. requirements in total borneol content.

"Arsenous Acid, Pure" was strictly U. S. P.

"Acetic Ether, 90%" was strictly U. S. P.

"Oil Fennel Seed, Sweet," was strictly U. S. P.

"Colchicine Pure, Cryst." contained about 22% chloroform of crystallization.

"Colchicine, Amorphous" was practically U. S. P. in quality.

"Oil Lavender, English and French Blended, U. S. P." was strictly U. S. P.

"Oxalic Acid, for Tech. Use" contained 0.156% non-vol. residue, was a trifle dirty but otherwise U. S. P.

"Indigo-Disulpho-Acid, not to be used in food products," contained a trace of heavy metals.

"Saccharin, Insoluble," required 500 parts instead of the 250 parts of water required by the U. S. P. for solution. It was otherwise strictly U. S. P.

"Ozone Vanillin" was strictly U. S. P.

"Petrolatum U. S. P. Extra Amber" was strictly U. S. P.

"Petrolatum U. S. P. Lily Ambers" was strictly U. S. P.

"Glycerin Pure" gave faint opalescence in test for sulphate, contained a trace of butyric acid but was otherwise U. S. P.

"Chloroform for Anaesthesia. Contains about  $\frac{3}{4}\%$  alcohol." Was strictly U. S. P.

"Citric Acid, U. S. P., Dried and Powd.," was U. S. P. citric acid powdered but not dried.

"Tartaric Acid, Dried and Powd., U. S. P.," was strictly U. S. P. The "dried" in the name is superfluous.

*Acetone*.—Of the ten lots examined, only three complied with all the U. S. P. requirements. Three samples had slightly higher boiling points and were slightly lower in strength, two other samples were low only in strength and two had high boiling points. The strength of the various lots ranged from 98.5% to 99.66%, and the boiling points from 56° C. to 59° C. Reported by J. G. Roberts.

*Acid Acetic*.—All of the samples examined were of good quality. Reported by J. G. Roberts.

*Acid Cresylic*.—One sample of 98% to 99% strength had a pronounced objectionable tarry odor. Reported by J. G. Roberts.

*Acid Oleic*.—The improvement noted in the 1914 report still continues as the four lots examined were all of U. S. P. quality. Reported by J. G. Roberts.

*Acid Salicylic*.—An examination of eight lots demonstrates the wisdom of raising the present U. S. P. melting point standard from 156° to 157° C. to 156° to 159° C. as proposed for the U. S. P. IX. Only three lots complied with the present requirement of 156° to 157° C. Three of the others melted at 158° C. and two at 159° C. All the samples were satisfactory in every other respect. Reported by J. G. Roberts.

*Acid Sulphuric*.—Two lots examined were found to contain 91.3% and 92.6%, respectively, of absolute  $\text{H}_2\text{SO}_4$ . Reported by J. G. Roberts.

*Acid Trichloroacetic*.—None of the lots examined gave a faint reddish color with  $\text{FeCl}_3$  as required by U. S. P., but even reagent acids refuse to conform to this test. Reported by G. E. We.

*Aconite Root*.—An improvement was noted in the quality of Aconite as all samples examined complied with the U. S. P. requirement of not less than 0.5% aconitine. The following results were obtained on four lots: 0.505%, 0.5%, 0.63% and 0.64%. Reported by J. G. Roberts.

*Alcohol*.—The only lot examined failed to answer the U. S. P. aldehyde-oak tannin test. This is not an unusual condition, however, as all of the samples examined during recent years have contained traces of these impurities. Reported by J. G. Roberts.

*Alkanet Root*.—An examination of an average of four samples revealed the fact that it contained only 1.55% of anchusin. The British Pharmaceutical Codex states that Alkanet Root should contain not less than 5%. The samples were unsatisfactory in appearance on account of the presence of an undue proportion of leaf bases which were attached to the upper portion of the root and which are claimed to contain no coloring matter. As alkanet root is mostly used as a coloring agent it can be readily seen that an undue proportion of leaf bases is undesirable. Reported by J. G. Roberts.

*Aloes*.—No improvement has been noted in the quality of Socotrine Aloes, as four lots examined were in a poor physical condition and failed to comply with several U. S. P. requirements. They contained excessive moisture and an abnormal amount of alcohol insoluble material. The moisture ranged from 15.0% to 23.4%. It was found also that the yield of ash from samples taken from various kegs was quite varied as the following results demonstrate: 4.4%, 4.5%, 5.2%, 4.67%, 4.71%, 12.2%, 4.95%, 13.52% and 30.3%. There was quite a difference in the physical condition of the contents of kegs comprising the various shipments. Some kegs were full of soft semi-fluid aloes of uniform quality, while others were only partially full and contained a mixture of hard and soft aloes. The latter

kegs were probably from an older lot as the aloes were quite hard at the top and sides and soft to within about three inches of the top. An illustration of the variable character of the contents of various kegs is shown by the fact that a sample from the driest keg contained 15% moisture and a sample from the softest contained 23.4%. Reported by J. G. Roberts.

*Alum, Dried and Powdered.*—Great improvement in moisture content has been noted, none of the samples containing more than 6%, which is close to our arbitrary standard of 5% moisture. Reported by J. C. McCaffrey.

*Anise Seed.*—About 1% of coriander seed was found in one lot and was probably present as the result of accidental admixture. Reported by J. G. Roberts.

*Asafetida.*—Two lots were up to the 50% soluble in alcohol requirement, running 61.9% and 59.0%, respectively. The ash contents were 13.1% and 22.5%, respectively. Reported by W. H. Orrick.

*Barium Peroxide.*—An examination of seven lots gave strength results ranging from 87.12% to 89.4%. Reported by J. G. Roberts.

*Belladonna Leaves.*—Quite a variation was found in the alkaloidal content of 23 samples examined during the past year as the results obtained ranged from 0.199% to 0.587% of mydriatic alkaloids. Most of the samples were of U. S. P. quality as only four yielded results below the U. S. P. standards of 0.3%. One sample examined was in a poor physical condition as it was found to contain about 50% of stems. The remainder was composed of buds and stems and badly broken and ground leaves. Two instances of substitution were encountered as one sample was composed wholly of *phytolacca* leaves and one lot of a mixture of *belladonna* leaves and *scopola* leaves. Of the twelve bales composing this lot two were practically all *scopola* leaves, five contained not less than 25%, four not less than 50% and one not less than 75%. Reported by J. G. Roberts.

*Belladonna Root.*—Three lots contained 0.46%, 0.522% and 0.48%, respectively, of mydriatic alkaloids. Reported by J. G. Roberts.

*Benzoin.*—The five lots tested ranged between 67.8% and 76.5% in alcohol solubility, and 0.96% and 1.62% in ash. Reported by G. E'We.

*Betanaphthol.*—Both of the samples examined were not sufficiently soluble in alcohol, one of them also contained a slightly abnormal amount of organic impurities. Reported by J. G. Roberts.

*Bismuth.*—The only lot examined contained minute traces of arsenic and iron. Reported by J. G. Roberts.

*Burdock Root.*—One of the two lots examined was grossly inferior. It was wormy, rotten and dirty and was considered a very undesirable article. Reported by J. G. Roberts.

*Calcium Carbonate Precipitated.*—Usually gives slight precipitate in test for "limit of iron, aluminum and phosphates." Reported by J. C. McCaffrey.

*Calcium Chloride.*—One lot left 1.4% residue in U. S. P. test for Magnesium and alkalies, while the U. S. P. allows only 0.1%. Reported by J. C. McCaffrey.

*Calcium Glycrophosphate.*—The following results were obtained on three samples of different makes when tested according to the methods proposed for the U. S. P. IX:

Sample Number	1	2	3
Proportion soluble in water.....	1 gm. in 50 cc.	1 gm. in 50 cc.	1 gm. in 50 cc.
Reaction of aqueous solution to litmus.....	Acid	Alkaline	Acid
Phosphates .....	None	None	None
Heavy Metals.....	None	None	None
Sulphates .....	None	None	None
Chlorides .....	Normal	Normal	Normal
Alcohol soluble impurities.....	4.19%	0.67%	7.27%
Moisture at 130° C.....	10.70%	7.32%	9.17%
Residue upon ignition.....	49.40%	55.82%	47.43%
Strength .....	81.68%	92.29%	78.42%

Sample No. 2 was the only one that met the requirements as it was above 90% strength and was alkaline in reaction. It contained some alcohol soluble impurities, but it was considered that the slight amount present was unobjectionable. Reported by J. G. Roberts.

*Calcium Phosphate*.—One lot contained chlorides in excess of U. S. P. allowance. Reported by G. EWe.

*Cannabis Americana*.—An examination of one sample showed it to be in poor physical condition and almost physiologically inert. A separation of seeds from three other samples revealed the presence of 1.47%, 4.22% and 13%. Reported by J. G. Roberts.

*Chromium Sulphate*.—The two lots examined assayed 85.4% and 87.1%  $\text{Cr}_2(\text{SO}_4)_3$ , respectively. Reported by G. EWe.

*Colchicine*.—Colchicine continues to contain excessive quantities of chloroform and moisture. The thirteen lots examined lost 2.2%, 4.2%, 8.3%, 9.1%, 9.3%, 10.3%, 12.1%, 12.7%, 12.9%, 22.3% and 29.2% of their weight at 102° C. the loss in each case, with the exception of the 4.2% figure, being due chiefly to chloroform. The lot losing 4.2% lost only moisture. There is probably no excuse for the excessive quantities of chloroform left in this alkaloid, as it is readily driven off on heating without appreciably affecting the color of the alkaloid. It is difficult to obtain a good qualitative reaction with the U. S. P. Hydrochloric Acid-Ferric Chloride-chloroform test if the mixture is heated only to boiling, as required by the U. S. P., but if the boiling is continued for one to two minutes guarding against excessive evaporation a good reaction is always obtained. Reported by G. EWe.

*Colchicum Seed*.—0.82% Colchicine was found in the only lot examined. Reported by J. G. Roberts.

*Cresol*.—One lot examined was of U. S. P. quality in every respect. This is an uncommon condition as the specific gravity is usually abnormal. The specific gravity of five other lots ranged from 1.029 to 1.045; two of these had too high a boiling point as only 32% and 64% of distillate was obtained between 195° and 205° C. Reported by J. G. Roberts.

Only two of the sixteen lots examined had a specific gravity within the U. S. P. limits of 1.036-1.038, these two having specific gravities of 1.037 and 1.038, respectively. One of the others had a specific gravity of 1.039, one had specific gravity of 1.016 and the other twelve ranged between 1.030 and 1.033. All of the samples answered the U. S. P. requirement of 90%, distilling between 195-205° C. except one of which only 86% distilled. It is almost impossible to obtain cresol soluble in 60 parts water, but as a rule the insoluble portion is very small in amount. All other U. S. P. requirements were complied with by the samples. Reported by G. EWe.

*Cubeb Stems*.—An experimental determination produced about 5% of oil by steam distillation. Reported by J. G. Roberts.

*Dandelion Root*.—No chicory or any other adulterant was found in five lots examined. Reported by J. G. Roberts.

*Digitalis*.—The physiological activity of three lots was satisfactory. Reported by J. G. Roberts.

*Dragon's Blood*.—A comparison of the coloring power of one sample with a control sample showed it to be only about  $\frac{1}{3}$  as valuable. Reported by J. G. Roberts.

*Elm Bark*.—Considerable of the brownish outer bark was found in one rejected sample. Reported by J. G. Roberts.

*Ether*.—An examination of two samples of ether gave the following results:

Sample Number	1	2
Physical appearance	Normal	Normal
Specific gravity @ 25° C.	0.7149	0.7145
Residue from 25 cc. at 25° C.	.0001 gm.	.0001 gm.
Boiling point	35° C.	35.5° C.
U. S. P. excess of alcohol and water test	Normal (19.75 cc.)	Normal (19.65 cc.)

Neither of these samples complied with all the requirements of the U. S. P., as they contained aldehyde and an excess of acid. One sample also left a foreign odor when evaporated from filter paper.

Both samples complied with the U. S. P. boiling point requirement and the test to determine the presence of an undue amount of alcohol or water. They each had lower specific gravities than that specified in the U. S. P., but that is a desirable quality as it indicates a strength a little above that required by the U. S. P.

The U. S. P. states that moistened blue litmus paper should not be reddened when immersed in ether for 10 minutes and also that no color should develop when 10 cc. of ether is occasionally shaken during one hour with 1 cc. of potassium hydroxide test solution. Upon applying these tests to the sample it was found that an excess of acid was present in each of them as one sample reddened the paper in 1 minute and the other in  $\frac{1}{2}$  minute. The presence of aldehyde was proven when both samples imparted a yellow color to the potassium hydroxide solution. Reported by J. G. Roberts.

*Flour (Wheat).*—Gluten ranging from 11.5% to 14.5% was found in 29 lots examined. Moisture determination on five lots yielded results ranging from 9.95% to 12.8%. Reported by J. G. Roberts.

*Formaldehyde.*—All the formaldehyde examined exceeded in specific gravity the U. S. P. requirement of 1.075-1.081, averaging between 1.082 and 1.087; most of them gave reactions for chloride, sulphate and calcium in the U. S. P. tests for same, but were otherwise U. S. P. Reported by T. Liberati.

*Glycerin.*—Two lots were rejected on account of color and their undesirable dirty appearance. Reported by J. G. Roberts.

*Guaiac.*—Alcohol solubility ranged between 77.5 and 99.2%, only one being below U. S. P. standard of 85% soluble. Ash ranged between 0.51 and 5.70%, only one being above U. S. P. standard of 4%. Reported by G. E'We.

*Hellebore.*—1.21% of total alkaloids was found in a seventeen-bale lot. Reported by J. G. Roberts.

*Hydrastis.*—Each of the seven lots examined was found to comply with the U. S. P. standard of not less than 2.5% hydrastine and were found to contain the following amounts: 3.18%, 3.82%, 3.61%, 3.12%, 2.78%, 2.94% and 2.79%. Reported by J. G. Roberts.

*Hydrogen Peroxide.*—The twenty-three lots examined were satisfactory with the exception that two gave total solids of 0.0479 gm. and 0.0340 gm. per 20 cc. sample, in which test the U. S. P. requires not more than 0.030 gm. Reported by N. Saito.

*Hyoscyamus Leaves.*—Only one of the nine lots examined complies with the U. S. P. mydriatic alkaloids requirement. The other samples contained 0.04% to 0.06% of mydriatic alkaloids. Reported by J. G. Roberts.

*Ipecac Root.*—Results ranging from 1.83% to 2.06% of alkaloids were obtained in the examination of five shipments. Reported by J. G. Roberts.

*Iron (Ferrous) Sulphate, Dried and Poked.*—Continues to vary greatly in  $2\text{FeSO}_4 + 3\text{H}_2\text{O}$  content. The fifteen lots tested ran as follows: 80.0, 83.1, 88.5, 91.3, 91.9, 92.3, 92.6, 93.4, 93.4, 95.2, 96.0, 96.0, 99.0, 103.0 and 104.8 percent. Reported by W. H. Orrick.

*Kamala.*—Adulteration was indicated when three samples yielded 53.5%, 49.1% and 56.9%, respectively, of ash. It is said that red sand is often added to such an extent that an ash yield of 40% to 60% has been obtained. Foreign pharmacopeias place the ash limit between 6% to 10%. Reported by J. G. Roberts.

*Keisलगuhr.*—Much of the Keisलगuhr offered for pharmaceutical purposes contains organic matter, from which this product should be freed by ignition. Reported by G. E'We.

*Laundry Blue.*—Several lots were not sufficiently soluble in water and gave a reddish tint to the aqueous solution. One lot was found to contain 0.7% of water insoluble material. Reported by J. G. Roberts.

*Licorice Root.*—12.27% of glycyrrhizin was found in one sample. One authority places the standard at six to eight percent. The residue upon ignition was 6.59%. Reported by J. G. Roberts.

*Lupulin*.—The ten lots examined showed:

Soluble in Ether	Ash
55.5%	8.23%
55.0%	7.72%
57.1%	7.60%
58.6%	10.70%
54.7%	19.40%
67.6%	13.30%
55.3%	18.30%
44.2%	28.40%
69.2%	12.80%
68.2%	11.40%

The U. S. P. requires 60% soluble and not more than 10% ash. Reported by L. H. Glickman.

*Magnesium Carbonate*.—Two of the six lots examined were low in MgO after ignition, these two assaying 92.6%, and 94.8%, respectively. Five of the six lots contained calcium in excess of the U. S. P. limits. The six lots were otherwise U. S. P. Reported by G. EWe.

*Magnesium Oxide*.—One lot contained only 93.9% MgO after ignition, U. S. P. requiring 96%. None of the lots examined during the past year gelatinized with water as required by the U. S. P. and most of them contained calcium in excess of the U. S. P. limits. Reported by G. EWe.

*Magnesium Sulphate, Dried and Pored*.—The usual variation in water-content was noted during the past year. The five lots examined contained 14.9%, 26.9%, 27.7%, 29.8% and 31.5%, respectively. Reported by L. H. Glickman.

*Manaca Root*.—During a recent examination of Manaca Root it was found that information concerning it is rather meager, so that it became necessary to base our results upon a comparison made with a sample that was declared to be genuine Manaca Root. During the examination of the literature on the subject it was found that some authorities claim that there is a red and a white manaca. The Red Manaca is given the most prominence and is the only variety described. The White Manaca is merely mentioned and no description whatever is available concerning it.

The samples submitted for examination were in large pieces about 18 inches long, knotted at one end and tapering from about 3 inches at the knotted end to about one-half inch at the small end which, however, had been cut. They had a yellowish-red color, a pronounced and distinctive odor and were covered with a thin, easily removed flaky scale. They were rather tough and broke with a fibrous uneven fracture. The bark was relatively thick and could be peeled with little difficulty. The authentic sample had a reddish-brown color and a similar but not as strong an odor. It differed also from the other sample in the fact that it is hard and has a thin, tenacious bark and breaks with an uneven fracture.

A microscopical examination revealed important differences in both the transverse and tangential sections. In transverse sections the medullary rays of the authentic sample are only one cell wide, while they were one to four cells wide in the trial sample. The pitted ducts are also slightly smaller in the authentic than in the trial sample. In tangential sections the medullary rays are few in the authentic sample and quite numerous in the trial sample. Starch grains are present in the medullary rays of both samples. In both the transverse and tangential sections the cork layer is much wider in the trial than in the authentic sample.

In accordance with the results obtained in the foregoing examination it was considered that the sample submitted for examination was not true Manaca but a closely related species. Reported by J. G. Roberts.

*Manqanese Dioxide*.—A sample of poor quality was examined which was only 95.66% pure (U. S. P. 80%), and which contained 17.13% of antimony sulphide and insoluble substances. Reported by J. G. Roberts.

One lot contained some insoluble residue in test for "antimony sulphide and insoluble substances," but was otherwise U. S. P. Reported by J. C. McCaffrey.

*Manganese Sulphate*.—Continues to vary greatly in water content. The seven lots examined contained 29.4%, 31.7%, 32.3%, 32.5%, 35.9%, 37.3% and 37.4%, respectively, four being above the U. S. P. limit of 32.3%. These figures for moisture were obtained by employing the lowest possible red heat on the manganese sulphate in a porcelain crucible. The U. S. P. directs that the salt be "gently ignited." Different loss in weight of the salt is occasioned at different degrees of ignition. Reported by G. E'We.

*Milk (Dried)*.—One lot which contained only 0.56% fat was probably made from skimmed milk. Reported by J. G. Roberts.

*Mustard (Yellow)*.—An examination of one ground sample yielded the following results: Ash 5.88%, ether extract volatile at 110° C. 0.1%, ether extract non-volatile at 110° C. 14.53%, moisture 6.33%, turmeric or charlock none. Reported by J. G. Roberts.

*Oil of Anise*.—Two lots which complied with all the U. S. P. requirements contained traces of lead. Reported by J. G. Roberts.

*Oil Anise, Chinese*.—Two samples were nil in optical rotation but answered all the other requirements for Oil Anise, U. S. P. The U. S. P. requires a laevogyrate rotation. Reported by G. E'We.

*Oil of Cod Liver*.—The saponification numbers of various samples ranged from 186.07 to 190, and the iodine numbers ranged from 151.44 to 162.9. Not one of the eight lots examined complied with the U. S. P. saponification value requirement of 175 to 188 and iodine value requirement of 140 to 150, but were all within the limit proposed for U. S. P. IX. Reported by J. G. Roberts.

*Oil Lemon*.—The six lots examined tested 3.52%, 3.56%, 3.63%, 4.08%, 4.18% and 4.32% citral by the method of J. C. Umney in *Perfumes and Essential Oil Record*, 1913, 4, 269. Reported by T. Liberati.

*Oil Lemon, Extra Strong*.—There is no declared citral content on this product and it varies accordingly. The two lots examined assayed 12.55% and 21.5% citral by method of J. C. Umney. Reported by T. Liberati.

*Oil of Neatsfoot*.—The rejection of one lot was recommended on account of its high specific gravity and iodine value. Lewkowitsch quotes specific gravities of pure oils ranging from 0.914 to 0.917 at 15° C. and iodine values from 66 to 71. The rejected sample had a specific gravity of 0.9227 and an iodine value of 91.9. It also had a higher congealing point than is usually found for Neatsfoot Oil as other samples examined ranged from 22° F. to 42° F. This sample congealed at 50° F. Reported by J. G. Roberts.

*Oil Wormseed*.—One lot was adulterated with 44% of a fixed oil. Oil Wormseed ordinarily averages 1.5% non-volatile residue. Reported by G. E'We.

*Oxgall, Powd.*—None of the Powd. Oxgall examined this past year contained starch; a decided improvement in this product. Reported by W. H. Orrick.

*Petrolatum (Liquid)*.—Owing to the shortage of supply from European sources a fine grade of medicinal mineral oil of American origin has been placed on the market. It complies with the requirements of the U. S. P. with the exception of specific gravity, which has ranged from about 0.835 to 0.853. Reported by J. G. Roberts.

The Russian variety being practically unobtainable, resource must be had to oil from other sources. These oils are difficult to obtain free from kerosene taste and fluorescence and are much lower in specific gravity than desirable. Reported by G. E'We.

*Quinine Alkaloid*.—Extreme variation in water content of this alkaloid is still noted. The nine lots examined contained 0.0, 7.3, 9.3, 11.3, 12.5, 12.7, 13.0, 15.1 and 20.0 percent water, respectively. The U. S. P. allows 14.3 percent. Reported by N. Saito.

*Resin Jalap.*—One lot was not completely soluble in five times its weight of ammonia water. Reported by W. H. Orrick.

*Resin Scammony*.—Sample did not comply with the U. S. P. ether and turpentine solubility requirements and did not give satisfactory results with the sulphuric acid identity test. According to the U. S. P., Resin Scammony should be completely soluble in turpentine and almost completely soluble in ether. We have never examined a sample that was wholly soluble in turpentine but have had several that were almost completely soluble in ether.

The ether solubility test is a strong indication of the purity of Resin Scammony as the spurious varieties are not nearly so soluble as the genuine U. S. P. variety which is not less than 95% soluble in ether. As the sample submitted for examination yielded only 68.2% of ether soluble material it was considered to have been obtained from one of the spurious varieties. Reported by J. G. Roberts.

*Sanguinaria*.—The following amounts of alkaloid were obtained from the four lots examined: 2.88%, 4.09%, 4.7%, 2.86%. Reported by J. G. Roberts.

*Sodium Benzoate*.—A twenty-barrel lot of generally inferior quality was rejected. It had a yellowish color and an undesirable odor. It also contained 4.9% of chloride computed as Sodium Chloride and was only 88% pure. Reported by J. G. Roberts.

*Sodium Glycerophosphate* (75% Solution).—The following results were obtained on two samples:

	No. 1	No. 2
Reaction of 1-20 solution.....	Very alkaline	Alkaline
Heavy Metals .....	None	None
Phosphates .....	None	None
Alcohol soluble impurities.....	0.14%	0.17%
Strength as anhydrous Sodium Glycerophosphate.....	53.63%	59.97%

Neither of the samples comply with the proposed standard of not less than 66%. It is possible, however, that the manufacturers do not calculate on the anhydrous basis as Sodium Glycerophosphate containing  $5\frac{1}{2}$  molecules of water is manufactured. Calculating upon this basis, sample No. 1 would be increased to 78.23%, and sample No. 2 to 87.46%. Reported by J. G. Roberts.

*Sodium Iodide*.—One lot assayed 95.2% absolute NaI; the low assay being due to moisture. Reported by G. E'We.

*Sodium Salicylate*.—A 500 lb. lot was rejected on account of being 4% low in strength. Several samples also contained traces of heavy metals, according to the U. S. P. test. Reported by J. G. Roberts.

Two lots were lower than the 99.5% standard, assaying 97.2 and 98.4%, respectively. Reported by L. H. Glickman.

*Sodium Sulphite*.—The only lot examined was 2.14% low in strength. It also was dark in color and was too alkaline in reaction. Reported by J. G. Roberts.

*Spigelia*.—An improvement is noted in the quality of Spigelia, as one lot contained only a few foreign roots. The other two lots contained only about one and two percent, respectively, of Ruellia. Reported by J. G. Roberts.

*Stramonium Leaves*.—Sixteen lots were examined, fourteen of which were of U. S. P. strength. The others contained 0.19% and 0.23%, respectively, of mydriatic alkaloids. Reported by J. G. Roberts.

*Stramonium Seed*.—Both lots were slightly below standard and yielded 0.28% and 0.29% of mydriatic alkaloids. Reported by J. G. Roberts.

*Strontium Peroxide*.—One lot assayed only 69.2% absolute  $\text{SrO}_2$ , which is below the 84.5% stated by the N. & N. R. for a good product. Reported by N. Saito.

*Terra Alba*.—The trade still differs as to what the composition of Terra Alba should be. Most of the lots examined were Calcium Sulphate, but one lot was clay, another lot was clay with much calcium sulphate and another lot was clay with a little calcium sulphate. Reported by G. E'We.

*Thyroid Glands* (Powdered).—The following amounts of iodine were found in several lots examined: 0.029%, 0.0587%, 0.044%, 0.065%, 0.18% and 0.19%. It can be readily seen that the last two are the only lots that will meet the iodine standard of 0.17% to 0.23% proposed for the next U. S. P. Reported by J. G. Roberts.

*Pinus Maritima*.—A steam distillation of this substance yielded about 10% of an oil having

an optical rotation of  $-30^{\circ} 31'$  and a specific gravity of 0.868 at  $25^{\circ}$  C. Reported by J. G. Roberts.

*Wild Cherry Bark*.—About 50% of old reddish-brown undesirable bark was found in one lot. Reported by J. G. Roberts.

*Zinc Oxide*.—Three lots which complied with all the U. S. P. requirements contained 0.21%, 0.275% and 0.196% of lead calculated as lead oxide. Reported by J. G. Roberts.

The following table shows the results of 133 crude drug assays made in the Analytical Laboratory of the H. K. Mulford Co. during the year June 1, 1914, to June 1, 1915:

DRUG	No. of Samples	Lowest Assay	Highest Assay	Average	Standard	No. Above Standard	No. Below Standard
Aconite Leaves .....	1	0.355	0.355	0.355	0.2% ether soluble alkaloids .....	1	0
Aconite Root.....	5	0.360	0.625	0.497	0.5% ether soluble alkaloids .....	2	3
Belladonna Leaves ...	3	0.247	0.350	0.300	0.3% mydriatic alkaloids .....	2	1
Belladonna Root .....	7	0.424	0.640	0.511	0.45% mydriatic alkaloids .....	5	2
Cantharides, Chinese..	6	0.570	1.10	0.869	0.6% cantharidin ...	5	1
Cantharides, Russian..	1	0.625	0.625	0.625	0.6% cantharidin ...	1	0
Capsicum .....	6	13.85	20.84	16.65	10% oleoresin .....	6	0
Cinchona, Red .....	1	8.35	8.35	8.35	5% total anhydrous alkaloids .....	1	0
Cinchona, Yellow .....	10	6.50	11.00	8.56	5% total anhydrous alkaloids .....	10	0
Coca Leaves .....	1	1.053	1.053	1.053	0.5% ether soluble alkaloids .....	1	0
Colchicum Seed .....	3	0.660	0.850	0.780	0.45% colchicine...	3	0
Digitalis .....	2	0.293	0.365	0.329	0.25% digitoxin...	2	0
Ergot .....	6	0.115	0.380	0.256	0.15% cornutine...	4	2
Gelsemium .....	4	0.503	0.849	0.630	0.4 alkaloids.....	4	0
Ginger, African .....	2	7.99	8.90	8.44	6% oleoresin.....	2	0
Ginger, Jamaica .....	1	3.93	3.93	3.93	4% oleoresin.....	0	1
Hydrastis .....	5	3.16	3.98	3.63	2.5% hydrastine...	5	0
Hyoscyamus .....	20	0.031	0.140	0.073	0.08% mydriatic alkaloids .....	6	14

Last year the drugs running habitually below standard were Aconite Root, Calabar Bean, Hyoscyamus, Jalap, Mandrake and Nux Vomica.

This year Aconite Root, Hyoscyamus and Nux Vomica are running low.

The Smith, Kline and French Co. found that Hyoscyamus, Nux Vomica and Stramonium Seed were generally below standard.

Respectfully submitted,

COMMITTEE ON DRUG MARKET,

J. G. ROBERTS, Acting Chairman,

CHAS. E. VANDERKLEEF,

HENRY C. BLAIR,

D. M. KRAUSER.

SUGGESTIONS FOR A COURSE IN MICRO-ANALYSIS AND BACTERIOLOGY FOR COLLEGES OF PHARMACY.

ALBERT SCHNEIDER.

(Concluded from July.)

The following blank report sheets should be used. The sample reports given will indicate how these are to be filled out based upon the results of the analysis:

Form No. 1. Blank report sheet for the microscopical examination of organic drugs and dry food substances.

No. (I. S. Laboratory or other serial number).

Label .....

.....

Sample received.....Sample examined.....

Conditions of wrappings and seals .....

Organoleptic tests .....

Consistency of Feel.....

Color .....

Odor .....

Taste .....

The following is a sample report of analysis using the proposed report card:

No.: 5432.

Label: *Broken Senna, U. S. P., John Smith & Co., Kalamazoo, Michigan.*

Sample received: *August 15, 1912.* Sample examined: *August 20, 1912.* \*

Conditions of wrappings and seals: *Good.*

Organoleptic Tests .....  
 Consistency or Feel: *Dry, gritty, sandy, dirty.*  
 Color: *Not unusual.*  
 Odor: *Senna-like.*  
 Taste: *Sandy, gritty.*

Adjunct Tests .....  
 Ash: *19.6%.*  
 Acid-insoluble: *9.4%.*  
 Sand (beaker test): *9%, sand and small pebbles.*

Special Tests: *Pebbles picked out by hand. About 4% senna seeds and pod fragments and stems present.*

Microscopical Findings: *The histological characters of African senna. Stem tissue excessive. Sand and dirt excessive. Senna seeds and pods present in considerable quantity.*

Conclusions: *Adulterated with sand, pebbles, senna seeds, senna pods and stems 25%. Misbranded because labeled U. S. P., whereas it is below the U. S. P. standard.*

RICHARD ROE, Analyst.

Form No. 11. Blank report sheet for the microscopical examination of catsups, jams, jellies, etc.:

(No., label, dates, condition of seal and organoleptic tests, as for Form No. 1.)

Adjunct Tests.  
 Sublimation tests for.....  
 Benzoic acid .....  
 Salicylic acid .....  
 Boric acid (curcuma thread).....  
 Iodine reaction .....  
 Intracellular .....  
 Extracellular .....

Special Tests .....  
 .....  
 Microscopical Findings.

General .....  
 .....  
 .....

Cytometric counts.  
 Dead yeast cells.....per cc.  
 Living yeast cells.....per cc.  
 Bacteria .....per cc.  
 Mold (hyphal fragments and clusters).....per cc.  
 Mold spores .....per cc.

Conclusions .....  
 .....  
 .....Analyst.

We may give an example of a report as follows:

FORM No. II.

Lab. No. 462.

Label: *Pure currant jelly. Made by Smith, Jones & Co., Nantucket, Wis.*

Sample received *August 5, 1914.* Sample examined *August 5, 1914.*

Condition of seals: *Good, unbroken sample.*

Organoleptic tests: *Not conclusive.*

Consistency or feel: *Poorly jellied.*

Color: *Normal for Currant jelly.*

Odor: *Faint, somewhat disagreeable.*

Taste: *Not characteristic, bitterish, quite acid.*

Adjunct tests.

Sublimation tests for

Benzoic acid: *Negative.*

Salicylic acid: *Very marked.*

Boric acid (cureuma thread): *Negative.*

Iodine reaction: *Very marked.*

Intracellular: *Negative.*

Extracellular: *Positive, very marked.*

Special tests: *Salicylic acid color reaction, with ferric chloride very marked.*

Microscopical examination.

General. *Some apple tissue (window cells and pulp cells) and currant tissue sclerenchyma present. Added wheat starch about 5 percent.*

Cytometric counts.

Dead yeast cells, 80,000,000.....per cc.

Living yeast cells, *none*.....per cc.

Bacteria, 600,000,000 .....per cc.

Mold (hyphal fragments and clusters), 84,000.....per cc.

Mold spores, 5,000,000.....per cc.

Smut spores, *none*.....per cc.

Conclusions: *Misbranded. Adulterated with apple and with wheat starch and made from fermented and decomposed material, preserved with salicylic acid. Not fit for human consumption because of the quantity of yeast, mold and bacteria present.*

JOHN DOE, Analyst.

Part II. Bacteriological.—Quantitative and Qualitative Determinations of Organisms in Foods and Drugs.

A laboratory course of at least one hour each day extending throughout the entire college year. The time necessary to do the laboratory work will vary from day to day. The work is to be supplemented by lectures, special reading and seminar work. The laboratory methods employed are those of the Laboratory Section of the American Public Health Association, The U. S. Public Health Service and the Bureau of Chemistry of the U. S. Department of Agriculture, in-so-far as these methods are applicable.

I. Substances to be analyzed

1. Liquids of all kinds.
2. Semiliquids and semisolids miscible with water.
3. Solids of all kinds.

II. Numerical and quantitative limits of contamination in different substances

1. For molds—quantity of spores and hyphae.
2. For yeasts—number and kind.
3. For bacteria—number and kind.
4. For pus, dirt, sand, etc.

## III. Methods.

1. Making concentrations.
2. Making dilutions.
3. Making the counts and estimates.
  - a. Bacteria.
  - b. Yeasts.
  - c. Mold spores and mold hyphæ.
  - d. Algæ, in drinking waters, etc.
  - e. Protozoa.
  - f. Pus cells, in milk, etc.
  - g. Dirt, sand, etc.
4. Plate counts—Petri dish cultures.
  - a. Culture media used.
  - b. Optimum temperature.
  - c. Time of incubation.

## IV. Qualitative determinations.

1. Apparatus.
2. Culture media.
3. Stains.
4. Special methods.
  - a. Colon group of bacilli.
  - b. Presumptive colon bacillus test.
  - c. Sewage streptococci.
  - d. Dysentery bacilli and amoebæ.
  - e. *Bacillus typhosus*.
  - f. Paratyphoid group.
  - g. *Cholera vibrio*.
  - h. Yeasts.
  - i. Molds.
  - j. Animal parasites.
  - k. Larvæ, ovæ, etc.

## V. Biological water analysis.

1. Bacteria, number and kind.
2. Diatoms.
3. Desmids.
4. *Nostoc*.
5. Other algæ.
6. Molds; significance of.
7. Evidence of soil and sewage contamination.

## VI. Bacteriological milk analysis.

1. Quantitative.
  - a. Standards for different geographic areas.
  - b. Summer and winter standards—temperature standards.
2. Qualitative.
3. Pus and blood corpuscles; significance of.
4. Milk diseases.
  - a. Blue milk.
  - b. Ropy milk.
  - c. Bad odors, bad taste, etc.
5. Sour milk.
6. "Buttermilk" tablets.
7. Kefir, koumys, etc.

## VII. Bacteriological Examination of Shellfish.

1. Selection of sample.
2. Making a record of the sample.
3. Transportation of the sample.
4. Laboratory procedure.
5. Bacterial counts.
6. Determining bacteria of the colon bacillus group.
7. Statement of results. Rating.

## VIII. The Bacteriological and Toxicological Examination of Meat and Meat Products.

1. Direct microscopical examination of meats.
  - a. Bacteria on the surface of meats.
  - b. Mold and mold spores, as in moldy bacon, pork, fish, etc.
  - c. Presence of bladder worm, larvae of parasites, etc.
  - d. Trichinæ in pork and examination for trichinæ.
  - e. Cereal fillers and starches in sausage meats.
  - f. Preservatives and coloring substances in meats.
2. Plate cultures.
  - a. Numerical counts of bacteria.
  - b. Number of gas formers and of acid formers.
  - c. *Bacillus botulinus* in pork. Botulism.
3. Toxicological tests.
  - a. Inoculation tests (Guinea pigs) to prove the absence or presence of toxins or ptomaines.
  - b. Tests for tuberculous meats and for the tubercle bacillus.
4. Biological Tests. Determining the Source of the Meat.
  - a. Sugar test for horse meat.
  - b. The precipitin test for meats from different animals.
  - c. Microscopical examination of tissues, fats, fat crystals, etc.

## IX. The Bacteriological Examination of Eggs and Egg Products.

1. Direct microscopical examination.
  - a. Bacteria.
  - b. Molds.
  - c. Mold spores.
2. Plating methods.
3. Egg tests.
  - a. Candling.
  - b. Brine test.
  - c. Organoleptic tests, etc.
4. Evaporated eggs.
5. Cold storage eggs, etc.

## X. Bacteriological Examination of Pharmaceutical Products.

1. Direct microscopical examination
  - a. Bacteria.
  - b. Molds.
  - c. Mold spores.
  - d. Yeasts.
2. Plating methods.
3. Colon bacillus test.
4. Tetanus bacillus test.
5. Tests for the staphylococcus and streptococcus groups.

## XI. The Microscopical and Bacteriological Examination of Syrups.

1. Medicinal syrups.
  - a. Official, simple and medicated.
  - b. Patent and proprietary medicated syrups.
  - c. Medicinal preparations containing syrup.
2. Soda fountain syrups.
3. Fruit juices containing sugar. Fruit juice concentrates.
4. Syrups, molasses, treacle, corn syrup, etc.

## XII. The Microscopical and Bacteriological Examination of Fermented Foods and Drinks.

1. Whisky and brandy.
2. Beer. Beer diseases.
3. Wines. Wine diseases.
4. Other fermented drinks.
  - a. Sake or Japanese rice wine.
  - b. Arrak.
  - c. Yoghurt.
  - d. Kephir.
  - e. Koumiss.
  - f. Soja sauce.
  - g. Mazun.
  - h. Leban.
  - i. Ginger beer.
  - j. Beebe wine.

## XIII. The Bacteriological Examination of Mineral Waters.

1. Examination of centrifugalized sediments.
2. Plating methods.
3. Presumptive colon bacillus test.

## XIV. Determining the Efficiency Value of Disinfectants.

1. Phenol germ destroying coefficient.
2. Toxic Coefficient.
3. Albumen coagulating coefficient.
4. Comparative cost.

## XV. Determining the Purity and Quality of Sera, Bacterins and of Related Products.

1. Purity and freedom from bacteriological contamination.
2. The purity of smallpox vaccines.
3. Purity of bacterial vaccines.

## XVI. Special Biological and Toxicological Tests.

1. Arsenic in foods. Biological test for arsenic.
2. Toxicity tests with defibrinated blood.
  - a. Toxalbumins and toxins.
  - b. Saponins.
  - c. Chemical hemolysis.
3. Frog tests for the presence of alkaloids.

The following report blank will be found useful in making reports of bacteriological examinations. In many instances however, it will be found necessary to supplement the report or to make a special report.

## FORM No. III.

## Bacteriological Examination.

(No., label, dates, condition of seals as for Form I.)

WHITE MINERAL OILS, AMERICAN—PARAFFINUM LIQUIDUM—  
LIQUID PETROLATUM.

S. L. HILTON.

White Mineral Oils, or Paraffinum Liquidum, U. S. P. now on the American market are of American refining, for the reason that the Russian oils are unobtainable owing to various causes incident to the European War. A fact, not generally known, was that while these oils were made from crude material obtained in the Baku district they were not refined there and the processes of refining are held secret.

The Russian crude product differs chemically from that found in America, consequently, it has been necessary to devise and develop new processes that were applicable to refining and purifying the crude American product so as to be able to furnish an oil of similar character as the Russian, for internal administration, that would give equally as good results in intestinal stasis.

The requirements of the British Pharmacopœia are more exacting than required by the U. S. P. VIII. Not only the U. S. P. IX, when issued, will be as exacting; the standard that I have followed in the examination of these oils is that of the British Pharmacopœia.

An oil containing an appreciable amount of unsaturated hydrocarbons when taken internally will result in chemical action in the digestive tract, generating gases and having a similar action to that of castor or croton oils, which is not

desired. The work of Dr. Lane was with an oil free from unsaturated hydrocarbons, of a rather heavy specific gravity, so that its action would be mechanical entirely. This is the oil that is desired and the one that has been used abroad and in this country for some time. With the disappearance of the Russian oil from the market, it has become necessary for American refiners to study the question and devise processes to properly purify and refine the American crude product obtainable, of quite a different character, so as to furnish an oil of high purity, free from unsaturated hydrocarbons, that would take the place of the foreign product now unobtainable. This the American refiners seem to have accomplished and they will no doubt further improve their products, after gaining more experience with the processes they have devised for purifying and refining.

An examination of fifteen different samples of American oils now on the market shows varying results, those suitable for internal administration when subjected to a temperature of  $-4^{\circ}$  C. for 4 hours are nearly or quite solid, some of them will show a distinct cloudiness with the slightest change of temperature. Another characteristic of the American oils is that they are generally of lighter specific gravity than the Russian oils, due evidently to the fact that they are obtained from material of a different chemical composition. The Russian oil is obtained from the crude product consisting chiefly of monocyclic polymethanes or naphthenes having a general formula  $C_nH_{2n}$ . The American crude oil is obtained from paraffin base petroleums and consists chiefly of hydrocarbons of the methane series having the general formula of  $C_nH_{2n+2}$ .

Richter makes the statement that paraffins are more abundant in petroleum from the Baku district than that found in America; my observations are to the contrary. In a comparison of experiments I made in February 1914, with those made at this time, I find that the American oils show decidedly more heavy paraffins than the Russian oils. I see no reason why this should affect the quality of the American oil or interfere in any way with its use for internal administration, provided they are saturated hydrocarbons. This can be readily determined by applying the sulphuric acid test; the showing of more than a pale brown color, after properly conducting the test as prescribed by the British Pharmacopoeia, is sufficient grounds to reject the oil for internal administration.

After completing the examination as shown by the tabulated statement, I placed samples of the oils I considered best, in the hands of several physicians for experimentation and comparison of results they had previously obtained with Russian oils. In every case I have had most favorable reports and they have informed me that they were unable to notice any difference whatever in its action. I have therefore come to the conclusion that our American oils, when properly purified and refined, so that they are free from taste, odor and unsaturated hydrocarbons, that are water-white and with a specific gravity of at least .840 at  $15^{\circ}$  C., will answer every purpose that is desired and will give equally good results as the Russian oils when taken internally.

I herewith append tabulated statement showing the results obtained. Samples 1, 4, 5, 6, 7, 9, 10, 12, and 15 conform to the requirements of the British Pharmacopoeia, which standard is more rigid than that required by the U. S. P. VIII. These oils are adapted for internal administration.

## LIQUID PETROLATUM\*.

---

JOSEPH P. REMINGTON.

---

The war in Europe has caused considerable difficulty in obtaining Liquid Petrolatum of the quality suited for internal administration.

The great demand for this liquid has, of course, stimulated American manufacturers of petroleum products to produce an article equal to the "Russian Mineral Oil" as it is called.

It has been stated that the latter, owing to its having been procured from oils of the naphthene series possesses qualities which fit it for internal use, while the American Oil, being obtained from the methane series, cannot be refined so as to produce an article equal to the Russian Oil. Attempts have been made from time to time, during the last few years, in this direction but so far with varying success.

An American Oil is coming into use and undoubtedly a way will be found to solve the problem. The points which at present are dwelt upon are these: Specific gravity, viscosity, freedom from taste, absence of sulphur, and fluorescence.

*Specific Gravity.*—The question of specific gravity need not be vital. It appears that the oil from American source is of a lower specific gravity than that furnished from the Russian sources. Medical writers on the subject insist upon a heavy oil, but if the other requirements are thoroughly carried out, a wider range of admitting oils of lower specific gravity could be directed by the Pharmacopœia.

*Viscosity.*—The degree of viscosity seems to be of more importance than specific gravity. For oils to be used for internal use, a high degree of viscosity is believed to produce an oil which will not cause leakage through the rectum. On the other hand, some medical authorities believe that viscosity has nothing whatever to do with leakage, but that this is due to the patient using an excess. The manufacturers are trying hard to satisfy the requirements for viscosity and some are succeeding.

*Freedom from taste* is, in the writer's opinion, of the greatest importance, and to produce an oil fully meeting this requirement causes the manufacturer more trouble than anything else. Americans almost universally dislike the taste of coal oil and when the slightest amount of sulphur is present, hydrogen sulphide or similar compounds are produced in the stomach and the disagreeable taste of the eructations renders the product unsalable, and its rotten egg flavor is unbearable.

*Fluorescence.*—The property which some liquids possess of emitting colors while light is being passed through them, in other words fluorescence, is regarded by dealers as one of the best practical tests to determine a proper degree of refinement. Fluorescent oils are rejected because this quality is believed to indicate lack of purity. Whether a slight fluorescence is a disadvantage medicinally, provided the oil is tasteless, is yet a question to be determined. In the work of revision of the Pharmacopœia, many samples have been submitted to the writer and the fact stands out prominently that samples of oils of American manufacture have with

---

\* Read at the meeting of the Pennsylvania Pharmaceutical Association, June, 1915.

few exceptions *failed to retain* the properties of tastelessness and freedom from odor. There is also a tendency to become yellowish or yellowish-brown in time. It would seem from some experiments which have been made that exposure to direct sunlight causes discoloration. This is remarkable because exposure to sunlight has been regarded for centuries as inducing a bleaching or decolorizing effect on most substances. At present it would seem that manufacturers of American oil have not entirely mastered the problems of purification.

At present buyers of American Liquid Petrolatum should be cautious about laying in a stock of the Oil in large lots, for they are likely to find that the last portions have acquired properties which will render it unsalable, since the slightest coal oil taste makes it unfit for internal administration.

The writer has faith in the American manufacturers' ability to overcome these defects and the greatest encouragement should be given them to produce an American Oil suitable for all purposes.

The new Pharmacopoeia will cover these points by appropriate tests. The sulphuric acid test to determine the presence of carbonizable impurities; the lead oxide test for sulphur compounds; a test for absence of acidity or alkalinity, and the physical tests to determine the tastelessness and freedom from odor and fluorescence will be given. A light Liquid Petrolatum will also be official, for use in atomizers and nebulizers.

The definition will be changed simply to read, "A mixture of liquid hydrocarbons" as it is unnecessary to specify the source from which it is derived, either the methane or naphthene series.

### FATS AND OILS.\*

The Adaptability of the Röse-Gottlieb Method for the Estimation of Fat and Oil in Certain Pharmaceutical Preparations.

CHARLES A. HACKMAN, F. I. C.

Judging from statements recorded in past numbers of this journal (*Chemist and Druggist*), it does not appear to be generally known that the Röse-Gottlieb method affords the most rapid and accurate means for the determination of oil in many pharmaceutical materials and preparations. For example, the estimation of oil in cod liver oil and malt presents many difficulties,

when the usual method of extraction with immiscible solvents is attempted; but with the Röse-Gottlieb method, suitably adapted, these difficulties are readily overcome, and the present note has been written with a view to drawing attention to the excellence and wide adaptability of the process. Originally designed by Gottlieb for the estimation of fat in milk (*Analyst*, 1898, 259), and subsequently modified by Röse, the method was prominently brought before analysts by H. Droop Richmond in "The Analyst" for October, 1908, p. 389. In

that communication its suitability for the estimation of fat in dried milks was

\* *Chemist and Druggist*, July 3, 1915.

especially pointed out, and in concluding his paper the author made the following remarks:

"The method is so convenient, accurate, and rapid, that I now use it in preference to all others for the analysis of milk (of which 5 cc. is taken and no water added) and all milk-products; it is also applicable to the analysis of eggs, egg-yolk, and dried egg-preparations, provided the quantities taken are not too large." Continued and extended use of the process for many years enables the writer of this note to confirm the above remarks in every particular, and for the benefit of those who have, perhaps, hitherto regarded the method as applicable only to milk, a detailed description of its working is here appended. The apparatus required is of the simplest description, and consists of Fig. 1, a narrow, accurately stoppered tube, approximately 7 in. high and 1 in. wide; Fig. 2, a cork to fit this tube carrying thin wash-bottle tubes; and Fig. 3, a light glass flask, and (4) a condenser. The reagents used are (1) solution of ammonia (0.880 ammonia diluted with an equal volume of water), (2) absolute alcohol, (3) ether (sp. gr.=0.720), and (4) petroleum ether (boiling point below 60° C.).

The details of procedure in the case of milk are as follows:

The tube, without its stopper, is first accurately weighed; 5 cc. of the sample is then pipetted in, and the whole weighed again, the difference giving the exact weight taken. Next 0.5 cc. of the ammonia solution is run into the tube, followed by 5.0 cc. of alcohol, and the whole thoroughly mixed. Then 12.5 cc. of ether (measured out in a small cylinder) is added in approximately 5 cc. quantities at a time, holding the tube in the right hand and imparting to it a rotary motion after each addition in order to secure thorough admixture. A similar quantity (12.5 cc) of petroleum ether, measured in the same way, is finally added and mixed. The tube, with the stopper loosely in position, is placed in a water-bath containing lukewarm water and gently rotated until the ether-vapour just commences to escape and condenses around the ground-in portion of the stopper. As soon as this happens the stopper is pushed home, and the tube and its contents are cooled under the tap. After gently inverting once or twice, the tube may either be set aside for the mixed layer to separate, or preferably "whirled" immediately in a centrifuge until this separation is complete.

The stopper is now cautiously withdrawn, and its underside rinsed off into the tube with a few cubic centimeters of mixed ethers contained in a small wash-bottle. The use of the warm-water bath employed above is apparent at this stage, since the slight vacuum produced prevents any of the contents of the tube being ejected—as would otherwise be the case—when the stopper is withdrawn. The cork carrying the wash-bottle tubes is now inserted in the place of the stopper, and the long tube adjusted until it is about one-fourth inch above the line of demarcation of the two liquids. On applying gentle pressure to the shorter tube, either by the mouth or by means of a small pressure-tank provided with a finely acting valve, the whole of the ethereal layer is blown off into the light glass flask. The cork is next carefully removed, the outside of the longer wash-bottle tube rinsed back into the Gottlieb tube, 25 cc. of mixed ethers added, the process described above repeated in exactly the same manner and the separated ethereal layer again blown off into the flask containing the first portion.

In the case of milk two "blow-offs" are sufficient, but in some substances richer in fat or oil three or even four are necessary.

The thin glass flask containing the united ethereal extracts is now attached to a condenser and the mixed ethers are distilled off. After detaching the flask the residual alcoholic and ether is blown off by means of a current of air, and the residue dried to constant weight in the water-oven. The fat is next dissolved in a little petrolatum ether and cautiously decanted from any insoluble residue. After several rinsings to remove the whole of the fat, the flask is again dried and weighed, the difference between the two weighings giving the amount of fat in the weight of sample taken.

In adapting this process to substances other than milk it is important to keep the relative proportions between the water and immiscible solvents constant, and to secure thorough admixture of each reagent. Thus in the case of extract of malt with cod-liver oil a weighed quantity approximating to 1 gram is taken and dissolved in sufficient warm water to occupy 5 cc. The remaining procedure is then as described above. For all emulsions the process will also be found eminently suitable. The estimation of the proportion of cacao-butter in cacao and chocolate is possibly of minor importance to pharmacists, but the Röse-Gottlieb process in the hands of the writer, employed with slight modification in the order of adding the reagents, has proved the quickest and most accurate process for this estimation that is known to him.

---

#### LIMITATIONS OF THE REACTION WITH NINHYDRIN.

Current medical literature bears witness to the interest which has attached quite recently to the triketohydrinden reaction, more popularly known by the name of ninhydrin reaction. Until very lately it has been regarded as a characteristic test for amino-acids or compounds of them, and consequently has found a wide application in some of the modern serum reactions, such as those introduced by Abderhalden in relation to pregnancy, cancer, etc. In view of the growing use of the reagent, it deserves to be pointed out that many substances which in no sense exhibit a combination of amino and carboxyl groups, as do the amino-acids and proteins, nevertheless give a characteristic reaction. Amines, amino-aldehyds, aminosulphonic acids, urea derivatives and certain organic acids may be mentioned in illustration of this statement. To these known exceptions Neuberg has added a new series of both organic and inorganic substances, some of which might lead to deception in respect to the reaction. It would be of little advantage to recite here this list of compounds, which the specialist in this field should learn at first hand. Perhaps it is worthy of mention, however, that a minimal putrefactive change in proteins is sufficient to provoke the appearance of substances which give a strongly positive test with the ninhydrin reagent. They are presumably putrefactive bases which are in part of a volatile nature. These facts point to the necessity of caution in the interpretation of findings based on the use of the ninhydrin test. *Journal A. M. A.*

ETHICS OF BUSINESS.\*

---

With the rapid mode of transportation, with the advanced system of communication, with the improved methods of manufacture, with the many labor-saving inventions, business is making head.

By keeping pace with the scientific achievements of the times, business has demonstrated that it is not a theory. It is a reality built upon efficiency, intelligence and enthusiasm.

In former years, the young man who was not fitted for a profession was usually placed in business. Today this has changed, for this is an age of method and concentrated energy. And unless he is especially trained for the work, he is doomed to disappointment and failure. He must know one thing and know it absolutely, if he is to meet with material success and commercial supremacy. He must have the faculty of concentration. He must give prompt, active and constant service. He must handle his day's complex work on a schedule as exact as a railroad time-table. Enthusiasm and initiative are essential to success. Initiative requires alertness and originality. It is creative and constructive. Enthusiasm is the inspiration, the force, the propelling motor that pumps life into every successful business.

Business must have facts instead of fiction, figures instead of guesses, information instead of experiments, results instead of speculations. Big business is run and financed upon positive information, by detailed records, by charts and statistics. It is governed entirely from tabulated sheets; its judgments are formed by the rule of percentage; its opinions are based upon figures and facts; operations are planned by units and volumes. Commercial leaders think and act in dollars and cents. Nothing is left to luck or chance.

The most successful careers are those that are shaped by their own hands, that are run on conservative lines, and maintained by cautious and prudent principles. This is the method most highly regarded by the business world today. Business cannot be negative. It must be either a success or a failure.

All of us are more or less dependent upon our neighbors for existence. In the beginning men with rudely-formed weapons issued from their caves to kill the wild beasts of the forest. These were to supply them with food and clothing. But as time went on, certain people were able to kill more than others, while some became more proficient in curing skins and pelts. Thus exchange became necessary, and trade was born.

## INTERDEPENDENCY.

Today it is not possible for a nation or even an individual to be independent, because the materials from which the necessities of life are made, come from widely separated sections and countries. Hence came the necessity of railroads and steamships. These are the agencies of commerce. Through these channels we secure food, clothing and shelter. These are the primal wants of man. As civilization advances, nations become more and more dependent upon one another. Consequently, commerce becomes one of the greatest factors in modern business.

---

\* Parts of an article by Isaac Schnewind in *The Fra.* March, 1915.

The one great curse of business is overproduction. The tendencies are to push business to its utmost limit and then try to find a market for the increased production. Manufacturers have gone on expanding until the markets have become overstocked. Then comes the unloading—the bottom falls out, and the crash is heard in all parts of the industrial world. Long ago business men recognized that the world is a large community, and causes and effects in one country will find their reflex in all others. Thus we see that those who till the soil find that the price of their product is fixed in the world markets.

#### ORGANIZATION.

The tendency of modern business is towards organization and economy. In hundreds of industries the profits of today are wrung from the waste and the refuse of former days.

Business to be successful must have normal profits. Continuous sacrificing of profits ultimately means failure. When the supply and demand are equalized, then business will be done at a profit. The safe and sound method shows that decreased business with normal profits is better than increased business with no profits. The foreigner realizes this. He first looks to profit. If he cannot obtain it in one market he seeks it in another. This is the chief reason why English and German manufacturers have done business in every market of the world. But most of our concerns go on wondering and blundering.

Competition, which is the desire to excel, is universal. In every sphere of human activity, competition is essential for securing the best results. Formerly competition was the life of trade—today competition is the death of trade. Competition solely of price and not quality is "cut-throat" competition. But in the public mind the fierce price competition is still the basis of industrial progress.

In many branches of trade it has been war to the knife, until some of the biggest and strongest concerns have fallen by the wayside. By unfair competition an irreparable damage is done to the textile industry, by the so-called "world-beaters." This is an article sold so cheaply that no competitor is supposed to meet the price. But this very act forces other houses to make unwarranted concessions, and in the end shows a loss to all concerned. When competition forces the price below the cost of production, it becomes destructive. Competition became fatal when machines were invented whereby production exceeded the immediate demand. We need look only into the large number of retirements from business to understand what such competition means.

#### CO-OPERATIVE COMPETITION.

Business transactions should be profitable to both buyer and seller. And this condition would exist if we cease this unfair competition which prevails in America.

Co-operative competition should be the motto of every business man. Co-operation on the "live and let live" plan will be the sensible policy of the future. Foolish men compete—wise men co-operate.

To be successful one must be his own chemist and analyze his own case. He must eliminate negative factors; he must sift, sort and strengthen his men and methods. For when business dies the nations perish. Greece started her down-

ward course when she began giving her subjects something for nothing. A pension was devised for every citizen, but the nation became bankrupt. Rome had the same policy. She gave free shows, free entertainments and finally free bread. Then Rome fell.

"Profit-sharing limited to the sharing of profits of successful years, without any responsibilities for the losses of unsuccessful years, is certainly unfair." The system that couples responsibilities with liabilities is more equitable. Unrest in industry is worldwide and is caused by a desire for better conditions. The progressive man constantly works for human betterment. He is always building, extending, improving. Unrest is the sign of progress. Better food, better health, better clothing, better housing and better education is the cry of civilization.

Plato says, "The origin of wars is the pursuit of wealth, and we are forced to pursue wealth because we live in slavery of what wealth buys." Money is only the measure of power. Money for its own sake is not worth the struggle. When money minimizes brains, when it makes men feel that they can buy their way through, when money is the beginning and end of everything, then it nullifies the human element, and sooner or later the stoutest ship must go under.

---

#### A NEW IMMUNIZATION THEORY.

According to a new theory of immunization against bacterial disease evolved by Drs. Henry Smith Williams and James Wallace Beveridge, two New York physicians, the red and white corpuscles of the blood are the chief agents that protect human organisms against the ravages of bacteria, and this they have termed the proteomorphic theory. These investigators believe that the white corpuscles deal with the unbroken proteins that they may come in contact with, whether they be of bacterial or dietetic origin, and that the red corpuscles deal with the partially cleaved molecules of protein. In other words, the business of the white corpuscle is to break down or cleave this protein molecule, not synthesize it. And in summing up *American Medicine* condenses their statement: "In this view, then, the red blood corpuscles have an immunizing function strictly complementary to that of the white blood corpuscles, and no less important. One legion of cells co-operates with the other, each having its own special field. The white corpuscle deals with all formed bodies and full-sized protein molecules of foreign type that make their way into the blood stream. The red blood corpuscle deals with the latter cleavage products of protoplasmic activity. In carrying out their respective tasks, the leucocyte supplements the work of the ferments of the digestive tract; the red corpuscle supplements the work of the leucocyte and relieves the ultimate tissues in considerable measure of the task of protecting themselves against small-moleculed nitrogen products that might prove harmful."—*Journal A. M. A.*

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished reprints by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.

200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.

50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.

100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.

200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.

50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.

100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.

200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

## THREE DECEASED PHARMACISTS WHO CONTRIBUTED TO THE HIS- TORY OF AMERICAN PHARMACY.

F. W. Meissner, of LaPorte, Ind., has donated two photo postal cards to the Historical Section of the A. Ph. A. One of Leo

Leo Eliel, Charles E. Dohme—Dr. F. Hoffman.

Eliel at work, and the other conveying greetings and a message to him from Fr. Hoffmann and Charles E. Dohme.

The card was dated May 17, 1902, at Wiesbaden, and expresses the wish that both of these beloved and distinguished pharmacists would attend the meeting in Philadelphia that year. Health prohibited the attendance of Dr. Hoffmann, but he sent his valuable address, prepared for the semi-centennial meeting entitled, "A Retrospect of the Development of American Pharmacy and the American Pharmaceutical Association."

### GLUE FOR GAS TUBING.

In Germany solidified glue is now manufactured into tubing, substituting rubber. The Technische Monatshefte of April 10th, states that for some purposes this tubing is superior to rubber, more impervious to gases and more resistant to heat. It is claimed that this material will not deteriorate as quickly as rubber and when suitably encased will withstand a high pressure.

The cost is given at sixty pfennigs per meter and is sold under the trade name of Sonjatin. Professor J. Trube is the inventor and he makes the statement that this new composition is peculiarly suited for conductors of petroleum and gasoline as well as gases, but is attacked by water. The latter fact presents an objection and limits the use of the product.

**"THE DRUGGIST AND HIS PROFITS."**

Harry B. Mason, Editor of "The Bulletin of Pharmacy," has for quite a number of years made a close and intimate study of drug-store profits and has just published a book entitled, "The Druggist and His Profits," which deals with that very important part of the business.

The scientific study of the details of business has contributed to the modern store service. To compound a preparation is one thing, but to understand the chemistry involved, is another. So also in business, an intelligent understanding is necessary in order to anticipate profits or conduct it so that there is no uncertainty of results. The haphazard way of doing business, simply selling goods, is unscientific; in a successful business, a knowledge is required of the relation that obtains between the expense account and the volume of sales.

The book is interestingly written and goes into the details of business conduct without beclouding the scheme with unnecessary phraseology and impractical theories. In its fifteen chapters the production of profits is viewed from every angle and the subjects are discussed in a thorough, business-like manner. The lessons are taken from life, in other words, active businesses are analyzed; the methods presented are not presumptive, nor the remedies advised empirical.

It is unnecessary to say that there is no subject that confronts druggists or any other business men which has a greater importance than that of producing profits; hence in this work Mr. Mason has done a service which will doubtless be appreciated. E. G. E.

&lt;&gt;

New and Nonofficial Remedies, 1915, Containing Descriptions of the Articles which have been Accepted by the Council on Pharmacy and Chemistry of the American Medical Association prior to January 1, 1915. Chicago, 1915.

As suggested by the title this book contains more or less comprehensive descriptions of the composition, dosage, action and uses of and tests and requirements for the new and nonofficial remedies which have been examined by the Council on Pharmacy and Chemistry of the American Medical Association and which appear to comply with the rules of the Council. In submitting this publication the Council again emphasizes its

desire to have physicians and pharmacists understand that acceptance of an article does not necessarily mean a recommendation, but that so far as known the article complies with the requirements of the rules of the Council as printed in the introductory portion of the book. The Council also asks for criticisms and corrections to aid in the annual revision of the material contained in this volume. The present edition includes a total of 426 pages and XVI octavo pages and the material in a general way follows the precedent that has been established in previous volumes. The practice of classifying the several articles under general headings has been considerably elaborated on, a large number of new headings being included and some of the headings previously used extended so as to make them more useful for reference. In addition to the descriptions of new and nonofficial remedies, the book contains a reprint of the rules covering the admission of proprietary articles to the book, New and Nonofficial Remedies, with comments thereon, a general index of 34 pages, an index to manufacturers of products included in the book and a list of references to proprietary and unofficial remedies, not admitted to N. N. R. Altogether the book represents a volume of useful information that the up-to-date pharmacist or the wide-awake pharmaceutical chemist cannot well do without.

M. I. W.

&lt;&gt;

Annual Reprint of the Reports of the Council on Pharmacy and Chemistry of the American Medical Association for 1914, with the Comments that have appeared in the Journal. Press of the American Medical Association, Chicago, 1915.

This small octavo volume of 143 pages includes a collection of the reports of the Council on Pharmacy and Chemistry of the American Medical Association that have appeared during the year in the Journal of that Association, elaborated in some instances by the addition of records of analytical work or of other laboratory investigations which because of their technical nature had been omitted from the reports as published in the Journal. The complete reports are published so as to make the investigations available to chemists, pharmacologists and scientists in general who might be interested in medicine or who may have occasion to further investigate the

preparations or problems under discussion. In addition to critical reports on widely advertised proprietary preparations, this volume also contains a report on liquid petroleum or Russian mineral oil and references to a number of products that have been deleted from N. N. R. because of non-use or because the product is no longer marketed by the original manufacturer. As a report of progress and as a book of reference to investigations bearing on the use of proprietary medicines this volume will be a welcome addition to the reference book shelf of the active pharmacist or chemist. M. I. W.

&lt;&gt;

Annual Report of the Chemical Laboratory of the American Medical Association, January-December, 1914. Press of the American Medical Association, Chicago.

The reports included in this volume are given under three headings: (1) reports of contributions, (2) abstracts of reports, (3) reports not previously published. The object of the publication is to furnish to chemists, and to others who may be interested in drug analyses, readily available references as to work done in the chemical laboratory of the American Medical Association. The report includes a number of analyses of preparations of the "patent medicine type." Among the methods of analyses that should be of more than passing interest is a contribution by L. L. Warren on "The Detection of Emodin-bearing Drugs in the Presence of Phenolphthalein." This latter contribution is particularly interesting at the present time because of the number of preparations containing phenolphthalein that are being marketed usually without any suggestion that this particular product is present. M. I. W.

&lt;&gt;

#### THE HOMOGRADE THERMOMETER.

A new clinical thermometer scale is advocated and now in use, the thermometer being known as the "Homograde." The normal temperature is given as 100, but the measurement of the expansion or contraction is fixed by the Fahrenheit scale. Thus instead of one degree of temperature being indicated by 99.6, it is read on the new scale as 101. Doubtless this is a decided improvement, but why not adopt 0 degree as normal? Conversion can then at once be made by adding or deducting the degree indicated, thus a degree below normal which is minus 1

would correspond to 97.6 F. or plus 2 degrees to 101.6. To convert Homograde degrees to Fahrenheit requires that one-third be taken of that number and deducted from the degree Homograde and then 32 added. While easy enough it requires figuring. Thus deduct from 100 degrees Homograde  $33\frac{1}{3}$  leaves  $66\frac{2}{3}$ , add 32 gives  $98\frac{2}{3}$ . If 0 degree is used as normal then the figures would at once give the temperature above or below normal. Carrying the thought through, the 100 degree of the Homograde might, on account of long custom, unthinkingly be taken to indicate 1.4 degrees of temperature, while such error would not obtain in the suggested scale.

&lt;&gt;

#### THE HANBURY MEDALIST OF 1915.

Edward Morell Holmes, F. L. S., has been awarded the Hanbury Medal this year for high excellence in the prosecution of original research in the natural history of drugs. The jury of award were the Presidents of the Linnean,

Chemical and Pharmaceutical Societies of the British Pharmaceutical Conference and Mr. E. H. Farr.

The Hanbury Medalist was born at Wendover, England, in 1843, and at the age of 72 is still intensely active. In 1897 Mr. Holmes was awarded the Flueckiger Medal. By the expressed wish of the late Sir Thomas Hanbury, Mr. Holmes was asked to select for the Pharmaceutical Society Herbarium any or all plants of medicinal interest from the large Botanical Herbarium left by Daniel Hanbury; these he has catalogued for the Society.

Mr. Holmes has taken a great deal of interest in Chinese and Japanese drugs, procuring for the British Pharmaceutical Society specimens of the drugs of these countries from International Exhibitions. That the subject of this very brief sketch is a persistent worker is conclusive from a statement he has made, that it took him twenty years to fix the exact botanical source of genuine *Schizandra* and after the same length of time, definitely identified the plants yielding myrrh and Japanese acorn root. For

the last two British Pharmacopœias he has been the botanical referee, co-operating with the director of the Kew Gardens.

Mr. Holmes has always taken an active interest in pharmaceutical progress both from the commercial as well as scientific standpoint, and his thorough familiarity with the subject is substantiated by his article on Pharmacy in the Encyclopedia Britannica.

&lt;&gt;

#### PROCESS OF TOUGHENING ORDINARY FILTER PAPER.

There has been some difficulty in obtaining hardened filter paper. Wm. R. Rankin, after experimenting with various treatments, finds that the following will give good results:

Good filter paper is dipped in nitric acid sp. gr. 1.42, drained quickly and then placed in running water to remove most of the acid; then dipped in .5 percent ammonia water to completely neutralize all acid. The paper is next washed in running water and partially dried between blotting paper, and finally in a water oven at 100° C.; when dry, the paper is again subjected to the same process. In the treatment of the paper precaution must be exercised, as the cellulose of the paper has been nitrated, and if the temperature in drying the paper is too high, it is apt to char suddenly. The shrinkage of the paper amounts to about ten percent.

The paper so treated, has a hard, smooth surface and will permit a liquid to pass through very quickly, when used for filtration.

&lt;&gt;

#### CAROLINA JOURNAL OF PHARMACY.

Number 1, Volume I, of the Carolina Journal of Pharmacy has come from the press and from now on is to be issued quarterly. Prof. J. G. Beard is the editor and the Journal is published by the William Simpson Pharmaceutical Society of the University of North Carolina School of Pharmacy. A cut of William Simpson, forty-second President of the American Pharmaceutical Association, adorns the front page. The first number would indicate that the purpose is not only for developing greater interest among local pharmacists, but to be of general service to pharmacy, so the American Pharmaceutical Association is not overlooked and pharmacists of the state are urged to affiliate. A number of interesting and valuable articles are included in this issue, together with items

of more or less local interest. The publication is deserving of encouragement by North Carolina pharmacists, whose support is more particularly solicited.

&lt;&gt;

#### HYOSCYAMUS OF THE ANNUAL AND BIENNIAL.

The British Pharmacopœia fails to state whether hyoscyamus leaves of the annual or biennial should be employed. The definition given is for leaves of *Hyoscyamus niger*, collected from the flowering plants and dried. Tincture of hyoscyamus prepared from biennial leaves makes an opalescent or slightly milky solution with water while that of the annual makes a clear solution. A tincture prepared from official drug, according to definition may not always appear as the same preparation to the patient. E. M. Holmes points out the difference that may obtain, not only in the preparation, but with the drug of the market.

&lt;&gt;

#### RANCIDITY OF FATS.

Prof. Henry L. Smith contributes an article on Rancidity of Fats to the Pharmaceutical Journal and Pharmacist of July 3. While rancidity of fats is usually accompanied by increased acidity, there is no definite relation between acidity and the degree of rancidity. Conditions which conduce hydrolytic action also favor rancidity, which is generally caused by oxidation. Fats should be as free from moisture as possible, be protected from light and the influence of air, but this does not insure protection, as small amounts of impurities which may exist in the fat, by becoming oxidized, contribute to the rancid odor. Professor Smith suggests the use of sodium silicate for removing free acids from fats.

&lt;&gt;

#### THE DOCTOR'S ORDERS.

She was the sort of woman who always tells everybody her business. With a cheery smile she settled herself at the counter of the hosier's shop and began:

"My husband has just been very ill—very ill indeed. So I have to do his shopping, and I want a shirt."

"Certainly, Madam," said the assistant courteously. "Stiff front and cuffs?"

"Oh, no!" she exclaimed in horrified tones. "The doctor says he must avoid anything with starch in it!"

## Necrology

### DR. JOHN B. BOND.

Dr. John B. Bond, nestor in pharmacy of Arkansas, died July 16, 1915, at the home of his daughter, Mrs. H. S. Hollis, in Warren, Arizona. His body was brought back to Little Rock, Ark., for burial. Mrs. Bond, who shared with him the joys and sorrows of a well-spent life, survives the deceased.

A sketch of Dr. Bond appeared in the January number of this Journal. He was

born November 15, 1826, at Gattysburg, Pa. Soon thereafter his parents came to Missouri, where the son was educated and grew to manhood. During the war between the states, Dr. Bond was chief surgeon of Little's Division, Price's Corps, and later medical purveyor on the staff of General Holmes and assigned to duty in Arkansas. He practiced medicine until 1872, when he established the drug business now conducted by his son.

Dr. Bond was one of the organizers of the Arkansas Association of Pharmacists in 1881, and elected the second President, serving for

three consecutive years. He was a member of the Arkansas Board of Pharmacy from the time of its organization and for fifteen years served as presiding officer. In 1883 Dr. Bond joined the American Pharmaceutical Association and at once became active in the National Association of Boards of Pharmacy, when it was organized, serving as chairman of the Executive Committee for one term. While devoted to pharmacy in his own state, he was ever helpful in the National organizations, and when the American Pharmaceutical Association decided to meet in Hot Springs, he expressed deep appreciation for the honor to the state he dearly loved.

The following is abstracted from an editorial of the Arkansas Democrat, and speaks of the esteem in which the deceased was held at home:

"Death only emphasizes the work, the life, the achievements and the influences of some men; there are great characters whose influences rise above the forgetfulness of their fellows and disproves the sage fallacy that the good men do is oft interred with their bones. Such a man Little Rock has just been called upon to mourn in the passing of Dr. John B. Bond, one of the truly great men of the community. For fifty years he was a stalwart figure in public affairs, one whose wise counsel in public or private relations was sought and heeded.

"Dr. Bond was not great as some account greatness—he never aspired to political office, neither did he participate in that consuming contest for wealth which has been the incentive of many a life. He was actively interested in all movements for civic betterment, and with his pen, his voice and his money he assisted in the advancement of many projects that aided municipal progress.

"He was interested in schools, in the promotion of industry and commerce, in the moral cleanliness of the city he loved, and in everything that would make his fellow citizens happier and more contented. He was not selfish in this, but altruistic with a self-sacrificing devotion that was an incentive to others less enthusiastic. He was a leader in his profession, an authority to whom the druggists of the state deferred as one in whose opinion they had implicit confidence. Dr. Bond was emphatically ethical, jealous of the honor of his calling, first to condemn that which was wrong or harmful, as well as first to command the good and helpful.

"These were the qualities that made him

loved by his intimates, esteemed by his business and professional associates, and respected by all. He was not a dissembler; he probably would not have succeeded in finer arts of diplomacy, which is too often the synonym for deception. But he was outspoken and direct, although avoiding unseemly contention or needless controversy. Himself the soul of honesty, it was a source of deepest pain that others should be dishonest.

"His passing, with the seventy-eight years that until recently had set lightly upon his erect shoulders, is a distinct loss to the community and his profession. He was one of God's answers to the poet's prayer, 'That He might give us men.'"

E. G. E.

## The Bulletin Board

### PROGRAMS OF SECTIONS.

The programs of the Sections herewith are not complete and will be added to prior to the sessions.

### PAPERS FOR SCIENTIFIC SECTION.

Tinctures, W. L. Scoville.

The Increase in Acidity of Hydrogen Peroxide on Standing, C. M. Ramsay and A. M. Clover.

The Retarding Effect of Certain Substances on Pepsin Digestion, C. M. Ramsay.

Infective Agents, F. E. Stewart.

Leucocytic Extract, Mr. Meinhard.

Hydrolysis of Some of the Common Vegetable Oils, W. F. Rudd.

Contraction Produced by Solutions of Salts, A. Bolenbaugh.

Standards and Tests for Absorbent Cotton and Absorbent Gauze, F. B. Kilmer.

Biological Test for the Presence of Arsenic, Tellurium and Selenium, A. Schneider.

History of the Discovery of the Alkaloidal Affinities of Hydrrous Aluminum Silicate, J. U. Lloyd.

Estimation of Morphine in Pills and Tablets, H. W. Jones.

Sempervirine, L. E. Sayre.

The Cooperation of Science and Industry, A. R. L. Dohme.

Stability of Preparations Containing Yellow Phosphorus, H. Englehardt and C. E. Winters.

Estimation of Atoxyl, H. Englehardt and C. E. Winters.

The Assay of Balsam of Peru, F. D. Dodge.

### COMMERCIAL SECTION.

Tuesday, August 10, 2 P. M.

Joint Session with Section on Education and Legislation.

Address of Chairman of Commercial Section, Edward H. Thiesing.

Address of Chairman of Section on Education and Legislation, Frank H. Freericks.

The Business Needs of Pharmacy and Legislation. For the Commercial Section, W. H. Cousins. For Section on Education and Legislation, Dr. James Hartley Beal.

Commercial Training in Colleges of Pharmacy—How the College May Better Equip the Student for Business. For the Commercial Section, Dr. Henry P. Hynson. For the Section on Education and Legislation, Dr. Wm. G. Anderson.

Present Methods of Prescription Pricing. For the Commercial Section, Dr. A. O. Zwick. For the Section on Education and Legislation, P. Henry Utech.

Nomination of Officers.

Adjournment.

### SECOND SESSION.

Wednesday, 9:30 A. M.

Individuality in Advertising, with illustrations, Dr. Wm. C. Alpers.

Arranging and Indexing Stock to Promote Sales and Improve Service, Maurice P. Schwartz.

An Eight Barreled Moth Ball Sale, Wm. J. Lowry, Jr.

The Circulating Library as a Side Line for Druggists, Franklin M. Apple.

Advertising the Prescription Department, Addison Dimmitt.

Own Make Non-Secrets Compared with Other Makes, Fred W. Connolly.

Possibility of a National Line of Non-Secrets to be Prepared by the Individual Druggist but with Common Ownership of Copyrighted Labels. Subject treated by a paper from Prof. Theo. D. Wetterstroem, Benj. E. Pritchard and D. N. Robin.

Adjournment.

## THIRD SESSION.

Thursday, 9:30 to 11 A. M.

Perfumes—Basic Material—Production—Preservation—Selling Points, Wm. A. Hall.  
Economy in Store Management, A. S. Parker.  
Developing the Sale of Cigars. Subject treated by a paper from Ernest Berger and Sol. A. Eckstein.  
Election of Officers.  
Installation of Officers.  
Final Adjournment.

## HISTORICAL SECTION.

Thursday, August 12, 2 P. M.

The Chairman's Address, Frederick T. Gordon.  
The Historian's Report—E. G. Eberle.  
The Secretary's Report—A. H. Clark.  
Pharmaceutical Happenings from 1810 to 1814, Being Additions to Contributions Presented 1913-1914, Otto Raubenheimer.  
Pharmaceutical Events a Century Ago, Otto Raubenheimer.  
Historical Notes of Kansas Pharmaceutical Association, J. S. Chism.  
Some Contributions Pharmacy Has Made to Civilization, Miss Zada Cooper.  
Brief History of the Work of the Indiana Board of Pharmacy, Wm. H. Rudder.  
A memoir of John Criddle Wharton, J. O. Barge.  
History of Pharmacy in Montana, Chas. E. Moller.  
Animal Drugs Used in Medicine During the Middle Ages in England and France, George Gehring Marshall.  
Autobiographies of American Pharmacists, Willing Rodemann.  
The Drugs Drug Store of San Antonio, Texas, accompanied by photographs, Hermon Deers.  
The Founder of the California College of Pharmacy, Richard F. White.  
Early Pharmacy on the Pacific Coast, J. E. Howell.  
Illustrated Lecture: Voyage to the East—Indies and Drug and Spice Trade of 16th and 17th Centuries, Arthur W. Linton.  
Nominations and Election of Officers.

## Societies

### AMERICAN CHEMICAL SOCIETY TO MEET IN SEATTLE.

The American Chemical Society will hold the fifty-first annual convention in Seattle August 31st; the final social session is scheduled in San Francisco.

As there is a Division of Pharmaceutical Chemistry, some members of the American Pharmaceutical Association will doubtless take advantage of this opportunity to attend this meeting.

The American Chemical Society is listed among the organizations that will have representation on the U. S. Naval Advisory Board of Inventions, of which Thomas A. Edison is to be chairman.

Frank R. Eldred, of Indianapolis, is chairman of the Division of Pharmaceutical Chemistry of the American Chemical Society.

### NEW YORK ASSOCIATION.

The thirty-seventh annual convention of New York State Pharmaceutical Association was held at Buffalo June 29, continuing for four days.

One of the interesting features of the meeting was the address by Ex-Senator Hill, of Buffalo, on the conflict which may result between the states and federal government in narcotic legislation. He viewed the Harrison law as an encroachment upon the rights of states, more particularly on account of the power given the commissioner of internal revenue to make rulings that add to or take from the law.

Resolutions were passed condemning the practice of offering premiums, trading stamps, etc., as unfair competition. A large number of interesting papers were read.

President A. S. Wadde, of Hudson, was re-elected; the other officers are as follows: First vice-president, E. L. Chilson, of Rochester; second vice-president, R. A. Austin, of Cairo; third vice-president, J. L. Stoddard, of Buffalo; secretary, F. S. Dawson, of Syracuse; treasurer, Frank Richardson, of Cambridge.

Executive committee: Dr. Joseph Weinstein, of New York City; Charles N. Lehman, of Hertenville; L. L. G. S. Slade, of Oneonta.

Dr. William C. Anderson, Dr. Joseph Weinstein and Dr. A. B. Huested were selected as delegates to the American Pharmaceutical Association meeting.

Richfield Springs was chosen for next place of meeting, during the third week of June.

&lt;&gt;

## INDIANA ASSOCIATION.

President Ernest Stahlmuth in his address at the Indiana State Pharmaceutical Association meeting, held at LaPorte, scored the dispensing physician. He deplored the lack of interest by druggists in strengthening the Association.

Among the papers read were the following: Legislation in Indiana, J. M. Barrett; Then and Now, Prof. H. E. Barnard, food and drug commissioner, Indianapolis; Synopsis of A. Ph. A. Model Pharmacy Law, A. F. Sala, Winchester; A Practical Prescriptionist, J. W. Donaldson, Indianapolis; Pharmacy for pharmacists, J. A. Aubry, Hammond; Colloid Solutions, Prof. Edward T. Niles, Indianapolis; Salesmanship and Store Management, A. J. Frazier, Muncie; Arrangement of the Modern Drug Store, M. P. Schwartz; Influence of the A. Ph. A., Prof. C. B. Jordan, Lafayette. Papers were also read by Prof. George D. Timmons, of Valparaiso, and Prof. C. C. Sherrard, of Angola. Dr. F. T. Wilcox, of LaPorte, spoke on Mutual Interests, and J. J. Keene, United States inspector, gave a talk on the United States Narcotic Law.

The new officers are: President, Charles Genolin, Nashville; vice-presidents, W. S. Margowski, Delphi; A. J. Frazier, Muncie; Ira White, South Bend; secretary, William F. Werner, Indianapolis; treasurer, Frank H. Carter, Indianapolis. Executive committee: J. A. Aubrey, Hammond; J. Lovett, Huntington; Wood Wiles, Bloomington.

The next meeting will be held at Indianapolis.

&lt;&gt;

## MICHIGAN ASSOCIATION.

Grant W. Stevens, in his presidential address to the Michigan State Pharmaceutical Association held at Grand Rapids, reviewed the work of the Association and touched upon plans for legislative work of the coming year.

Thos. H. Potts, of the N. A. R. D., in discussing the report of J. H. Webster, chair-

man of the legislative committee, spoke for uniform laws. Governor W. N. Ferry in an address advocated more reasonable hours in drug stores. Professor Schlotterbeck spoke on the practical side of the drug business.

The following officers were elected: President, C. H. Jongejan, Grand Rapids; vice-presidents, W. H. Fox, Coldwater; Roy Collins, Frankfort; treasurer, John Steketee, Grand Rapids; secretary, D. D. Alton, Fremont.

&lt;&gt;

## MISSISSIPPI ASSOCIATION.

While from the numerical standpoint of additions to the membership, other associations have passed the mark reached by the Mississippi Pharmaceutical Association, relatively the latter increased its membership by a larger percentage than any other. One hundred and seventy-five new members joined the ranks.

President J. C. McGee criticized the stamp tax, spoke in favor of the Harrison law, advocated the passage of the Association Pharmacy bill, recommended the Stevens bill for regulation of the medicine peddler. He endorsed the proposal of having the House of Delegates of the A. Ph. A. become a central organization of state associations.

The following officers were elected to serve during the ensuing year: President, H. M. Faser, Oxford; first vice-president T. C. Matthews, Leland; second vice-president, Charles Watts, Clarksdale; secretary-treasurer, Miss Flora Scarborough, Laurel, re-elected.

Meridian was selected as the next place of meeting.

&lt;&gt;

## MASSACHUSETTS ASSOCIATION.

The thirty-fourth annual meeting of Massachusetts State Pharmaceutical Association met in Springfield June 22 to 24.

President Campbell advocated conservative legislation, favored the Stevens bill, patent law reform and opposed methods of sale, which in effect were nothing more than cutting the price, such as premiums, trading stamps, etc.

The following officers were elected: President, John T. Harper, Great Barrington; vice-presidents, William Hardie, Fall River; W. C. B. Merriam, Springfield, and Walter S. Doane, Worcester; secretary, James F. Guerin, Worcester; treasurer, James F. Fin-

neran, Boston; trustees of permanent fund, William F. Sawyer, Boston; T. E. Mole, Adams; James W. Cooper, Plymouth; for appointment to the state board of pharmacy, James F. Hayes, Fitchburg; George Carroll, Gardner; Frederick Brandes, Worcester; for appointment to the state board of health, Philip V. Erard, Springfield; William M. Curtis, Boston.

#### DELAWARE ASSOCIATION OFFICERS.

The following will preside over the affairs of Delaware Pharmaceutical Association during this year: President, Albert Daugherty, Wilmington; vice-presidents, James T. Challenger, New Castle; James W. Wise, Dover; H. P. Luff, Felton; secretary, Miss Norah V. Brendle, Wilmington; treasurer, Oscar C. Draper, Wilmington. Board of directors: John M. Harvey, Wilmington; Erdman Hoffman, Wilmington; George W. Rhoades, Newark; W. H. Chambers, Lewes; James T. Challenger, New Castle.

#### GEORGIA ASSOCIATION OFFICERS.

The following officers were elected by Georgia Pharmaceutical Association: President, Samuel E. Bayne, Macon; vice-presidents, Dr. John Wages, Winder; Henry Bell, Albany, and D. A. Solomons, Jr., Savannah; secretary, T. A. Cheatham, Atlanta; treasurer, D. G. Wise, Atlanta.

Atlanta was selected as the next place of meeting.

#### NEW JERSEY ASSOCIATION.

The forty-fifth annual meeting of New Jersey Pharmaceutical Association was held June 15 to 18, at Spring Lake.

The legislative committee was instructed to introduce a bill in the next legislature, providing for a prerequisite education clause in the Pharmacy law.

A large number of instructive papers were presented and Dr. William Mansfield delivered a stereopticon lecture on The Medicinal Plants Grown in New Jersey. Dr. Mansfield and F. G. Herle were elected to honorary membership.

The association voted to go to Long Branch next year.

The newly elected officers of the association are: President, Charles J. McCloskey, Jersey City; first vice president, Garrett J. Byrnes, Maplewood; second vice-president,

Daniel H. Hills, Spring Lake; secretary, Frank C. Stutzlen, Elizabeth; treasurer, Edgar R. Sparks, Burlington.

Board of Trade—John G. Block, Jersey City; John D. Case, Somerville; Isaac G. Keuper, Trenton; Harry W. Crooks, Newark; Charles Holzhauser, Newark; Charles J. McCloskey, Jersey City, and Frank C. Stutzlen, Elizabeth.

Legislative Committee: S. D. Woolley, Ocean Grove; David Strauss, Newark; G. M. Beringer, Camden; J. C. Gallagher, Jersey City, and T. S. Armstrong, Plainfield.

The Women's Auxiliary elected the following officers: President, Mrs. Louise Munds; vice-presidents, Mrs. Anna Crooks and Mrs. L. A. Taylor; secretary, Mrs. G. H. Horning, and treasurer, Mrs. A. G. Woolley.

#### OHIO ASSOCIATION.

The Ohio State Pharmaceutical Association held its 37th annual meeting at Cedar Point, on Lake Erie, July 13 to 16.

While a large part of the constructive work of the convention was that of reorganization and remodeling the Constitution and By-Laws, the usual volume of current business was transacted with good reports of work accomplished by the more important and active committees. Results of the affiliation with the Ohio Public Health Federation during the past year were most gratifying in the legislative work accomplished. Two laws backed by the Association, a prerequisite and a pharmacy bill to return the enforcement of the pharmacy laws to the Board of Pharmacy, were enacted, and a number of undesirable bills were killed. The pharmacy bill, however, was vetoed by the Governor on a minor point.

The officers elected were: President, J. E. Gallaher, Dayton; First Vice President, F. D. Christian, Sidney; Second Vice President, W. H. Brinker, Bellevue; Secretary, Theo. D. Wetterstrom, Cincinnati; Treasurer, L. W. Funk, Columbus; Member of Council for Five Years, W. M. Bowman, Toledo.

#### FLAVORING EXTRACT MANUFACTURERS' ASSOCIATION.

The fifth annual meeting of the Flavoring Extract Manufacturers' Association of the United States of America was held in the Hotel Statler, in Cleveland, O., on July 8, 9 and 10.

Resolutions indorsing the Stevens bill offering price protection for standard articles of commerce, and the model bill prohibiting all manner of misrepresentation, verbal as well as written or printed, were adopted by the members at the business sessions. Frank L. Beggs, of Newark, O., formerly first vice-president, was elected president, succeeding Dr. S. H. Baer, of St. Louis, Mo., who was chosen president of the Association at last year's meeting. Several other changes were made in the other offices, the election resulting as follows: President, Frank L. Beggs, of Newark, Ohio; first vice-president, C. F. Sauer, of Richmond, Va.; second vice-president, J. O. Schlotterbeck, of Rochester, N. Y.; secretary, F. P. Beers, of Earlville, N. Y.; and treasurer, Gordon M. Day, of Milwaukee, Wis., succeeding Robert F. Heckin, of Cincinnati, O.

### The Pharmacist and the Law

Recent court decisions, involving fixed prices should not affect the attitude of druggists nor associations anent the Stevens bill.

The Stevens bill is intended to legalize contract for the control of resale prices, irrespective of the patent law, as a protection to good-will and reputation.

The opposers of the measure should convince retail druggists that they must come to the support of this desirable legislation, otherwise it will not be enacted. The opposition includes mail order houses, chain stores, etc.

<>

#### PHILADELPHIA DRUGGISTS PROTEST AGAINST TREASURY DECISION No. 2213.

Pointing out that Treasury Decision No. 2213, recently issued, is not only confusing and misleading, but that it discriminates between legitimate pharmacy in favor of patent and proprietary medicines, the Philadelphia Association of Retail Druggists at a largely-attended meeting at the Philadelphia College of Pharmacy, July 9, after a thorough discussion of the decision, adopted the following resolutions:

WHEREAS, In the enforcement of the Harrison law a Treasury Decision No. 2,213 has

been issued by the Department of Internal Revenue; and

WHEREAS, In this decision an interpretation of the words "preparations," "remedies" and "prescriptions" have materially changed the exemptions in Article 6 of the law, which is contrary to the thought of those responsible for the enactment of the law; and

WHEREAS, This decision prevents the renewal of prescriptions containing narcotics in any quantities, for both external and internal use, allowing at the same time the sale of patent and proprietary remedies and medicines containing narcotics in quantities exempted; and

WHEREAS, The enforcement of this ruling discriminates between any legitimate pharmacy in favor of patent and proprietary medicines; and

WHEREAS, Webster's definition of "prescription" as used medicinally is defined as a "prescribed remedy," which in Article 6 of the law is exempt; therefore, be it

*Resolved*, That the Philadelphia Association of Retail Druggists in meeting assembled at Philadelphia, Pa., on July 9, protest against this unjust Treasury decision; and be it

*Resolved*, That the said decision is contrary to the wording of Article 6 of the act; and be it further

*Resolved*, That the decision discriminates against ethical pharmacy in favor of patent and proprietary medicines containing exempted narcotics; and be it further

*Resolved*, That the enforcing of the decision will work a hardship on pharmacists and the medical profession, as well as the laity in the renewing of legitimate prescriptions, calling for narcotics in minute quantities; and be it further

*Resolved*, That the Philadelphia Association of Retail Druggists, in meeting assembled, protest against the decision, as a whole, and call upon the Hon. W. G. McAdoo, Secretary of the Treasury of the United States, and the Hon. Wm. H. Osborn, Commissioner of Internal Revenue of the United States, for a just and equitable hearing on Treasury Decision No. 2,213; and be it further

*Resolved*, That a copy of these resolutions be forwarded to the Hon. Secretary of the Treasury of the United States and to the Commissioner of Internal Revenue of the United States.

#### FOOD AND DRUG LAW ANNOUNCEMENTS.

The United States Bureau of Chemistry has collected a sample of a product labeled "Oil of Sandalwood, German." Analysis shows this article to consist of a mixture of oil of amyris balsamifera (sometimes improperly called "West Indian oil of sandal-

wood") and oil of copaiba. It does not contain any true oil of sandalwood. The name "Oil of Sandalwood, German," does not represent the facts, and the product is therefore misbranded. It should be labeled as "Oil of Amyris Balsamifera Compound," "Oil of Copaiba Compound," "Oil of Copaiba and Amyris Balsamifera," or vice versa, depending on the oil which predominates in the article. In this connection Food Inspection Decision 63, relating to the use of the word "compound" in names of drug products, should be consulted.

Food Inspection Decisions 142 and 146 do not forbid the use of saccharin in drugs generally. If an article is sold under a name recognized by the United States Pharmacopoeia or National Formulary, and such article deviates from the prescribed standard, however, the nature and character of such deviation must be clearly stated on the label, as required by Section 7 of the Federal Food and Drugs Act.

The term "aromatized castor oil" on a label is not considered sufficient to fulfill the requirements of the act in describing a castor oil containing saccharin in addition to certain aromatics. The label should also plainly show that the article varies from the pharmacopoeial standard for castor oil in that it is sweetened with saccharin.

#### SODA FOUNTAINS AS SOURCES OF INFECTION.

A. J. Lanza of the Public Health Service in an article in Public Health Reports on the interstate migration of tuberculous persons,

says that soda-fountain utensils are common centers and drinking devices in the most vicious sense of the word. He has seen advanced consumptives at soda fountains, and at soda fountains are a common rendezvous for children, the danger is apparent. Soda-fountain attendants are likely to be careless in the handling and washing of cups, spoons and glasses, and he has observed on more than one occasion advanced consumptives put down glass and spoon which were then carefully rim of in standing water and placed on the table for the next customer. He saw that in hotels, cafes, and other eating places the glass was generally cleaned in machine, or

at least soap and hot water are used, and while potentially sources of infection, the

danger would be less than by the careless rinsing that suffices at soda fountains.

#### HABIT-FORMING DRUGS—HEROIN—SALE BY CLERK.

Appeal was made from a conviction of unlawfully selling morphine, the trial court having directed the jury to return a verdict of guilty. The New Jersey act upon which the indictment was based (P. L. 1908, p. 399), reads as follows: "Any person who shall sell, give away, furnish or dispose of the alkaloid cocaine, or its salt, alpha or beta eucaine, or their salts, opium, morphine, codeine, chloral or any of the derivatives of chloral, or who shall sell, give away, furnish or dispose of any admixture of cocaine or eucaine or any patent or proprietary remedy containing cocaine or eucaine, except on the written prescription of a duly licensed and practicing physician, shall be guilty of a misdemeanor." The defendant was a druggist in Jersey City, and a graduate of a recognized college of pharmacy. The alleged commission of the offense charged consisted in the fact that a clerk in the defendant's employ sold a bottle containing 100 tablets, each tablet containing one-twelfth of a grain of "heroin," to one Courtney. The clerk when employed had been instructed by the defendant to sell no drugs contrary to law. Courtney, it seemed, had made prior purchases of the drug at the defendant's store, but the defendant testified that when these sales were made he was not informed that heroin was included in the category of habit-forming drugs, and it was held to be inferable from the testimony that the general discovery of that fact has been only of comparatively recent date.

To bring the commission of the offense within the language of the statute, the state offered expert testimony to show that heroin is in fact morphine. Expert chemists in behalf of the defendant testified that heroin and morphine are two distinct drugs, the latter being a very old alkaloid, and the former a comparatively recent derivative of morphine, and that each responds differently to recognized chemical tests. It was also in evidence that the two drugs respond differently on the human system, and that heroin may be used with benefit for throat ailments. The court did not deem it necessary to say

more in the disposition of the case than that the statute in question does not include in its categorical statement of the inhibited habit-forming drugs the drug known as heroin. If it were known and in existence by name as a habit-forming drug at the time of the enactment of the prohibiting law, it must be assumed that the Legislature purposely excluded it. If it were not known, and not in existence, at that period, it was equally manifest that the Legislature did not have it in mind in its generic designation of habit-forming drugs. But if it were conceded that the language of the act included heroin among the derivatives of the drugs specifically condemned, the difficulty of sustaining the conviction lay in the fact that the defendant personally did not sell the drug, that he had given orders to his clerk not to sell habit-forming drugs, and that when he learned that this drug was included in the class of habit-forming drugs, he ceased to sell it. This testimony presented an issue of fact as to the defendant's guilt which should have been left to the jury to determine. The judgment of conviction was therefore reversed.

State v. Norwood, New Jersey Supreme Court, 93 Atl. 683.

## Council Business

### COUNCIL LETTER No. 28.

Philadelphia, Pa., July 2, 1915.

To the Members of the Council:

Gentlemen—*Motion No. 44 (Election of Members; Applications No. 175 to No. 215, inclusive)*, has received a majority of affirmative votes.

*Motion No. 45 (Election of Members)*. You are requested to vote on the following applications for membership:

No. 216. Harry Vogel Becker, 576 Mission St., San Francisco, Cal., rec. by Fred I. Lackenbach and K. B. Bowerman.

No. 217. William J. Clancy, 657 First St., LaSalle, Ill., rec. by Wm. B. Day and C. M. Snow.

No. 218. John W. Forbing, 2435 Brown St., Omaha, Neb., rec. by H. F. Gerald, M. D., and I. Curtis Arledge.

No. 219. Harry Alexander Shapiro, 139

Manning St., Portsmouth, N. H., rec. by John G. Godding and Theodore J. Bradley.

No. 220. Oakley Smith Skinner, Windsor, Vermont, rec. by C. Herbert Packard and Theodore J. Bradley.

No. 221. Armand Merrill Dupaul, Hamilton St., Southbridge, Mass., rec. by Theodore J. Bradley and Fred W. Archer.

No. 222. James Weston Pratt, 5 Summer St., Quincy, Mass., rec. by Howard H. Smith and Theodore J. Bradley.

No. 223. Florin Joseph Amrhein, 61 Fort Ave., Roxbury, Boston, Mass., rec. by Elie H. LaPierre and Theodore J. Bradley.

No. 224. George Weldon, Paris, Idaho, rec. by H. H. Whittlesey and Wm. B. Day.

No. 225. Henry Louis Kath, West 85th St., near 32d St., Seattle, Wash., rec. by C. W. Johnson and Forest J. Goodrich.

No. 226. Harry Breslaw, 64 West 144th St., New York, N. Y., rec. by Otto Raubenheimer and Jeannot Hostmann. Best Thesis Presented in Chemistry, University State of New Jersey, "Tea as Sold in the American Market."

No. 227. Jacob Bankoff, 345 Hopkinson Ave., Brooklyn, N. Y., rec. by Otto Raubenheimer and Jeannot Hostmann. Best Thesis Presented in Balneology, University State of New Jersey, "Mineral Springs of the Fifth District of New Jersey."

No. 228. Charles Mueller, 1304 John St., Guttenberg, N. J., rec. by Otto Raubenheimer and Jeannot Hostmann. Best Thesis Presented in History of Pharmacy, University State of New Jersey, "Contribution to the Oldest History of Pharmacy."

No. 229. Abraham Rosenberg, 524 East 12th St., New York, N. Y., rec. by Otto Raubenheimer and Jeannot Hostmann. Best Thesis Presented in Physiological Chemistry, University State of New Jersey, "Variations of Carbohydrates in the Urine in Diabetes."

No. 230. Reuben Podolsky, 885 Jennings Ave., New York, N. Y., rec. by Otto Raubenheimer and Jeannot Hostmann. Best Thesis in Pharmacy, University State of New Jersey, "Improvements in Galenical Preparations of Digitalis."

No. 231. William C. Royse, 431 South Fifth St., Terre Haute, Ind., rec. by A. H. Dewey and W. F. Gidley.

No. 232. Edward Rudy Gifford, 23 Robin Hood St., Dorchester, Mass., rec. by Leon A. Thompson and Theodore J. Bradley.

No. 233. Fred Martin Neninger, 513 South Warren St., Syracuse, N. Y., rec. by Willis F. Gregory and Wm. B. Day.

No. 234. Jacob Bernstein, 45 Peckham St., Buffalo, N. Y., rec. by Willis F. Gregory and Wm. B. Day.

No. 235. Hugh Adelbert Judd, 836 Main St., Buffalo, N. Y., rec. by Willis F. Gregory and Wm. B. Day.

No. 236. Bernard Edward Tracy, 72 West

North St., Hion, N. Y., rec. by Willis F. Gregory and Wm. B. Day.

No. 237. Isaac Benjamin Bloomfield, 1638 North St. St., Philadelphia, Pa., rec. by J. W. Sturmer and F. E. Stewart.

No. 238. George V. Whitney, M. D., 2206 Freeman St., Houston, Texas, rec. by E. G. Eberle and R. H. Walker.

No. 239. Frank B. Dwyer, 1320 Washington Ave., Houston, Texas, rec. by R. H. Walker and E. G. Eberle.

No. 240. Elbert S. Dunn, Neches, Texas, rec. by E. G. Eberle and R. H. Walker.

No. 241. James G. Mauzy, 511 Main St., Plattsmouth, Neb., rec. by Frederick G. Fricke and A. V. Pease.

No. 242. Claude Aikman, Jenks, Oklahoma, rec. by Charles H. Stocking and Edwin DeBarr.

No. 243. William Eischeid, Norman, Okla., rec. by Charles H. Stocking and Edwin DeBarr.

No. 244. E. E. Weiss, Higgins, Texas, rec. by Charles H. Stocking and Edwin DeBarr.

No. 245. Oscar G. Salb, care John T. Milliken & Co., St. Louis, Mo., rec. by J. H. Beal and J. W. England.

No. 246. Charles W. Antony, 207 Tuscarawas St., W. Canton, Ohio, rec. by Frank Cain and J. H. Beal.

No. 247. Raymond Keith O'Brien, 222 N. Craig St., Pittsburgh, Pa., rec. by J. A. Koch and A. E. Judd. Prize membership—*Materia Medica*—by Dr. A. E. Judd, Pittsburgh College of Pharmacy.

No. 248. Elmer Bernard Deiss, 1336 Fifth Ave., Pittsburgh, Pa., rec. by J. A. Koch and Carl Saalbach. Prize membership—*Pharmacy*—by Dr. Louis Saalbach, Pittsburgh College of Pharmacy.

No. 249. Charles Horner Troxell, 430 West Fourth St., Weston, W. Va., rec. by J. A. Koch and Carl Saalbach. Prize membership—*Pharmaceutical Products*—by Dr. Louis Saalbach, Pittsburgh College of Pharmacy.

No. 250. Henry J. Strauch, 848 East Ohio St., Pittsburgh, Pa., rec. by J. A. Koch and Carl Saalbach. Prize membership—*Pharmacognosy*—by Dr. L. K. Darbaker, Pittsburgh College of Pharmacy.

No. 251. Harry A. Stype, 658 Lincoln Ave., East Liverpool, Ohio, rec. by J. A. Koch and Carl Saalbach. Prize membership—*Organic Chemistry*—by Dr. J. A. Koch, Pittsburgh College of Pharmacy.

No. 252. Herman Henry Blomster, 439 Ninth Ave., New York, N. Y., rec. by Louis Berger and J. Leon Escott.

No. 253. William Franklin Baum, 348 Vermilion St., Danville, Ill., rec. by Wm. B. Day and C. M. Snow.

No. 254. Auguste Bois, 528 Cambridge St., Allston, Mass., rec. by Albert J. Brumelle and William S. Flint.

No. 255. Joseph Kahn, Phar. D., 110 Bay Seventeenth St., Brooklyn, N. Y., rec. by Caswell A. Mayo and Jeannot Hostmann.

No. 256. Elvin R. Bergren, Essex, Iowa, rec. by Wilber J. Teeters and R. A. Kuever.

J. W. ENGLAND,  
Secretary of the Council.

415 N. Thirty-third Street.

## WAR DEPARTMENT.

List of changes of stations covering period ending June 30, 1915, in the cases of Sergeants First Class, and Sergeants:

### SERGEANTS FIRST CLASS.

John O. Perry, from Ft. H. G. Wright to Ft. Michie.

Adolph H. Lienhart, from Ft. Michie to Ft. H. G. Wright.

Yarnall L. Bowers, from Ft. Adams to Ft. St. Michael.

Harry N. Fuller, from Ft. St. Michael to Ft. Lawton for assignment.

Shelby G. Cox, from Ft. Omaha to Ft. Gibbon.

James E. Young, from Walter Reed General Hospital to Fairbanks, Alaska.

Richard A. Wood, from Ft. Gibbon to Ft. Lawton for assignment.

Albert G. Fisher, from Fairbanks, Alaska, to Ft. Lawton for assignment.

George W. Wersche, from Ambulance Company No. 3, to the Philippine Department.

Walter H. Cook, from the Hawaiian Department to furlough in the U. S.

Robert G. Kennedy, from the Philippine Department to Ft. Riley.

Thomas G. Williams, from the Philippine Department to Ambulance Co. No. 4.

Glen D. Gorton, from Ft. Riley to Ft. Leavenworth.

William D. Walters, from Ft. Wadsworth to the Philippine Department.

William George, from Ambulance Company No. 4 to the 4th Infantry Hospital.

Edward W. Pennypacker, from the 4th Infantry Hospital to Ft. Wadsworth.

Frank O. Nicodemus, from the 2d Division to Ft. Des Moines.

Robert S. Ferguson, from Ft. Des Moines to the 2d Division.

## SERGEANTS.

Horace J. Caterer, from Ft. Jay to the U. S. Mine Planter "General Samuel M. Mills."

William Alexander, from the U. S. Mine Planter "General Samuel M. Mills to Ft. Jay.

Avis C. Waller, from the Letterman General Hospital to the Philippines Department.

William Q. Fancher, from the Letterman General Hospital to the Philippines Department.

Melville B. Hamilton, from the 2d Division to Ft. Omaha.

Isaac N. Hendrixson, from the Army and Navy General Hospital to Ambulance Company No. 3.

Marshall Ellis, Jr., from Ft. Michie to Ft. Terry.

George Bruley, from Ft. Snelling to Ft. Brady.

Benjamin F. Mason, from Ft. Brady to Ft. Snelling.

John L. Morgan, from Ft. Baker to the Presidio of San Francisco.

Schiller Scroggs, from Ft. Logan to Ambulance Company No. 1.

Patrick Darby, from Ft. Robinson to the 2d Division.

Charles W. Jensen, from Ft. Hamilton to the Cable Boat "Joseph Henry."

Elmer Jeen, from the Philippine Department to the U. S. on furlough.

William Bowman, from the Philippine Department to the U. S. on furlough.

August H. Waitz, from Vancouver Barracks to Ft. Flagler.

Clarence K. Aikin, from Ft. Oglethorpe to Ft. Barrancas.

Charles L. Briscoe, from Ft. Hancock to the Philippine Department on August Transport.

Harry E. Lyons, from Ft. Hancock to the Philippine Department on August Transport.

Olaf C. Larsen, from the Cable Boat "Joseph Henry" to Ft. H. G. Wright.

Joseph Stahl, from Ambulance Company No. 7 to Ft. Bliss.

## DETERMINATION OF UREA IN BLOOD.

The urea in blood may be determined with facility and accuracy by precipitating it as the urea-xanthhydrol compound by means of Fosse's method. In order that the precipitate shall be pure, it is necessary first to eliminate any albumin present. This is done by means of the following modified Tanret's reagent: Mercuric chloride, 2.71 gms; potassium iodide, 7.2 gms.; glacial acetic acid, 66.6 mls; water to make up to 100 mls. Ten mls of serum of the blood to be tested and 10 mls of this reagent are mixed in a centrifuge tube and spun. About 17 mls of liquid will be obtained. An aliquot part of this, say 15 mls, is treated with an equal volume of glacial acetic acid, and then with a volume of 1:10 methyl alcohol solution of xanthhydrol equal to one-twentieth of the total volume, which in this case would be 1.5 mls. After one hour the precipitate is collected on the filter pump, preferably on the special form of filter devised by the author, then washed with alcohol, dried, and weighed. The amount of urea per litre of urine may be found from the following formula:

$$\frac{\text{Weight}}{7} \times \frac{20}{15} \times 100$$

—R. Fosse, A. Robyn, and F. Francois (*Comptes rend.*, 1914, 159, 367, through *Pharmaceutical Journal*.)

### Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,  
From 2342 Albion Place, St. Louis, Mo.  
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or type-written.

A business should be known for the honesty and integrity of those who are behind it,—the kind of honesty that is taken for granted; the kind that shows our acts to be automatically honest, as if from habit, and it cannot be otherwise, for as soon as we begin to notice that we are honest, or call attention to the fact, and be much impressed by our choice of methods, at that moment we are under suspicion, for honesty, from that moment, has ceased to be a habit.—Caxton.

### Wanted—Natural History Books.

The Lloyd Library, 309 West Court Street, Cincinnati, Ohio, is interested in the purchase of books relating to all branches of natural history. Book dealers issuing catalogues relating to these subjects are requested to send them to our address. Offers regarding the sale of books on these subjects will be considered at any time.

THE LLOYD LIBRARY, 309 WEST COURT ST., CINCINNATI, OHIO.

## The Sixty-Third Annual Convention

Held at San Francisco, California, August 9-14, 1915

AMERICAN PHARMACEUTICAL ASSOCIATION.

### MINUTES OF THE PROCEEDINGS OF THE FIRST GENERAL SESSION.

Before calling the general session to order, the following proceedings were had: (Professor F. T. Green of California in the chair.)

Chairman Green: Ladies and Gentlemen—It falls to the speaker's lot to do some preliminary introducing, or, rather to call to order this meeting of the American Pharmaceutical Association, the sixty-third annual meeting of this Association, an association broad in its national scope. On behalf of the Allied Drug Interests of San Francisco, or of California rather, I call it to order.

I also call your attention to the fact that in this broad name, "The Allied Drug Interests," we mean everything in the drug business, from the small boy to the wholesaler, and, therefore, on behalf of the Allied Drug Interests of California, I take pleasure in introducing to you the representative of Mayor Rolph of San Francisco, Mr. Sylvester McAtee, who will now address you.

Mr. McAtee: Mr. President, Ladies and Gentlemen:

It may sound peculiar for me to say it, but I am sorry I have to be here this afternoon therefore denying you the pleasure of hearing Mayor Rolph. Briefly, the Mayor accepted the invitation to speak to you today, without being informed of the time and place.

Most of these affairs begin in the morning and he did not have in mind the

likelihood that your meeting would be in the afternoon, and as Monday afternoon is the time for the holding of the meeting of the Board of Supervisors, beginning at 2 o'clock, at which the Mayor must preside, and as it happens to be a rather important meeting, he found it impossible to absent himself from that meeting. Therefore, I am here, a poor representative of the city, I admit, but you are in the situation, and what can you do about it? (Applause.)

However, I want to extend to you on behalf of Mayor Rolph, and therefore the city, the formal greetings of San Francisco.

We have had many meetings here this year. The best thing that has been accomplished by this Exposition, if it has done nothing else during its entire period, is the fact that it has brought together people, associations such as this, from all parts of the United States. They have come from every state, they have been of various national extractions, but they have been brought here and have been woven together more closely into the fabric of our national government.

Your organization, I understand, is the oldest pharmaceutical association in the United States. You have here men who are leaders in their particular profession.

We are glad indeed to welcome you. We realize that from such associations as this great good must come, not alone to our own community but to the entire United States, because the subjects under discussion here will disseminate knowledge which will be spread in turn to all parts of the country. Therefore, it is a peculiar pleasure that we of San Francisco have this year of welcoming such an association as yours.

There is a selfish aspect to it. We can simply rejoice that San Francisco has so many visitors. We are glad that our exposition is a success, but that is altogether the selfish aspect.

But there is something more than that. And Mayor Rolph and San Francisco feel that there is more than that due from San Francisco to its guests. We want you to feel that we are your hosts this year. We want to be worthy hosts of so many distinguished visitors. Therefore, we want to make our welcome to you the most hospitable reception in our power. We think we have somewhat of a reputation for hospitality. Incidentally, we want to ask the strangers to beware of their San Franciscan brothers, because the Californian is a peculiar type. He thinks when the Lord created California there he stopped, at the finish of his work, and the greatest of his work, but you will notice that they have the habit of swelling out their chests and saying, "We are Californians" and particularly saying, "We are San Franciscans." They seem to think it is a personal achievement of their own and they are entitled to some credit because of that fact. (Laughter.)

I will warn you that we will have it that way so you will have to look out for us; but we hope our reputation for hospitality is not altogether undeserved, and we hope you will find the warmth of our hospitality reflected upon you.

We hope your sessions here will be entirely successful; that you will have a good impression of San Francisco and California; that you will be pleased with our Exposition and will return home satisfied with yourselves, and with the world, and particularly California.

Therefore, I wish to say again, that I bring to you the regards of Mayor Rolph, and San Francisco and California, and extend to you the regrets of Mayor Rolph that he could not be here this afternoon to give to you from his own lips his greetings to your Association. (Prolonged applause.)

President Caswell A. Mayo, in responding to the welcome, said:

Mr. McAttee, Friends and Fellow Members of the American Pharmaceutical Association, Ladies and Gentlemen:

On behalf of the Association, as one of those who came from the Atlantic to the Pacific to see the wonders you have in store for us, I wish to thank you for your kind hospitality and courteous words of welcome.

Ordinarily we receive a warm welcome. We received a warm welcome at the

Nashville meeting, and we came to the conclusion that it is not always the kind of thing we should receive in the summer time.

We came here expecting to receive a warm welcome and some of us put our warm weather clothing in our trunks (which haven't arrived and we may not get them here at the Exposition) and we have been very nigh frozen ever since.

We would rather have the warmth in your welcome than in your climate.

I come to this city with a great deal of pleasure. It affords me a great deal of pleasure to speak for the Association here, because my earliest boyhood dreams were filled with the visions of the Golden Gate and things of California.

My father rode on horseback from St. Louis to Sacramento in 1849. He panned gold in the Sacramento. He was one of the vigilance committee that made San Francisco a safe place to live in.

The only heritage I have from all his privations and work is a memory—a keen appreciation of the high enterprise that has made so much of the wonderful possibilities you have in California; which has turned your deserts into smiling valleys and has made your fertile valleys sources of more wealth than could be found in any placer or tunnel or lode.

It, therefore, becomes my great pleasure to speak on behalf of the Association, and I only wish my tongue could utter the thoughts that arise in me to give adequate expression to our appreciation of the great welcome given us here in San Francisco. We thank you for your hospitality. (Prolonged applause.)

The first general session was then called to order, Monday, August 9, 1915, at 4:10 p. m., by President Caswell A. Mayo, in the convention hall of the Civic Auditorium, San Francisco, California.

President Mayo: We will proceed with the regular order of business, and I hereby declare the sixty-third annual convention of the American Pharmaceutical Association in order.

As President of this Association it becomes my duty to read to you an address. I wish I could have made this address more brief, but, unfortunately I delayed its preparation until so late a time that I found it rather lengthy.

The President then asked Vice-President Gietner to take the chair while he presented his address, which the President proceeded to read as follows:

#### PRESIDENT MAYO'S ADDRESS.

It is with peculiar pleasure that I have the honor to address the members of the American Pharmaceutical Association as President, during this meeting in San Francisco. My boyhood days were filled with dreams of the Golden Gate. My father rode with the Forty-niners on horseback from St. Louis to Sacramento. He panned gold along the Sacramento river, fought Indians on the Klamath and took part in the work of the vigilance committee which made San Francisco safe from violence. The only heritage he left me from all his privation and his toil here is a vivid appreciation of that high spirit of enterprise, of fearlessness and of tireless industry, which working through all the years has made California what it now is; has turned its deserts into fairylands of beauty

and has made its fruitful valleys sources of greater wealth than ever was gained from lode and placer and tunnel. It is this vivid imagination, this wonderful spirit of boundless enthusiasm and of untiring energy which has made possible your marvellous city, and your beautiful Exposition, and which has brought our

Association again to the Pacific Coast. We hope that we may be able to so interest our hosts in the work of our organization, in our efforts to elevate the cause of pharmacy and to improve the conditions of pharmacists that they will join with us in our efforts and bring to bear on the problems of our Association those qualities which they have seized upon and made the best possible use of the natural advantages of this wonderful country.

#### EXPEDITING BUSINESS OF THE ASSOCIATION.

At the Detroit meeting of the American Pharmaceutical Association a year ago, an effort was made to dispense with, as much as possible, the purely perfunctory portions of the program. The result was a meeting characterized by the highest efficiency. I know of no meeting of the Association at which so much work was accomplished, in so satisfactory a manner, in so short a time. The application of efficiency engineering to association work was most satisfactory. It is to be hoped that the good example set by the committee in charge of the program for that occasion will be followed and improved upon. The meetings of this Association bring together busy men whose time is of value. We cannot expect to attract these men and to retain their interest in the work if that time is frittered away in irrelevant and immaterial ceremonials. I do not wish to curtail the social entertainments provided. These entertainments furnish an essential and to many, the most inviting part of the meetings, but I do hope that it will be possible to dispense with many purely formal addresses and with those traditional but unnecessary motions which consume so much time and which accomplish so little good for the organization.

I have made a study of the programs followed by many state associations and have been surprised and pained to see how large a proportion of the time of these associations is devoted to addresses of welcome, made by people who have no interest in the members or their work and by replies made by men who have nothing to say and use a good deal of unnecessary time to say it in.

Let us set an example of efficiency in our own program which may prove helpful to all pharmaceutical organizations.

As one means to that end I recommend that the committee on by-laws be instructed to prepare and present for consideration amendments providing that the minutes of the Council shall not be read at the general sessions but that a bulletin be posted daily of acts of the Council so that any member interested in any particular action may in the general session call for full information regarding such action. All acts of the Council to remain subject to review by the general session.

The American Chemical Society provides for associate members who participate in the proceedings of the branches but not in those of the general meeting and who do not receive the publications of the Society. These members pay \$2 instead of \$10 annual dues. This associate membership has been helpful in obtaining recruits to the full membership. A similar associate membership has been proposed for our Association.

On investigation I find that the same purpose can be served without any changes in the laws of the general association by having the branches arrange for associate members of the branches. I am told that they now have that authority though many of the officers are apparently not aware of it. I therefore recommend that the General Secretary be instructed to write to the officers of the several Branches directing their attention to this suggestion and pointing out just what steps would have to be taken by any branch which might desire to adopt this suggestion.

As I approach the conclusion of my year of office I am impressed with the opportunities for service which I have missed, largely through my failure to recognize these opportunities early enough in the course of my administration. The present method of election of officers affords an opportunity for the incoming officials to lay their plans long before induction into office, and I recommend that the General Secretary, who is in effect a permanent official, be instructed when

notified of the results of the ballot to communicate with each of the newly elected officials, outlining the duties which will be required of him and suggesting to the newly elected President that he endeavor, so far as possible, to complete the list of his appointments before the meeting at which he is to be installed, so that he will be in a position to announce his committees when installed, thus giving the members of the committees appointed by him, ample time in which to prepare their work for the succeeding year's meeting.

#### PHARMACEUTICAL INDUSTRIES.

Not since our own country was plunged into fratricidal strife more than half a century ago have we confronted such an upheaval in politics, in finance and in commerce as we are now going through. As a result of the isolation incident to the civil war the Republican party became, as the occasion seemed to demand, the party of protection and sought to build up our own industries by protection with a view to meeting those conditions brought about by isolation from the remainder of the world. The Democratic party adhered to the principles of an open market, and with all the various changes in policies incidental to changing conditions, these two main principles of difference have been adhered to by the two different political parties for the past half century.

We are again confronting a need for helping ourselves, for being independent of international trade due to the interruptions to commerce caused by the European War. I should not be surprised to see the leaders of the Democratic party deliberately adopt a policy of protection, as the proper means for meeting these conditions of commerce forced upon us against our will.

#### OUR CRUDE DRUG SUPPLIES.

The sudden cessation of imports from Central Europe last August precipitated a panic in the crude drug market which became so thoroughly demoralized that no quotations could be made except for spot transactions. Those who consumed crude drugs in large lots, becoming panic stricken, bought up stocks for their own need regardless of prices. This panicky condition of the market, as you are all well aware, soon disappeared leaving a range of quotations, however, much above those which rule in normal times. The vast scale upon which the war is being carried on, the immense hordes of troops thrown into the field and the huge sums of money expended in the prosecution of the war lead us at first to hope for its early termination. These hopes had something to do with our attitude towards supplies of crude drugs. We felt that at the worst we would be deprived of one year's crop. The impression has gained ground that we shall have war for at least one, and probably several years longer. This conviction is echoed in the prices commanded by crude drugs of European origin, which have continued to rise in cost as the stocks have diminished in volume. We are now confronted with the need for prompt, energetic and concerted action to avoid any further curtailment of our already scant stocks.

A survey of the indigenous materia medica shows that if it were feasible to collect all the drugs which grow wild in the United States we should be able to supply our deficiencies in many directions. The increased attention which has been given of late years to the question of drug plant cultivation has pointed out certain directions in which, with but a little encouragement, we may hope to become independent of imported supplies. At the Detroit meeting the President was instructed to appoint a committee on crude drug supplies with the object of making a survey of the crude drug situation and possibly pointing out a way to collect at least a portion of such drugs as are indigenous in this country but which have not heretofore been collected on a commercial scale. While I elaborated a comprehensive scheme for work of such a committee and asked several members to act as its chairman, the men appointed were unable to undertake the task and

the correspondence with first one and then another possible chairman took so long that there was not sufficient time left in which to put into execution the plans which I had in view. I have therefore not appointed the committee, but recommend that the incoming President be instructed to appoint such a committee on the supplies of botanical drugs with the request that the members of this committee carry on a campaign of education throughout the United States as to the indigenous drugs which may be collected with possible profit to the collector and with advantage to the cause of medicine, soliciting the coöperation of the various state agricultural experiment stations and state agricultural colleges and of the United States Government. The Department of Agriculture has already done much preliminary work in this direction. Some of the State Agricultural Colleges have likewise taken up the subject of drug culture and drug collection. We are all familiar with the excellent pioneer work in the matter of drug culture which has been done by the School of Pharmacy of Minnesota and the School of Pharmacy of the University of Wisconsin.

The University of Michigan at Ann Arbor has recently acquired 85 acres of land which is to be devoted to experimental drug farming. The University of Nebraska at Lincoln has also just begun the development of a medicinal plant garden and the University of Washington at Seattle has lately expanded their small botanical garden so as to enable the institution to furnish information regarding such drugs as may be grown advantageously in that state.

Manufacturers of medicinal products have paid considerable attention of late years to the cultivation of medicinal plants. In England several firms have long had extensive plantations for the growth of certain drugs and have been enabled to command high prices for their products even in competition with the plentiful supply at the low prices which prevailed prior to the war in Europe. Such firms as Stafford Allen & Sons, Ransome & Son and Squire & Son have long since placed drug culture in England on a sound financial basis. But they restrict themselves to certain lines which they have found to be profitable, and for the main part we must still depend upon wild drugs.

In the United States extensive experiments have been made in the growth of a few drugs by Johnson & Johnson, Eli Lilly & Co., H. K. Mulford & Co., and Parke, Davis & Co., which are admirably summarized in a paper presented at the last meeting of the Manufacturers of Medicinal Products by a member of this Association, Dr. Fred. B. Kilmer. Quite an extensive experiment was carried on by Johnson & Johnson in Castro Valley, Alameda Co., California under an arrangement with Prof. Albert Schneider, a report of which appeared in the proceedings of this Association for 1909. While this experiment was financially unsuccessful much valuable experience was gained for guidance of workers in this field.

Quite extensive experiments are being carried on at Glenolden, Penna., by H. K. Mulford & Co., who have about two hundred acres there devoted to experimental drug farms. Last year their crop of cannabis yielded a very high proportion of active drug. The plant seeded itself where it had been stacked and in June I saw a number of volunteer plants growing there that were four feet tall and most promising in appearance. The experience of H. K. Mulford & Co., with this particular plant coincides I believe with that of the Department of Agriculture. In point of physiological activity the American grown cannabis compares quite favorably with that grown in India and there would seem to be no occasion to recognize two separate drugs in the forthcoming Pharmacopœia.

Drug culture, however, needs to be supplemented with a vigorous campaign of education as to the collection of drugs now growing wild in our fields and forests. Unfortunately the monetary returns for the individual collector are not so promising as to lead any large number of collectors to devote their exclusive attention to this work. If we could have some assurance of a continuation of the relatively

high prices now commanded by indigenous drugs, the supplies of which have hitherto been drawn from Central Europe, we might induce many to help in the solution of this problem. But we have no assurance that an unexpected termination of the war may not throw on our market an abundance of these drugs at such low prices as would spell ruin to the American collector.

We have, it is true, several firms which have been busy in this field for years. Two of these located on the Atlantic slope of the Allegheny Mountains collect a very wide range of indigenous drugs and the supplies which they have furnished have been an important factor in filling the needs of our manufacturers. The world's supply of cascara sagrada is drawn from the Pacific slope. There are a number of drugs grown in other sections and hitherto uncollected in any considerable quantity, the collection of which would be most helpful to the drug market and which ought to yield a fair profit to those who undertake it.

A note of warning has been sounded by Dr. W. W. Stockberger, physiologist in charge of drugs and poisonous plant investigation of the United States Department of Agriculture against the anticipation of excessive returns from the growth or collection of medicinal plants. He rightly accentuates the need of a broad scientific knowledge of materia medica as the basis for a successful venture in the growth and collection of drugs.

It is not alone in drugs of botanical origin that we have suffered a shortage. Our most marked shortage indeed has been in those numerous and expensive chemicals derived from the coal fields. When the price of toluol was only 17 cents a gallon the coke furnaces of Western Pennsylvania found it more economical to burn the gases produced in coke making than to collect them and make further use of them, but when the supply of these products from Central Europe was shut off and the price of toluol rose to \$6.00 per gallon instead of 17 cents, and even at this high price, it was obtainable only in small quantities and with difficulty, the manufacturers of coke began the reconstruction of their furnaces so as to save and utilize the volatile constituents heretofore wasted. But this reconstruction on a large scale is time-consuming as well as expensive, and while we hear of numerous large plants now in course of construction in which all the volatile constituents of the coke industry will be made use of, yielding an abundant supply of the basic materials from which carbolic acid, salicylic acid, and aniline colors and the synthetic chemicals generally are made, the actual production of this basic material on an adequate scale is still some months off and in the meanwhile there will be an increasing scarcity and a continuation of high prices for this entire class of chemicals.

The marvelous effectiveness of the technical industries in Germany, the independence which this has given Germany of the remainder of the world in time of war and the profit this has yielded in times of peace furnish a lesson by which our own industries may well profit. Just after the passage of the tariff bill and only a few months before the outbreak of the European war one of our American manufacturers threw into the scrap heap a plant for the manufacture of chloral hydrate which cost him \$25,000.00. Had this plant been in operation when the European supplies were shut off, its products would have yielded a handsome profit on the investment and would have saved the retail druggists of the country many thousands of dollars by keeping down the price of this important drug to reasonable limits.

In this case as in the case of many other drugs which have been affected by the war, the retail druggists, the dispensing pharmacists have been called upon to foot the bill.

By common consent a certain range of prices has been established for prescriptions which afforded a reasonable, but not an excessive profit, so long as the range of cost of the ingredients was within the usual limits. Comparative survey of the price quotations on the first of June, 1914, and the first of June, 1915, shows an

enormous increase of cost in precisely those drugs which are most largely used in prescriptions. Many of these prescriptions are repetitions. The prices of these had already been established and the patron who is called upon to pay a higher price when the prescription is renewed than when it was first put up becomes at once a disgruntled customer. No matter what explanation is offered, no matter how convincing the arguments put forth in justification of the advance, the attempt to change the price leaves a sore spot and is likely to cause the loss of the patron. Unless there is some general and concerted action by the entire retail trade in the matter of prescription prices we are in but little better position when it comes to increasing the price on new prescriptions to meet the increased cost of ingredients. It is essential that the public as well as the physician and the pharmacist become acquainted with the true condition of affairs regarding the increased cost of drugs that there may be no ill feeling over this increased cost and that it may be understood that it is the exigencies of war and not the whim of the dispenser which has caused the increase in the cost of prescriptions.

#### THE MILITARY PHARMACIST.

Regardless of one's sympathies the whole world stands impressed and even amazed at the marvelous perfection of organization and preparation displayed by the German army. In one phase of this organization we as pharmacists are particularly interested; that is the organization of the medical supply service. The American Pharmaceutical Association has since 1903 taken an active interest in the status of the pharmacists in the Government service. Our standing committee on this subject has done excellent work in directing the attention of the authorities to the injustice done to pharmacy, to medicine and to the rank and file of the army by the present organization of the medical supply service. Largely through the efforts of this committee a marked improvement has been brought about in the status of the pharmacists in the navy and in the public health service. Unfortunately our efforts in the army have not been equally successful.

A study of this situation covering many years, including close personal observation in the concentration camp of the New York National Guards at Hempsted Plains at the beginning of the war with Spain, and at Montauk Point when 25,000 regular troops comprising practically the entire mobile forces of the regular army who had fought through the Spanish war, returned from Cuba, has convinced me that however praiseworthy our efforts they have been misdirected. I am confident that had we devoted the same amount of effort to the creation of a wholly new medical supply service in the army which has been devoted to improving the status of the present hospital stewards we should have had substantial results from our efforts.

The opposition on the part of the members of the medical corps of the U. S. Army to the proposals which have been made by our committee from time to time have been, and will be, sufficient to prevent any material change in the status of the hospital steward. What we must do is to propose a plan for the reorganization of a new medical supply service which without a revolution in the relations existing between the medical office and the hospital steward will relieve the medical corps from some portion at least of their pharmaceutical and analytical and sanitary duties. The purely medical and surgical functions of the medical officer are sufficiently urgent to monopolize his attention. The administrative features of the medical service must also be left in the hands of the medical officer subject always, to a certain supervision on the part of the line officers. In considering military organization we must remember that the principal duty of a soldier is to fight. Consequently the fighting force must have precedence in all things. The commands of a line officer must be paramount in the face of the enemy. In purely sanitary matters, however, the medical officer should have more authority than

he now has. In the clash between the authority of the line officer and of the medical staff, which occurred in the Chickamauga Camp during the war with Spain, the line officer was so bent upon demonstrating his precedence that he ignored the advice of the medical staff and as a consequence hundreds of young Americans lost their lives through typhoid infection which would undoubtedly have been avoided had the medical staff been in a position to give orders instead of advice. But the history of our civil war, the history of our war with Spain and the history of the British forces now being made, demonstrates clearly that the medical supply service, to be efficient, should be in the hands of highly trained pharmaceutical specialists rather than in the hands of medical men detailed for this particular department aided by hospital stewards, the very character of whose attainments renders it unlikely that they will be competent to assume the larger tasks requiring the wider vision and higher technical training which would fall to them in case our army should be placed upon a war footing.

It is a significant fact that in all the standing armies of Europe and in the Japanese army the organization of which is modeled closely on that of Germany, the medical supply service is in the hands of highly trained pharmaceutical experts whose pay and rank is sufficient to attract to the service men of the highest scientific attainments and executive ability. It seems inconceivable that the United States and Great Britain should fail to profit by the experience and example of those nations which have had the best opportunity to study and solve the military problems and which have brought to the solution of those problems the highest technical skill and training. Notwithstanding the opposition of our own medical corps to the proposal to introduce highly trained pharmaceutical experts into the army service and intrust the medical supplies to these experts, I received the intimation some few years ago from a medical officer in close touch with the situation in Washington that there might be use found for the services of half a dozen such experts. The objection raised by the military administration to the proposal to introduce such a corps of experts with commensurate rank and pay is based upon the general objection felt by the military service to the creation of separate corps of commissioned officers whose promotion is restricted within the corps. From an administrative point of view such arrangements have been found objectionable.

Such purely technical objections can not appeal to any pharmacist who has had an opportunity to observe the confusion, the waste of effort and material and the inefficiency in meeting emergencies manifested by the medical supply service of the United States Army in our civil war and the war with Spain. Much of my criticism of this service is based on hearsay and it may be unfair, but insofar as the conditions which existed in the concentration camp of the National Guard of the State of New York at the outbreak of the war and in the camp at Montauk Point at the close of the war, I speak with a personal knowledge in saying that those conditions were not such as would have existed in a properly organized medical supply service. The criticism which I have to make of this service as at present organized is its lack of elasticity and failure to make adequate provision for the sudden enlargement of the army which must take place at the outbreak of a war. The severe criticisms which the British pharmaceutical press are now aiming at the medical supply service of the British troops are precisely those criticisms to be anticipated of our own troops in a similar emergency. For the welfare of the soldiers, for the efficiency of the service and for the honor of pharmacy I deem it essential that our medical supply service be reorganized somewhat along the lines followed by Germany, France, Italy and Japan, and recommend that the committee on the Status of the pharmacists in the government service direct their efforts toward the creation of a new corps along these lines, but without relaxing their efforts on behalf of the hospital stewards.

The above picture was taken in front of the Civic Auditorium in San Francisco of members in attendance at the Sixty-third Annual Convention of the American Pharmaceutical Association. Another picture was taken of those in attendance and to have been designated the official picture. However, this did not materialize, hence the instructions were that the above be designated the official one.

## PHARMACEUTICAL EDUCATION.

The history of pharmaceutical education parallels that of other callings which have passed by gradual development from the category of a trade into that of a profession. Just as the barber-chirurgian has by almost insensible gradations developed into the ultra scientific Fellow of the American College of Surgeons, so the druggist is gradually being evolved from the grocer-apothecary of the middle ages into an educated, broadly trained scientist, expert in the use of the microscope, accurate in analysis, and thoroughly conversant with the great basic truths on which all scientific advance is based.

It is true that the commercialization of pharmacy is bewailed from the house top, the good old times of the apothecary mourned for and the present and future of our calling given up as hopelessly sordid and irretrievably venal. Every age has had its Jeremiahs who have condemned the present and bemoaned the past, but, notwithstanding these Jeremiahs the race has developed and progressed, attaining heights of scientific knowledge, and technical skill hitherto undreamed of. So too the philosophical eye can discern tendencies in existing conditions which give promise of better things for pharmacy. Of different things, it is true, and by many utterly condemned merely because they are different, but on the whole, better things beyond question.

The pharmacist of olden times and indeed of recent times was a jack-of-all-trades. He garnered his herbs, he cured them, he ground them up, extracted their virtues by maceration or percolation and eventually dispensed his fluidextracts or tinctures on prescriptions. He laboriously pounded compound cathartic pills, he spread plasters on leather, he triturated mercurial ointment until the mercury was extinguished, and in short conducted a pharmaceutical laboratory on a small, even a minute scale. He also sold a few patent medicines and a great many herbs and household remedies. He was busy in a leisurely kind of way and he had so wide a margin of profit that though the aggregate of his receipts was modest, his net income was satisfactory for a person of his modest desires. All this has been changed. He can no longer afford to gather his own herbs, to make his own compound cathartic pills, and to triturate his own mercurial ointment. These things are done as well or better, and very much more economically by highly trained specialists provided with all kinds of ingenious labor-saving machinery. The margin of profits on his sales have been gradually diminished until he must sell very much more in order to make even so modest a livelihood as would have contented him in those good old days before the need for a victrola and an automobile arose to increase the cost of living. The advent of serum therapy bringing into the field of materia medica a wholly new line of products which the pharmacist could not possibly prepare himself, has still further removed him from the category of manufacturer.

All this has made it necessary for the pharmacist to be very much more of a business man and a merchant than ever if he is to survive in the keen competition with which he is surrounded. We therefore see the introduction into the curriculum of the more progressive institutions of courses of instruction in business methods and in accounting. When the way is led in this by such institutions as Harvard University, there is no occasion whatever for the teaching faculties in pharmacy to shy at the introduction of this commercial instruction into what the faculties would no doubt like to make a purely scientific course of instruction. It has seemed to me that many teachers have misinterpreted the true significance of the words "scientific" and "commercial." They look upon the two as being in direct antithesis. They have not realized that there is a science of commerce. They have failed to grasp the opportunity which has presented itself of applying scientific methods to commercial pursuits. With the advent of the laboratory of psychology came an awakening to the fact that so apparently abstruse a study as this had a bearing upon the practical affairs of the commercial world. The studies

carried out in the psychological laboratories of Harvard University, of Columbia University, and of other institutions, regarding the response to different forms of advertising, the records made of these observations, and the deductions drawn from them have shown that in so material and commercial a field as that of advertising the application of scientific methods furnishes valuable information. The establishment of a post graduate school of business administration at Harvard University has demonstrated that it is possible to carry scientific methods into business life. It is most important that the teachers in pharmacy take cognizance of the awakening on the part of the greater Universities to the necessity of adjusting the curriculum to the needs of the student.

Our entire educational system is a survival, with slight modifications, of the classical methods of the middle ages, when the whole of culture was embraced in literature and art. The manifold demands of science and of commerce have been met grudgingly and some concessions have been made from the medieval methods, but without that complete revolution which is needed to adjust our education to the needs of the student. The wonderful effectiveness shown by the German people in the present struggle is an evidence that the careful preparation of the individual along highly specialized lines is productive of the best results in the effectiveness of the nation as a whole. In America we have followed the German methods to a certain extent but our methods of instruction have been modified materially by the cultural methods of the English Universities, where the traditions of medieval culture are still strong. The reform in our system of education must begin in the grammar school. The curriculum of the grammar school is now adjusted with a view to preparing the pupil to enter high school. But statistics show that only eight to ten percent of grammar school pupils ever attend the high school at all. The result is that ninety of the pupils are made to adjust themselves to a course of study suitable to only ten of their number. We must, it seems to me, begin the differentiation between the probable high school pupil and the pupil who will go no further than the grammar school. We should have elective courses in the grammar school which would fit the pupil for trades. Our high school curriculum is predicated largely on the supposition that all the high school pupils are to go through a college of arts. But only some fifteen percent of the high school graduates do pursue the arts course in higher schools of learning. How absurd therefore it seems to condemn all high school graduates to take a course of instruction which is only suitable for fifteen percent of them.

I am aware of the fact that educators deprecate the efforts to make their courses of instruction practical, but the increasingly severe demands of commercial competition make it necessary that the young man entering into any career be especially fitted for that career if he is to survive in it. The marvelous spread in scientific knowledge over wider and still wider areas makes specialization increasingly necessary. When the scientific knowledge of the world could be condensed into one volume it was possible for a really great mind to compass the whole field of knowledge. But with the increasing breadth of the horizon which comes with our rise in the scale of scientific knowledge, specialization becomes essential. It requires the genius of an Edison or a Thomson to cover the field of electricity alone and we must therefore be content to teach all our pupils, only the basic generalities of science and begin specialization at an early stage. The pharmacist of fifty years ago might hope to gain a fairly adequate conception of chemistry, of botany, of materia medica and of pharmacy as they were then known, in a two years' course at college supplemented by adequate training. Now that the fields of each of these departments have been so widened, the two years' course can only give a rudimentary knowledge, leaving to subsequent instruction the highly specialized aspect of all these branches of which the pharmacist must have some knowledge.

## ENDOWMENTS.

When the two year course sufficed, the unpretentious colleges of pharmacy founded by and conducted by pharmacists were able, even with the slender means at their disposal, to give fairly adequate instruction. The increasing complexity of pharmacy and the consequent demand for more instructors and more equipment are beginning to make it impossible for the school of pharmacy to furnish the necessary equipment and instruction without some addition to their income from the fees of students. This fact has been recognized in the schools attached to the State institutions whose expenditures are much in excess of their receipts from fees. Only one or two of the larger institutions conducted independently, have been so fortunate as to receive bequests which give them assurance of an independent income to supplement that derived from fees. There has been a lamentable lack of public spirit shown by men who have made fortunes in pharmacy, or at least in the drug business, in so far as pharmaceutical endowments are concerned. The only large bequest ever made to the cause of education in pharmacy came to the Massachusetts College of Pharmacy from the estate of Mr. Weeks, through the influence of our former Treasurer, Mr. S. A. D. Sheppard. Frederick Stearns has maintained a fellowship at the School of Pharmacy at the University of Michigan. The late Albert Plaut, an honored member of this Association only a few months before his death, established a fellowship at the College of Pharmacy in the City of New York, in memory of his talented father, Isaac Plaut, who was one of the best informed men regarding the characteristics and qualities of botanical drugs of his time, and whose visits to the store in which I was a clerk were more welcome and more profitable than hours of study in pharmacognosy at the college. The memory of George Seabury, for a long time an active member of the American Pharmaceutical Association, has recently been perpetuated by the foundation of a Seabury scholarship in the College of Pharmacy in the City of New York by his nephew, Dr. Henry C. Lovis, who is also a member of our Association.

These so far as I can recall are the most important and the only large endowments which have been bestowed on pharmaceutical education in the United States. We have also several scholarships providing sufficient funds for the payment of the college fees and as a beneficiary of one of these at the Philadelphia College of Pharmacy I can testify to the value of such scholarships.

Great Britain has the Bell Scholarship and also has the Fairchild Scholarship, which was established in 1904 by Fairchild Bros. & Foster, who are members of the American Pharmaceutical Association, and which is open to any apprentice or assistant of either sex, preparing to qualify under the British Pharmacy Act of 1868, or the Pharmacy Act of Ireland of 1875. This scholarship is intended to encourage study during the period of apprenticeship and thus facilitate and enhance the chances of success of the diligent student on entering for the qualifying examination.

One scholarship of the value of fifty pounds, tenable for one year, is awarded as the result of an examination conducted simultaneously at London and Manchester, England; Dublin, Ireland; Edinburgh, Scotland; Cardiff, Wales, usually during the last week of June, so that the Fairchild scholar may be able to commence his studies in the coming winter session.

The Fairchild scholar may select any well-known school or College of Pharmacy, or any other well recognized educational institution where pharmaceutical subjects are taught, to meet the requirements of the syllabus of the Pharmaceutical Society of Great Britain or Ireland where he proposes to study for the qualifying examinations.

The deed of gifts provides that college fees and expenses shall be paid, and what is over will be paid to the scholar for maintenance during the school period, by the principal of the school on behalf of the founders.

The scholarship is in charge of a Committee of Trustees, all prominent in pharmaceutical affairs, one from each of the cities where examinations are held, and of a permanent secretary, Mr. A. E. Holden, the London representative of Messrs. Fairchild Bros. & Foster.

#### FAIRCHILD AMERICAN PHARMACY SCHOLARSHIP.

In discussing the financial problems which confront the student of pharmacy recently with Mr. Samuel W. Fairchild, of Fairchild Bros. & Foster, who was for some years president of the New York College of Pharmacy, Mr. Fairchild expressed his appreciation of the need for encouraging the student in pharmacy. His experience of the operation of the Fairchild scholarship in Great Britain has convinced him that aid extended to the student at the beginning of his student career was an important and frequently a determining factor in the student's life. So much impressed has Mr. Fairchild been with the need of encouraging the pharmaceutical student that he has given me permission to announce the establishment of a Fairchild scholarship in the United States to consist of the sum of \$300 which he will provide annually for some deserving student, to be selected by a Commission composed of the President of the American Pharmaceutical Association, the President of the National Association of Boards of Pharmacy, the President of the American Conference of Pharmaceutical Faculties and the editor of the Journal of the American Pharmaceutical Association. Mr. Fairchild imposes no restrictions on his munificent gift and authorizes me to say that the details for the award of the scholarship will be left to the discretion of the Commission. It is naturally understood, however, when this Commission elaborates its plans Mr. Fairchild would like to have an opportunity of reviewing them.

I have not been able to devote as much time and thought to the affairs of the American Pharmaceutical Association during my term of office, as I should have liked to do. I have done, however, the best that I could do within the limits of my ability and of the time at my disposal, but however derelict I may have been in the routine duties of the presidency, this generosity on the part of Mr. Fairchild enables me to point with pride and satisfaction to at least one phase of my administration, for I am sure that this generous provision placed as it is in the hands of the national body of pharmacists, will not only prove of great value in encouraging the fortunate recipients to pursue their studies, but will serve as an example for others, who like Mr. Fairchild, have attained financial success in the field of pharmacy, to give substantial and public acknowledgment of their sense of obligation to pharmaceutical education, by making substantial gifts to the cause. On behalf of the American Pharmaceutical Association, on behalf of the cause of pharmaceutical education, and on behalf of those ambitious young men whose paths towards higher educational equipment will in the future be smoothed by Mr. Fairchild's bequest, we should thank the donor for his liberality and I recommend that a committee be appointed to draw up and present to Mr. Fairchild a suitable and formal note of thanks.

#### PRESIDENT MAYO'S RECOMMENDATIONS.

The address contains six recommendations:

1. That all unnecessary ceremonial addresses and replies be eliminated from our proceedings.

2. That the committee on by-laws be instructed to present for consideration amendments to the by-laws providing the minutes of the Council shall not be read in the general session, but that the acts of the Council be outlined, and that on demand of any two members full information regarding such action shall be presented to the general session and that acts of Council shall be subject to review by the general session.

3. That the incoming President be instructed to appoint a committee of fifteen on the cultivation and collection of botanical drugs with a special view to encouraging the cultivation of indigenous drugs now going to waste.

4. That the Committee on the Status of Pharmacists in United States Government service be instructed to draft and seek the passage by Congress of a bill providing for the creation of a corps of highly educated expert pharmacists, whose duty it shall be to direct the medical supply service of the United States Army, and to continue their efforts toward the betterment of the status of the men now in the service.

5. That a committee be appointed by the President to draft and present to Mr. Samuel W. Fairchild, suitable resolutions of thanks for his generosity in having established an American Scholarship of Pharmacy.

6. That the General Secretary be instructed to lay the plan of associate members of the branches before the officers of the branches instructing them as to what steps should be taken by any branch desiring to provide for associate members.

Vice-President Gietner then said:

Ladies and Gentlemen: Mr. Mayo is so well known that it is almost useless for me to say that he has again given us something abounding with the eloquence so peculiar to him; the present address, the one just delivered is no exception. It is now before you. What disposition do you desire to make of it?

Dr. H. M. Whelpley then moved that the Vice-President appoint a committee of five to consider the President's address, adding that if he might be permitted he would suggest that he be not named on the committee; motion seconded and carried.

The Vice-President then gave out the following as the personnel of the committee of five to consider the President's address:

Messrs. Osseward, Thiesing, Cousins, Godding and Nitardy.

At this juncture President Mayo resumed the chair and stated that the next business before the session would be the reception of delegates, asking Secretary Day whether he had any such credentials.

Secretary Day then announced that he had the credentials from the delegates of six national organizations, reminding the chair that it had been customary to have those delegates present the greetings of their respective national organizations, stating that the first among these came the American Medical Association; that Dr. Ray L. Wilbur was present as the representative of that great body and that he would present the greetings of the American Medical Association.

The statement of the Secretary was greeted with applause.

Dr. Ray L. Wilbur then came forward and addressed the Association as follows:

Mr. President and Members of this Association: I had assumed that Dr. Jones would represent the Association. I had no idea of appearing before you. I came largely to see something of your Association and have been very much impressed by the President's address, and also by the program which I have looked over; and before saying anything from the standpoint of the American Medical Association, as a San Franciscan I should also like to add to what the Mayor's representative has said: The hope that you will have a good time in San Francisco, and that you will call freely on any of us here for anything that we can do.

The American Medical Association has taken a tremendous amount of interest in the same sort of thing that this Association has been organized for. I think that if you watched all its activities during the last few years you are bound to see that

the best things your Association has stood for, the American Medical Association has been and is working for.

There has been a very careless period, especially from the standpoint of the physician, regarding pharmaceutical preparations and all things of that connection, but I think I can safely say that the medical profession is fairly aroused, and I think much of the credit belongs to your Association.

So, in the name of the American Medical Association, I should like to thank the faithful officers of your own Association for its services to the public and the medical profession along those lines.

Secretary Day then announced Messrs. William C. Anderson, Louis Emanuel and Frank T. Green as delegates of the National Association of Retail Druggists, inviting Dr. Green to speak for the delegation.

Dr. Green addressed the convention as follows:

Ladies and Gentlemen: Once again a few words from me as chairman of the delegation to greet the American Pharmaceutical Association on behalf of the National Association of Retail Druggists.

It was six years ago when the great fire swept this peninsula leaving ruin in its path.

Our city in its sorrow was aided by many generous donors.

The National Association of Retail Druggists gave forty thousand and six hundred dollars to aid druggists and their clerks.

Those clerks who were unfortunate were helped in their efforts to establish their homes.

Those druggists who lost their stocks were materially aided in establishing themselves in the drug business.

"Lest we forget, Lest we forget." The generous aid of the National Retail Druggists Association extended to the California druggists. (applause) you will remember they gathered a fund of over forty thousand dollars, as I stated, and sent it to our stricken city. They appointed a committee to dispense those funds. One of the first things done was to fill the needs of those who needed it; money was given immediately and freely, and done after one or two days' organization, and all over the coast, particularly around the bay cities.

Not alone was money given to these people but money also was advanced to them in the shape of notes approximating thousands upon thousands of dollars so they could start again along the lines of helpfulness to a grateful public and the people of California.

I can assure you that as a delegate of the National Association of Retail Druggists it gives me great pleasure to add my word and to take part in this meeting of the American Pharmaceutical Association. (Applause.)

The Secretary then explained that five delegates had been named as representatives of the National Wholesale Druggists' Association, asking whether any of the gentlemen were present in the assemblage, that the Secretary had not as yet met any of them and was therefore not able to call on any of them in particular, but there was no response.

Secretary Day then suggested to President Mayo that the delegation of the National Wholesale Druggists' Association be passed for the present, with the statement that the convention would receive these greetings at a later session.

The Secretary then announced that Dr. A. R. L. Dohme had been designated as the representative of the National Association Manufacturers of Medicinal Products.

The Secretary announced the delegation of the National Association of Drug Clerks as follows: P. A. Mandabach and P. F. Coffey.

Secretary Day stated that he had seen neither of the gentlemen at the session, and the presumption was that they were not present.

The Women's Organization of the National Association of Retail Druggists was then announced, and Secretary Day stated that he had a letter and also credentials from that organization; that the credentials were those of Mrs. J. L. Lemberger, Mrs. Louis Emanuel and Mrs. William C. Anderson.

The Secretary then proceeded to read a communication signed by Mrs. Nellie Florence Lee and Mrs. Fannie E. MacBride, respectively Secretary and President of the Women's Organization, National Association of Retail Druggists:

William B. Day, Secretary, American Pharmaceutical Association:

Dear Sir: The Women's Organization of the National Association Retail Druggists extends most cordial and sincere greetings to all members assembled in convention.

"May every hope be realized—  
And when the year is closed—  
All records made—the last deed done—  
The last words said, and memory alone remains—  
Of its joys, its griefs, its failures, its gains,  
May all present, with purpose full and clear  
Turn with new courage to meet the coming year."

After the reading of the communication, Secretary Day stated that he knew that it would be very agreeable to the Association to hear one of the ladies representing the National Association of Retail Druggists address the American Pharmaceutical Association in welcome, and he took great pleasure in introducing to the convention Mrs. Louis Emanuel, as representative of the Women's Organization of the National Association Retail Druggists, suggesting that it was hardly necessary that Mrs. Emanuel be introduced to anyone who has attended the meetings of the American Pharmaceutical Association in the past, because Mrs. Emanuel was so well known socially and Mr. Emanuel was so well known in legislative circles, but that it was with rare pleasure he introduced Mrs. Emanuel who would say a few words on behalf of the Women's Association.

At this juncture Mr. Emanuel arose and said:

"I happen to be Mrs. Emanuel's worser half," and she talked so much on the way coming to San Francisco that she has exhausted her vocabulary. She asks to be kindly excused. (Laughter.)

The President then responded to the greetings of the American Medical Association, stating to Dr. Ray L. Wilbur that it afforded the President great pleasure to welcome him on behalf of the American Pharmaceutical Association; that the objects of both organizations were practically identical; that both served the cause of medicine, and that there was no question but what the aspirations of both organizations were of the highest, and that it was a great pleasure to have Dr. Wilbur in their midst and to have him participate in the discussions of the convention.

Seventh Annual Meeting of the American Conference of Pharmaceutical Faculties in San Francisco

In response to the greetings of the National Association of Retail Druggists as enunciated by Dr. Green, President Mayo said:

Mr. Green, we know we will have you with us; you are one of us. It is hardly necessary to say a word of welcome to you, but your reference to the National Retail Druggists Association's fund donated to this grief stricken people is a very touching tribute and shows you appreciate the generosity of your fellow citizens.

It is hardly necessary to give you welcome; we shall be glad to have you take active part in all the Association's work.

The Secretary then announced that there were also representatives from various departments of the National Government; the Bureau of Chemistry was represented by Mr. Edgar O. Eaton, attached to the Bureau at San Francisco.

Secretary Day then stated that Pharmacist R. F. Troxler, from the Bureau of Public Health Service, had been delegated as a representative of that department.

Pharmacist R. F. Troxler responded with the following address:

Mr. President, Ladies and Gentlemen: I have been detailed by Surgeon General to represent the United States Public Health Service at this meeting.

My interpretation of those orders is that I am here not so much to enter into deliberations of this body as to observe and report upon the proceedings.

At this, my first detail, my first meeting of this Association, I hardly know what my duties are to be; but I want to assure the American Pharmaceutical Association of the continued co-operation of the United States Public Health Service in the scientific work in which the Association is constantly advancing.

Through our hygienic laboratory we have lent some aid to the Scientific Section of this body and I assure you the services of that laboratory will always be at your command. I thank you. (Applause.)

Professor Lloyd then addressed the chair as follows:

"Mr. President, we have with us a gentleman who has done so much for the benefit of pharmacy in the western states and has been so long active in the evolution of the higher art and work and has so helped us in our work, that I would ask you, my friends, as a favor, if we cannot hear from Dr. Dawson, just a word.

Professor Lloyd's statement was applauded.

The chair then asserted that he took great pleasure in introducing Dr. Dawson, Local Secretary of the American Pharmaceutical Association, whose good work had been vouched for by one of the highest authorities, Professor Lloyd of Cincinnati.

Dr. Dawson responded as follows: I had hoped that I would not be called upon. While I had my credentials in my hand I forgot to give them in until a few moments ago. And now Professor Lloyd has called on me, virtually caught me, and I am nonplussed for the moment.

I am not prepared to respond with an extended speech. I see among you here many old friends, and it gives me pleasure to greet them here in California; it makes me almost young again to see how time has dealt with them, not only in their appearance but reputation. I am glad to meet and welcome them here. (Applause.)

The Secretary then advised the chair that there was yet one more department of the national government to be represented; a very important department, too, because under its direction were a very considerable number of members, namely, the War Department; that the members to represent this department were Messrs. James Ferris Hamner and Samuel J. Harris.

President Mayo then asked whether either of these gentlemen were present, whereupon Sergeant Hammer responded and said:

Mr. Chairman, Ladies and Gentlemen: Unfortunately, we of the War Department are not allowed to criticize the acts of our superiors. You gentlemen are not subject to the articles of war and can criticize as much as you please their good judgment or lack of it in appointing me as representative of the medical department; feeble though I am, before this session is over, before this meeting is over—at one of the sections, I rather expect to make myself heard from.

For today all I will say is that for and in the name of the Surgeon General of the Army, the War Department extends you cordial greeting. (Applause.)

Secretary Day then suggested to the Chair that he had but one more communication in the matter of greetings; that he thought there was a probability of the members present being willing to give a few minutes to having one letter read, a letter from their old friend and fellow member, Francis B. Hays; the Secretary stated that he had written Mr. Hays expressing the hope that he would be able to attend this convention.

The Secretary then read Mr. Hays' reply in which he said that he was much pleased to hear from Secretary Day; that Mr. Hays' general health and strength were as good as he had any reason to expect; that his only serious trouble was with his eyesight which did not seem to improve materially. That it did not seem likely that he would ever again be able to fill a journalistic position, which he regretted, because not only did he enjoy the work, but it brought him into such pleasant relation with a lot of mighty good fellows. That he felt sure "the boys" would have a good time at the San Francisco meeting and that he would like to join them and "give a hand" to a fellow editor when he delivers his presidential address.

The chair then called for further communications and Secretary Day stated that there were none, but that the next order of business would be the reading of the minutes of the Council by the Secretary of the Council, but since these had already been published in the Journal, the reading might be omitted. It was regularly moved and seconded that the reading of the minutes of the Council be omitted; carried.

President Mayo then announced that the next order of business was the reports of special standing committees; that the committees would be called for by name; that this order of procedure be followed merely with a view to prompting the members and the chairmen of the several committees, to impress upon them the necessity of having their reports ready, after which they would be formally called for at a later session.

Secretary Day then suggested that a number of the reports were already in the Secretary's possession, the chairmen not being able to be present; that others were presented at the council meeting, and that several were presented at the meeting then in progress, and stated that it was his belief that considerable time would be conserved and it would be sufficient to merely make a general announcement that all the committee reports would be presented at the second general session, but were to be in the Secretary's hands on the evening of Monday, August 9. That the chairmen of the special committees, as well as standing committees present who had their reports ready might either give them to the

Secretary at the close of the meeting now in session or at the Bellevue Hotel on the evening of Monday, August 9. The Secretary stated the reports of the committees would be called for by the chairmen at the general session on Tuesday morning, August 10, at the Bellevue Hotel.

The President then stated that if there was no objection the matter would be closed and dispensed with after the closing of the present business in hand.

President Mayo also announced that the next order of business would be the calling of the roll of states, territories, provinces, and that after the roll call there would be a recess of ten minutes for the election and selection of the representatives on the nominating committee.

Secretary Day then stated that inasmuch as each state was entitled to two members on this committee and that five were to be appointed by the President, that it occurred to the Secretary he could save considerable time by calling the list of states, because it was quite likely that some of the states would not be represented here. That others would not be represented by more than one, while others would have one or two members, but that in the latter cases it was his thought that the convention could make the selection at the present time. The Secretary further stated that if the state had more than one member, either one of those members might serve, whereas if there were more than two, the members from such state would be required to caucus with a view to filling the membership.

The chair then stated that he thought it would be better to pursue the regular course; that there might be some misapprehension owing to the fact that some members of a state present might not be aware of the fact that other members were present, and that that would take some time.

Secretary Day then asked the chair whether the Secretary proceed with the calling of the roll, which President Mayo requested be done.

Before proceeding with the calling of the roll, Secretary Day asked whether the chair wished the members to respond, whereupon President Mayo stated that he thought it would be better to dispense with the calling of the roll.

A delegate arose and suggested that he was about to make a motion which called for the dispensing of the calling of the roll at that time, in lieu thereof moving that an adjournment be taken for ten minutes, after which the roll call be taken.

It having been regularly moved and seconded that this procedure be followed, the same was so ordered by the chair.

President Mayo then said: As we adjourn, the representatives from each of the states will assemble in groups and select the men who will appear on the committee.

Professor Lloyd then said: I rise to make a few remarks in regard to Professor Wenzell.

I regret that the time is passed for such a statement, but if you will indulge me for just a few moments, just before we take the recess, I shall be glad to be permitted to say that Professor Wenzell, of the California College of Pharmacy, professor of chemistry, was to have been with us today. He looked forward with great anticipation of pleasure in being here, but he has been called away, and I therefore request that a note be made upon our record to this effect.

Mr. Dawson requested me to make this statement, as he is modest and I am not; he asked me to make the few remarks about Professor Wenzell and the

great regard in which he was held, and to express the regret of the California delegates that he is not with us. I simply wanted to make the request so it will go in the minutes, and I know it will be appreciated.

President Mayo then stated that a tablet commemorative of Professor Wenzell was then in course of preparation; that its presentation was anticipated at the meeting then in session, and that it still might be made ready to present at the meeting before the final adjournment.

The chair stated that he was sure that the convention recalled with great regret the loss of two such members as Professor Wenzell and Professor Searby since the last meeting in California.

President Mayo also said that he had the pleasure of seeing in the Greek Theater a memorial chair to Professor Wenzell; and that this Wenzell memorial would be opened before the convention left the city.

The chair then put the formal motion to take a recess of ten minutes in order to select the Nominating Committee, which, on motion regularly made and seconded was declared carried.

After the ten-minute adjournment President Mayo called the convention to order, stating that the convention would again resume the regular order of business, which was the reading of the roll call with a view to getting the nominations for the committee on nominees; and suggested that as the Secretary read the name of the state the members or representatives of that state would please name the two men who were to represent that state on the committee of nominations.

Secretary Day then read the roster of states, and the representation was made up of the following:

<i>For California</i> —J. H. Dawson and H. V. Becker.	<i>For New Jersey</i> —Charles Holzhauer and H. V. Arny.
<i>For Colorado</i> —Wm. Beukma and F. W. Nirtardy.	<i>For New Mexico</i> —B. G. Dyne.
<i>For Illinois</i> —Wm. B. Day and Dr. J. H. Long.	<i>For New York</i> —A. B. Husted and G. C. Dickman.
<i>For Indiana</i> —Professor W. O. Speer.	<i>For Ohio</i> —Azor Thurston and E. H. Thiesing.
<i>For Iowa</i> —Gus. Scherling and Miss Zada Cooper.	<i>For Oregon</i> —C. M. McKellips and Adolph Zieffle.
<i>For Kansas</i> —J. S. Chism.	<i>For Pennsylvania</i> —Julius A. Koch and L. Emanuel.
<i>For Kentucky</i> —O. C. Dilly and J. W. Gayle.	<i>For Texas</i> —C. Beukma and W. H. Cousins.
<i>For Louisiana</i> —Phillip Asher.	<i>For Utah</i> —J. M. Balden and J. C. Culley.
<i>For Maryland</i> —J. Fuller Frames and H. L. Meredith.	<i>For Vermont</i> —W. E. Terrill and W. F. Root.
<i>For Massachusetts</i> —C. H. Packard and J. G. Goulding.	<i>For Virginia</i> —W. F. Rudd and T. A. Miller.
<i>For Michigan</i> —Willbur L. Scoville.	<i>For Washington</i> —C. Osseward and A. W. Linton.
<i>For Minnesota</i> —E. L. Newcomb and J. E. Wulling.	<i>For West Virginia</i> —S. M. Scott, Jr.
<i>For Missouri</i> —Charles Gletner and Otto L. Claus.	<i>For the Association at Large</i> —H. M. Whelpley, J. P. Remington, W. C. Anderson, E. T. Green and E. G. Eberle.
<i>For Nebraska</i> —N. P. Hansen and R. A. Lyman.	

The Chair then inquired whether there was any incidental business to be presented and the Secretary stated that in connection with the appointment of the

nominating committee that a number of the members had spoken to the Secretary about their credentials, and that the Secretary would like to advise for the information of the members that it was not necessary to have credentials in order to serve on the nominating committee. Some seemed to carry that impression, but it was the desire of the Secretary to announce that credentials should be presented before the House of Delegates which met on the night of August 9, so the delegates accredited in those credentials might be eligible to vote in the House of Delegates; and the Secretary said that he wondered if it would not be better for him to read merely the names of the associations and not the names of the members that had presented the credentials, so that any who had not presented the credentials could be cared for between the time at which he spoke and the time the House of Delegates was scheduled to meet.

The chair then said that with that provision it would be understood.

The Secretary then read off the list of associations which had presented credentials:

Alabama, Arizona, Colorado, District of Columbia, Illinois, Kansas, Kentucky, Maine, Massachusetts, Minnesota, Mississippi, Nebraska, New York, North Carolina, Pennsylvania, Vermont, Virginia, West Virginia, Wisconsin, Ohio, Washington, Utah, Iowa, New Jersey, Texas, New Hampshire, Tennessee, South Carolina, Maryland, California.

The Secretary then read the following list of colleges of pharmacy from which he held credentials:

Birmingham, California, University of Southern California, National College, Northwestern University, Valparaiso University, State University of Iowa, Louisville College, University of Maryland, Massachusetts College, University of Minnesota, New Jersey College, College of Jersey City, Albany College, Brooklyn College, Buffalo College, North Dakota Agricultural College, North Pacific College, Philadelphia College, Pittsburgh College, Medical College of South Carolina, Medical College of Virginia, University of Washington, University of Nebraska, St. Louis College, Ohio State University, University of Illinois, Columbia University.

Branches of the A. Ph. A.: Baltimore, Cincinnati, Columbus, New England, Northwestern, San Francisco, Chicago, District of Columbia, Nashville, Denver.

The Secretary then stated that there were also a few alumni associations, and enumerated them as follows:

The alumni associations of Massachusetts College, St. Louis College and Brooklyn College.

And the Women's Pharmaceutical Association of the Pacific Coast and New York Deutscher-Apotheker Verein.

Secretary Day also announced to the chair that in connection with the incidental business the Secretary would like to make one or two announcements.

Secretary Day said: In the first place, regarding a change in the program: After the program was printed we found it would be necessary for certain reasons to change the time of meeting for the joint session of the Section on Education and Legislation, Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy.

President Mayo stated that this could be found on page 9 of the program, under the date of Tuesday, August 12, opening right at the center of the program; the Chair further stating that that session which was announced for Thursday afternoon at 2 o'clock would be held on Wednesday morning, August 11, at 9:30, at the Bellevue Hotel, and the two separate sessions of the Section on Education and Legislation would be held on Thursday, one in the morning, the second in the afternoon.

The President then inquired whether there was any further general business, in reply to which Secretary Day stated there was none.

President Mayo then said: While the program provides that the Nominating Committee shall meet this evening, there will be time for it to meet immediately after the adjournment of this meeting.

On vote regularly moved and seconded, it was ordered that the Nominating Committee be called together immediately after the adjournment of the session then in progress; and the chair suggested that if they found they could dispose of the business they were at liberty to do so; if not, they could adjourn over to another time.

Secretary W. B. Day said he thought it a very opportune time to call attention to the fact that the convention was very anxious to elect its friends to membership as early in the convention as possible, and requested that if there were any persons present, pharmacists or men interested in pharmacy from any side who desired to join or take membership in the Association that the Association would be very much pleased to receive their applications at that time and promised that they would be acted upon promptly and so that the full privileges of membership and participation at the elections would accrue.

The Secretary also announced that the badges and bars might be had of the Secretary, the San Francisco bars and the gold badges of the Association; also, that the official pins, the Association pin or button might be procured of the Treasurer; and stated that there were two kinds of small buttons offered, one being a solid gold button which sold at a dollar, while the other was only partly gold, which sold at only 25 cents.

President Mayo then inquired as to whether anyone else had any incidental business to present, and there being no response, stated that a motion to adjourn would be in order, with the understanding that immediately after the adjournment of the session then in progress there would be taken up the call of the nominating committee.

It being regularly moved and seconded that the first general session adjourn, President Mayo declared the sixty-third annual meeting of the American Pharmaceutical Association adjourned until Tuesday, August 10, 9:30 a. m.

MINUTES OF PROCEEDINGS OF THE SECOND GENERAL SESSION  
OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The second general session was called to order Tuesday, August 10, 1915, at 9:30 a. m., by President Caswell A. Mayo, in the main convention hall of the Bellevue Hotel, San Francisco, California.

The Chair then called upon the General Secretary to read the minutes of the first general session.

The Chair then inquired as to whether there were any corrections to note in the minutes of the first general session, and there being no response declared that they would stand approved as read.

President Mayo announced the names of the Committee on Resolutions as follows: William C. Anderson, John G. Godding, Henry M. Whelpley, Joseph P. Remington, James H. Beal, Otto F. Claus, William C. Alpers, Julius A. Koch, F. J. Wulling, Franklin T. Green.

The General Secretary then announced that he had one or two communications in the way of reports, but that there was one specific communication which he thought had better be read, a communication from Professor Wilbur J. Teeters, Secretary of the American Conference of Pharmaceutical Faculties.

President Mayo suggested that the communication referred to be read, which was done, and follows:

"Secretary Day: President Wulling in his address made the following recommendations which should be reported to the meeting:

The committee on President's address reported favorably, first, that a standing committee on higher educational standards be appointed by the President of the Conference to work jointly with similar committees of the American Pharmaceutical Association, National Association of Boards of Pharmacy, the National Association of Retail Druggists and State Associations, said committees to work with the parent Association as well as jointly.

Second, also that a special committee on federation of all pharmaceutical organizations be appointed.

Now, this would involve the appointment of two committees by the President of this Association, a committee on higher educational standards, and a committee on federation of pharmaceutical organizations, these committees to work with other similar committees of the other bodies."

The Chair then announced that the communication was before the session for disposition.

Dr. Philip Asher asked whether the Association had a right to appoint such a committee, and whether the communication should not more appropriately be referred to the House of Delegates and then referred back.

The General Secretary suggested that the communication was not a resolution.

Mr. Asher then desired to know as to whether such a committee was already in existence.

The Chair stated that the appointment of such a committee would require authorization by the Association; there would be a special committee appointed without direct authorization or perhaps a standing committee, that no doubt it contemplated a standing committee, but that if a standing committee were ap-

pointed it would require the changing of the by-laws, and that therefore in the opinion of the President it had better go to the Council, and then be referred to the Standing Committee on By-Laws.

Dr. Asher then stated that if he was in order he would move that the communication be received and referred to the proper committee.

Dr. Wulling then stated that he was glad that Dr. Asher had put it in that particular way, stating that he and his associates were trying to make the House of Delegates a good working body, and that he understood that the resolutions committee was the one to which the communication in question should go, and that the word "authorization" as used by Dr. Asher authorized the President to refer it to either the Council or House of Delegates.

The President then stated that it would be referred to the proper authorities, leaving it to the executive officer to determine.

Also, that the report of the Committee on Nominations would be the next order of business.

Secretary of the Nomination Committee F. W. Nitardy then stated that the Committee on Nominations met the day previous, after the first general session, and that the following nominations were made:

For President:

F. J. Wulling, Minneapolis, Minnesota.  
Charles H. LaWall, Philadelphia, Pennsylvania.  
C. H. Packard, Boston, Massachusetts.

For Vice-President:

Leonard A. Seltzer, Detroit, Michigan.  
Alfred B. Husted, Delmar, New York.  
C. W. Johnson, Seattle, Washington.

For Second Vice-President:

Charles Gietner, St. Louis, Missouri.  
L. E. Sayre, Lawrence, Kansas.  
Geo. H. P. Lichthardt, Sacramento, Cal.

For Third Vice-President:

Frank T. Green, San Francisco, Cal.  
R. A. Lyman, Lincoln, Nebraska.  
Philip Asher, New Orleans, Louisiana.

For members of the Council:

J. H. Beal, Urbana, Illinois.  
Wm. C. Alpers, Cleveland, Ohio.  
Wm. C. Anderson, Brooklyn, N. Y.  
J. C. Diaz, Havana, Cuba.  
W. H. Cousins, Dallas, Texas.  
J. H. Dawson, San Francisco, Calif.  
Harry B. Mason, Detroit, Michigan.  
Albert Bolenbaugh, Richmond, Virginia.

Julius A. Koeh moved that the report be adopted, the motion being seconded by W. H. Cousins, Texas, and the question being put, it was declared carried.

President Mayo stated that these names would be placed upon the ballot to be submitted to the members by mail.

The Chair then announced that the next order of business would be the reading of the minutes of the Council.

The Secretary of the Council then read the minutes, giving a short explanation of the changes in the by-laws embodied, among those enumerated being the following:

In Section one, Article two, the Secretary stated that the only change was that three months was given for the completion of the balloting, but that the member was required to return the signed ballot within one month after its receipt.

The Chair then stated that the articles could be passed on as read, although a little irregular, if there was no objection. A motion having been made and seconded, and the question put, the motion was declared carried in favor of three months instead of one.

The Secretary of the Council declared that Article 7 referred merely to the duty of the president and was simply an addition to the clause that the president shall announce the appointees on such committees as soon as possible.

The Chair then stated that the foregoing action was in line with the recommendation made by the President in his address.

Motion having been duly made and seconded, and the question put, the same was declared carried.

On the change with respect to the formation of local branches from 25 members to 15; the Chair stated no branch will have representation in the Council until it has a membership of 25, but that the branch could organize with 15 members under the proposed amendment.

The question was called for and the same was declared carried.

President Mayo then stated that recommendation No. 5 was purely executive; that it really simply justified what was being done.

The motion having been regularly made and seconded and the question put, the same was declared carried.

The Chair then stated that recommendation No. 6 on changing the word "Proceedings" to "Journal" was necessitated by the fact that the constitution was drawn up before the Journal was adopted as the organ of the Association, and due to a failure to make the necessary change when the Journal was established.

For a similar reason a change in Rule 3 was necessary, which at the present time provides that an abstract of the proceedings of the National Association of Boards of Pharmacy and the Conference of Pharmaceutical Faculties shall be printed in the Proceedings of the American Pharmaceutical Association.

A motion regularly made and seconded was unanimously carried, and it was so ordered.

On the section regarding the function of Historian, the Chair stated that the only question raised with respect to that article was as to whether the historian was to be merely a recorder of passing events or collector of such historical matter as is sent to the organization, or as to whether he shall be a historian who writes out history; that the function heretofore exercised by the Historian was that of collector of historical matter, and that it seemed wise for the Council to

follow the suggestion embodied in the article and to provide that the editor, who was practically a permanent official giving all his time to the business of the Association, should act in that capacity.

A motion to that effect having been regularly made and seconded, and the question put, the same was declared carried.

The Secretary of the Council then pointed out the change with respect to the general rules of finance stating that there were a number of changes proposed with respect to deposits in the bank.

President Mayo then explained that as the rule now stood the treasurer was required to make a deposit when it amounted to \$50, and that there were some days when the treasurer would be required to make a dozen deposits in one day if he obeyed the letter of the rule; that the change was intended to correct that phase of the situation.

Regularly moved and seconded; motion carried.

With respect to Rule 12, the Chair stated that the only change was the substitution of the word "February" for "January"; that it was necessary under the old financial system to have the auditing of the treasurer's and secretary's accounts done as early as possible; that the change suggested was merely for the convenience of the treasurer, who complains that he is so busy receiving dues in January that he would like to be granted two weeks additional time, and the Chair thought the members would be glad to favor the treasurer.

Motion duly made and seconded; carried.

The change with respect to the meeting of the auditing committee the Chair suggested was necessitated by the change previously made and the matter being put to vote, the same was declared carried.

The Chair stated that the change of Rule 12 provided for the printing of the list of all moneys received and the name of the person who had paid the money; further stating that this was done so that there would be practically a public accounting of the treasurer's report, so every member could look in the list of moneys received to see whether his money (the member's) was recorded in the treasurer's books. The Chair stated that this was unnecessary in view of the fact that the treasurer was under ample bond.

Treasurer Whelpley then stated that in lieu of the former provision he would be most happy to inform any of the members just exactly how their accounts stood at any time during the year.

The Chair stated that the Secretary of the Council had hitherto been paid his expenses in attending the meetings but that it had been done by resolution; that the Association had always hitherto paid the expense of the Secretary of the Council, that the committee was not adding any expense but simply making it a routine matter.

The matter having been regularly put to a vote, duly seconded, the same was declared carried.

The Chair then touched on Article 8, going into the history of the former cumbersome method of the payment of bills, stating that that method was no longer necessary because of the fact that the treasurer was under sufficient bond and that there was therefore ample provision.

The President then put the matter to a vote, and the same having been regularly moved and seconded, was declared carried.

The provision affecting the report of the committee of the Council to consider the question of representation in sessions of the House of Delegates was then presented, and fully dilated upon by the secretary of the Council, with a brief history of the action and discussions had upon the subject.

The Chair then inquired whether there were any further corrections desired in the minutes of the Council, and there being no response, the matter being put to a vote, regularly moved and seconded, the minutes were declared approved.

Treasurer Whelpley then addressed the session as follows:

The report of the treasurer, based on the fiscal year, January 1 to January 1, is submitted to the Auditing Committee and then published in the Journal of the Association, but it is a custom started by Mr. Sheppard, something like a quarter of a century ago, to submit at each annual meeting a summary showing the condition of the affairs of the finances of the Association at the time or near the date of the annual meeting, for aid in the matter of comparison.

I have followed the custom of closing this voluntary report with the first of July.

The finances of the Association may be divided into three parts, the invested funds, those funds are somewhat different in character, but in a general way the principle of none of them can be touched by the Association; of some, the interest cannot be touched until the amount is considerably more than it is at present; other interest can be used under certain conditions. Then we have the current funds of the Association, the money in hand to meet the ordinary expenses of the Association.

As a third class, the Association holds in trust various funds for specific purposes; some of these funds have been created by the Association as trust funds; others have been placed in the hands of the Association by other parties and the responsibility of caring for them has been assumed by the Association.

In some instances we had no definite instruction; that is to say, in some instances without any definite instruction or purpose as to the ultimate use of the funds or the interest that accrues.

On the 29th of July, 1915, the Association funds were as follows:

The Life Membership Fund—I will read these in round numbers—\$20,900, that is one of the permanent funds.

The Endowment Fund, \$6,200.

The Ebert Legacy Fund, \$3,300.

The Centennial Fund, \$2,900.

The Ebert Prize Fund, \$1,100, making a total of \$34,423. This is an increase of \$1,160.15, since the report submitted at Detroit, one year ago.

Treasurer Whelpley stated that the increase was entirely due to interest, and added that a detailed report of invested funds would be submitted by the committee at one of the general sessions, giving all that information.

The Association's current funds are divided into two parts, cash in the bank and available bonds; the available bonds amount to \$10,000; the cash \$6,247.65, giving us of current funds, \$16,247.65.

This, together with the permanent funds I just mentioned gives us a total of \$60,627.29.

Now, the funds held in trust by the Association are, first, the Procter Memorial Fund created by the Association for a special purpose, which now amounts to \$7,511.25.

The Rice Memorial Fund turned over to this Association by the Board of Trustees of the United States Pharmacopoeial Convention is \$172.06; and with the College Prize Fund placed in the hands of the Association by Dr. Motter of \$35.54 gives us funds held in trust amounting to \$7,719.55, so that the treasurer on the 29th day of July, 1915, is responsible to this Association for \$58,390.84.

I will again say that for a more detailed report of the treasurer, the one in which the expenses, or rather, the nature of the expenses and the nature of the income are shown, I refer you to the annual report published in a recent number of the Journal and covering the fiscal year which corresponds with the concluding of the year 1914.

The membership of the Association is interesting to all and germane to the work of the treasurer.

We have at the present time a total of 2,532 members; that is, our total membership. That membership is divided from the standpoint of the treasurer into paying members, the honorary members and the members that the treasurer has been unable to locate. That is the way the treasurer looks at it.

Now, we have 112 life members. These life members have become life members in accordance with the provisions of the constitution. Any member of this Association who will pay this \$100 any time during the first 10 years of membership will become a life member. There is a schedule of rates, payments for a longer period of membership, until a member has paid for 37 consecutive years—the statute of limitations of our Association prohibits him from paying any further dues—and the treasurer each year, in January, writes letters of a general form but of a personal nature to those who are entitled, by paying the membership of the year, to be placed on this roll and they are informed, having paid \$5 a year for the 37 years, that the member will be entitled to live as long as he or she desires without further payment of dues to the Association.

These letters have brought some very interesting correspondence, that time will not permit of presenting here, but I will say that many of our life members are among our most substantial members, some of them in attendance and others in work, and the 112 life members, while not contributing annually to the Association in funds, do contribute materially to the Association in general propaganda work.

The Association has 8 honorary members distributed over different parts of the world. I am sorry to say we have not heard from these honorary members during the last year. As a rule, we hear from a number of them each year, but conditions are such that correspondence is not facilitated.

We have 17 members that are known as life members. At one time this Association followed a custom of occasionally placing on a list known as "life members, old style" persons who had been in service for some time in the Asso-

ciation and desired to drop out or circumstances forced them out. As I said before, I believe, we have 17 members that are known as "life members, old style," and most of them are no longer interested directly in pharmacy, but each year the treasurer writes to them, each year a different kind of letter. This last year I wrote them that I had just had the pleasure of sending a little note to each one of the active members of the Association who were expected to pay dues for 1915; that it was a pleasure to me to state that the party addressed was not indebted to the Association for any dues but was expected to take an interest in the membership and contribute either a new member, or in some way give evidence of remembering that he was a life member of the Association, and that brought a large number of letters, and brought at least two new members to the Association; so, that while we are not adding to this list of life members, old style, we are keeping in touch with them.

The membership of those whose addresses are unknown is not large; it is 21 at the present time: That is, relatively speaking, very small because the vicissitudes of life for the pharmacist are such that they are likely to change addresses frequently.

One reason why this list is much smaller than it was formerly is because of the work of the Journal.

The post office sees to it that changes of address are reported to the editor of the Journal and he in turn reports them to the treasurer so that we are keeping that list down to a minimum.

Our foreign members number 44. These are distributed throughout the United States and the dependencies.

It may interest you to very hurriedly cover the list of states where the number of members have increased during the past twelve months: Alabama, Arkansas, Georgia, Indiana, Kentucky, Louisiana, Maryland, Michigan, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oklahoma, Pennsylvania, South Carolina, South Dakota, Texas, West Virginia, Connecticut—an increase of membership in all of those places.

I speak of that because it is very significant. It shows our membership increases over the entire country; that it is not due to any specific spurt of any one locality, but that we have a steady growth of new members over the entire district we cover.

I have the exact number of members in any particular state which I can give to any member who is interested or who desires that.

The Chair inquired whether the total was 2535.

Treasurer Whelpley then stated that that was the total according to the treasurer's books during the past year; during this period closing July 25 twenty-nine members died during the year.

The corresponding period previous we had only eighteen deaths.

Why this death rate should so materially increase is something the treasurer cannot explain.

I will say, in closing, that at the Detroit meeting last year I stated that the payments had been so prompt that the treasurer's mind was such that he, the treasurer, really felt he hadn't very much trouble in collecting dues; that he had missed some of the correspondence of previous years regarding delinquent dues.

Just previous to leaving St. Louis I received a letter from one of my good, substantial friends that at one time had been one of the delinquent members, and had received a chain of letters, and he said that he really missed them, and consequently thought the Treasurer was missing some of the enjoyment of his work, and so he held up his money and he said he collected my letters but now he returned them to me with a check of \$5; said he had enjoyed them and he freely inclosed the 12 cents postage and that he hoped he had contributed a little to the comfort and pleasure of the Treasurer in his work.

The Chair then asked what disposition the session desired to make of the report of the Treasurer.

Thereupon Wm. C. Anderson moved that the report be received and that it take the usual course; which motion was seconded, the question put, and it was so ordered.

President Mayo then suggested that the next item or number on the program was the reports of standing committees and inquired whether any of the chairmen were present.

H. V. Army, Chairman of the Committee on Weights and Measures, then stated that the report of his committee was ready.

The Chair then requested Chairman Army to present the report, which was submitted.

#### REPORT OF COMMITTEE ON WEIGHTS AND MEASURES.

Your Committee on Weights and Measures, in giving an account of its activities of the past year, can only report progress.

It will be recalled that at the Detroit meeting, held last year, the committee presented the following resolution, which was passed by the vote of the second general session of the Association.

*Resolved*, That the American Pharmaceutical Association is pleased to hear of a revival of a campaign aiming to make the metric units the official system of weights and measures in this country.

*Resolved*, That this Association, now, as in the past, stands ready to aid in accomplishing this purpose and hereby directs the next committee on weights and measures to co-operate with the American Association for the Advancement of Science, the American Chemical Society, the National Wholesale Grocers' Association and all other interested bodies in an educational campaign in interest of the metric system.

*Resolved*, That this Association take steps to enlist the support of the National Wholesale Druggists' Association in the proposed campaign on behalf of the metric system.

The lateness of the appointment of the present committee, coupled with the fact that the meetings of most of the national associations interested in the metric system will occur after this meeting of our organization forces us to limit our report to the expression of the hope that within the next few weeks there will be added recruits to the metric campaign.

Thus the resolution just cited has been formally submitted to Mr. T. E. Main, Secretary of the National Wholesale Druggists' Association, and there is every likelihood that resolutions of endorsement of the metric system will be passed at the meeting of that association, which will be held next month.

Through the co-operation of Professor Johnson, of our Weights and Measures Committee, the metric campaign has been brought to the attention of the Association of American Dairy, Food and Drug Officials, and the following resolution was submitted to that board and we have just heard that it was passed at the meeting of the association held in this city last week.

*Resolved*, That the Association of Food and Dairy Officials has heard with sympathy and interest of the proposed campaign of education on behalf of the metric system, looking toward the ultimate adoption of the system as the official standard of weights and measures in this country; be it further

*Resolved*, That this Association appoint a committee of five to co-operate with other national bodies in promoting such a campaign.

A similar resolution has been forwarded to President Herty, of the American Chemical Society, and under date of July 23d, we have received a letter from Dr. Herty, in which he promises to bring the matter to the attention of the association at the meeting scheduled to be held in Seattle next month.

Professors Johnson and Asher of our committee, have rendered valuable service in discussing the metric propaganda with those members of the committee with whom they are acquainted and find these gentlemen quite enthusiastic over the plan.

Your committee strongly recommends that the incoming committee continue the work upon the lines followed during the past two years. As things now stand, the national associations of grocers, both wholesale and retail, the National Cannery Association, the National Jewelers' Association, the American Institute of Electrical Engineers, the Association of Dairy, Food and Drug Officials, as well as our Association, have gone on record as favoring the metric system. We have every reason to believe that the wholesale druggists and the American Chemical Society will soon express their willingness to join in a metric propaganda. We believe that this association should go a step farther and we therefore recommend that resolutions, similar to those mentioned above, be submitted to the National Association of Retail Druggists, and the National Manufacturers of Medicinal Products.

If each of the eleven national bodies just enumerated agree to appoint a committee of five to co-operate with other national bodies in promoting a metric campaign, we believe that tangible results will ensue and that we will have the co-operation of the National Bureau of Standards, there is no doubt.

It will be recalled that last year this committee reported that the Bureau of Standards had not been heard from up to the time that the report was prepared. The presence of Dr. Wolfe at our Detroit meeting and the remarks that he made on the metric system, showed, however, the interest of the bureau in the subject, as does also the following letter from Acting Director E. B. Rosa, which was received after the adjournment of the Association last year.

August 15, 1914

I wish to thank you for the draft of your report as Chairman of the Committee on Weights and Measures of the American Pharmaceutical Association.

Your letter to Professor Wilson seems to cover the case very well. You understand that the demand for the metric system—to become effective in legislation—must come from the public. This is a popular government and the power resides in the people. The Bureau is organized to carry out the purposes of the constitutional provisions regarding uniform standards of weight and measure, and to fulfill the functions prescribed in its organic act. In the performance of these functions the superiority of the metric system is so great that we use it quite generally in our work. In fact, its intimate relation to many of the engineering quantities, such as electrical units and standards, makes it especially important that we use it. The Bureau is always glad to testify to this fact at any time. Congress is a representative body and naturally desires to carry out the wishes of the people who up to the present time have not, as a majority fully indicated sufficient interest in the subject, for or against the metric system.

Your idea of a campaign of education, therefore, is an excellent one since those most familiar with the metric system are its best advocates. With the present lack of knowledge regarding the system one could hardly expect anything but the existing status.

We note Professor Wilson's reply but do not find what action was taken by the American Chemical Society last April. Would it not be well to take up the matter with the Council of the Society again to ascertain what action, if any, has been taken, and what they will do toward such a campaign as you propose? I think it only needs some one who will make it his business to get a decision from each of these important societies to inaugurate the movement. The American Institute of Electrical Engineers would probably take an active interest in the matter.

Regarding the second point, i. e., the best action to be taken by your Association, it would be well for you to establish a permanent committee to prepare a report and resolutions embodying your wishes in the matter for adoption by your Society. In order that Congress may know what you wish to do it would be better for you to send to each congressman at each session a printed copy of your report and resolutions. This would keep the matter before them and if properly worded would doubtless be read by many of the members.

We are considering Professor Richards' suggestion as to the cumbersome names used in the metric system. This is thought by some to be a difficulty, but "avoirdupois pound" is quite as cumbersome as "cubic centimeter" and not nearly so descriptive. In order to be

free from ambiguity in the old system, probably as many syllables would be required as in the metric. Furthermore cubic centimeter is frequently called in the laboratory "cc." It is possible that the initials could be pronounced in other cases to advantage. I enclose sample of resolutions. A similar set might be prepared by your Association in which the pharmaceutical aspect of the system could be emphasized just as in the enclosed resolutions the educational point of view is taken. A similar set could be prepared for each society, emphasizing in turn the point of view of the special subject for which each society is organized.

So many individuals, associations and societies have urged us to take action that we feel as though there must be a wide-spread interest in the subject which only needs organizing to have considerable weight with Congress. If Congress should ask our opinion we would, of course, give a fair presentation of the advantages and disadvantages of the metric system in commerce and trade. How far it would be applied to the details of manufacturing would have to be determined by the interests concerned.

It is natural that the members of Congress with so many other questions to consider should not of their own initiative take up the subject of the metric system. It is somewhat technical, but if your congressman were willing to see you on the subject and to take enough active interest in it to become posted, it might be a good means of getting the congressional point of view. Representatives in Congress would doubtless listen more attentively to the views of the public, especially those who are interested in commercial, technical and scientific societies.

I would be glad to receive copies of all your resolutions and reports and can assure you of our keenest interest in the subject.

It might be pointed out that the officials of the bureau cannot well assume the responsibility of carrying on a metric propaganda, since there is a strong and influential group of metric antagonists, who have already criticised the officials of the bureau for the little they have done in the way of a metric campaign.

This leads us to the following questions: Assuming that the national bodies mentioned above get together in a metric campaign, how is such a campaign to be conducted? This was the main topic of discussion at a conference held on July 28th, between Chairman Drake of the Wholesale Grocers Metric Committee, Secretary Becker of the Grocers Association, and the chairman of our committee.

As a tentative plan it was suggested that the chairman of the committees, of the ten or more national associations, hold an informal conference, discussing ways and means and then report back to their several organizations. Whether a central bureau should be established or whether a less formal method of propaganda be followed, the parent bodies can then decide. In this connection, the activities of The Dental Association of Great Britain is worthy of comment, this being an organization of associations and individuals who are endeavoring to bring about the adoption of the metric system by the British Government.

Following the custom of the past, below is found a summary of news relating to weights and measures that has come to the attention of your committee.

It is of course well known that the new British Pharmacopoeia uses metric weights and that the committee of revision of the forthcoming U. S. P. has decided to use the word "milliliter" (ml) instead of cubic centimeter (cc.).

On January 4, 1915, there was introduced in Congress during the third session, House Bill No. 20,526, by Mr. Dillon, of South Dakota, making compulsory the use of the metric system in 1920. This bill died with the Sixty-third Congress, since it was apparently not backed by any of the national bodies enumerated above.

A national law creating a standard barrel for food commodities, of a capacity of 7,056 cubic inches, will go into effect on July 1, 1916.

One of the issues of *The Nation's Business* published during the past year, had a two-column article pointing out that the adoption of the metric system by this country has become a crying necessity if we are to enlarge our foreign trading, while in recent issues of the *New York Journal of Commerce*, there has been conducted an interesting discussion on the merits and demerits of the metric system.

In conclusion, Professor Timmons of our committee, points out the need of the legal examination of weights and measures on the prescription counter, not from the standpoint of fraud as our grocers and butchers scales are examined, but from the standpoint of health and life itself maybe, since a high degree of accuracy should be practiced in the dispensing of potent drugs. A campaign of this sort is now under way in Indiana and with astonishing results. That drug store scales and weights are not always accurate the reports

of sealers of weights and measures have indicated more than once during the past year, and it therefore behooves all druggists to give the accuracy of their weight- and measures their most careful attention.

Respectfully submitted,

C. W. JOHNSON,  
PHILIP ASHER,  
C. M. SNOW,  
G. D. TIMMONS,  
H. V. ARNY.

The Chair then inquired as to what disposition was to be made of the report of the Committee on Weights and Measures, suggesting that ordinarily the report was simply referred to the Committee on Publication.

Dr. Arny said that he desired to call attention to two recommendations, contained in the report, which he thought were both innocuous, and that there would be no difficulty presented in taking the same under consideration.

Dr. Arny stated that there would be some work required, part of which would be to assist in getting other associations in line. He thought there would be little difficulty, and also stated an effort should be made to have other national associations pass similar resolutions.

Mr. Frank H. Freericks then moved that the paper take its usual course and that the recommendations contained therein have the approval of the Association.

On motion regularly made and seconded, it was so ordered.

The Chair announced that the next matter to be taken up would be the report of the Secretary.

General Secretary W. B. Day said: My report will be very brief. I refer to the report of the Secretary. I wish to call attention to the fact that I have with me a stock of badges and bars, so that any of you who wish to be supplied, I will be glad to fill your orders as fast as I can, or take your orders for future delivery.

The general secretary then presented his report.

#### REPORT OF THE GENERAL SECRETARY.

To the President and Members of the American Pharmaceutical Association:

I have the honor to report on the various matters entrusted to my care during the past year.

##### STOCK OF PROCEEDINGS.

During the term of office of my predecessor, Dr. J. H. Beal, the stock of the publications of the Association was stored in the college of pharmacy building at Scio, Ohio. When, after Secretary Beal's resignation he moved his home from Scio to Urbana, Illinois, it became necessary to make other provision for caring for this property. At the last convention, the generous offer of Professor J. U. Lloyd to store these publications in the Lloyd Library was accepted. Therefore, your secretary made a trip to Scio in November, met Professor Beal there and arranged for the shipment of this stock of publications to Cincinnati, where they have since been stored at the Lloyd Library. An inventory of these publications is now being made, under Professor Lloyd's direction and is nearly completed. Although there has been some unavoidable delay, the stock is now in such shape that orders can be filled promptly. The sales of proceedings since September 1, amounted to \$77.42. The thanks of the Association are due to the Pittsburgh College of Pharmacy, who as the owners of the Scio College building, gave the free use of it to the Association for several years; also the Lloyd Library and to Professor J. U. Lloyd for their generous assistance in storing our publications and in undertaking to fill our orders from this stock.

##### YEAR BOOK.

The Year Book, Volume II, is finished and ready for distribution. It should be in the mails by this time. The printers, the Eschenbach Printing Company of Easton, Pa., have done well in expediting the publication. What delay there has been is due to no fault of theirs but to the time necessarily required to read and correct proof and to prepare the index. In view

of Reporter Diehl's years and the rather precarious condition of his health, it was deemed best that he should not work under any pressure but should be given ample time. The new Year Book will contain nearly seven hundred pages and will conform in style to the first volume.

#### NATIONAL FORMULARY.

Since September 1st, when my term of office began, until July 27th, 196 orders for the National Formulary have been received and filled. These orders aggregated 999 copies, of which 969 were cloth bound, 28 sheep and 2 sheep interleaved; 134 orders were for single copies only. The amount of the sales was \$1235.84. The collections during the same period were \$1278.10. The stock on hand in the various bindings is: Cloth, plain, 54; sheep, plain, 42; cloth, interleaved, 112; sheep, interleaved, 35; total, 243. Another lot of 500 to be bound in plain cloth has been ordered recently. There is outstanding in the ledger on National Formulary accounts, \$208.80. The expenditures on account of National Formulary since September 1, 1914, have been \$328.08, which, however, does not include the traveling expenses of the members attending the special meeting and amounting to \$249.57.

#### BADGES AND BARS.

I received from the former Acting Secretary, last September, 25 gold badges and 95 gold bars of various years. Three (3) gold bars were made to order last October and 20 were ordered for this meeting. One badge and thirteen bars were sold during the year, up to the 29th of July. (Four badges and 19 bars were supplied during this meeting.)

The stock of gold bars comprises:

2, 1894	15, 1896	3, 1899	5, 1905	2, 1910	3, 1914
13, 1895	4, 1897	13, 1901	1, 1908	27, 1913	17, 1915

In all 105 bars and 24 badges.

The receipts for badges and bars up to July 29th, have been \$14.10, expenditures \$25.10 (since September 1, 1915).

Receipts, September 1, 1914, to July 29, 1915 (ten months):

	National Formulary	Pro. and Year Book	Badges and Bars	Miscel- laneous	Total
October .....	\$251.67	\$ 5.50	\$ 0.80	\$10.00	\$270.97
November .....	105.04		13.50	2.50	120.84
December .....	55.59	5.08			60.67
January .....	75.55	49.94			125.49
February .....	160.47				160.47
March .....	252.91			4.00	256.91
April .....	47.29				47.29
May .....	103.50				103.50
June .....	186.65				186.65
July .....	36.43	16.90			53.33
Total .....	\$1278.10	\$77.42	\$14.10	\$16.50	\$1386.12

The instructions of the Association with regard to the publication of the combined program have been carried out to the best of the Secretary's ability, under rather difficult circumstances. It is hoped that the beginning so made—for this is the first time that such a program has been printed—will facilitate our work and enable the preparation of a fuller and more detailed program next year.

Respectfully submitted,

WM. B. DAY, General Secretary.

After concluding the reading of the report the General Secretary stated that he would like to present with the report a letter from Professor Lloyd which contains further information with regard to the stock of proceedings.

#### REPORT OF LLOYD LIBRARY.

To the Council of the American Pharmaceutical Association, at Its Meeting in San Francisco, August, 1915:

Gentlemen: I can report as follows concerning the documents of the American Pharmaceutical Association forwarded by Professor Beal to the address of the Lloyd Library:

One carload reached us safe, and was immediately carted to our warehouses, built by us to be as nearly fireproof as possible. Owing to the fact that there was no invoice of the publications, we could do nothing other than open the various boxes and assort the contents, which I will frankly say, proved to be a prodigious task. Inasmuch as this shipment occupied the entire floor space of two stories of our large warehouse, I can well comprehend

that it would have been impossible to accomplish this work in any private residence, or in any ordinary sized institution.

One of our librarians was given special charge of this work, and devoted her entire time thereto, sorting out the publications, putting them together systematically, tying them up into packages properly numbered and labeled, and otherwise arranging them according to library system.

Of each year's Proceedings, ten copies were reserved; the surplus of each year being carefully wrapped and packed in boxes properly labeled on the outside, so that at any time a librarian can put his hand on any volume needed.

A few boxes yet remain unclassified, of miscellaneous papers, unbound sets, prints, Journals, and other miscellaneous documents not concerned in the Pharmaceutical Proceedings. I would like instructions what to do with these. At present these are promiscuously mixed.

The accompanying report gives the entire stock unbound, cloth-bound and otherwise bound of the Proceedings of the American Pharmaceutical Association now existing in the hands of the Society. It will be observed that four years are entirely out of print, 1852, 1853, 1854, and 1859. Also that there are no bound copies of your documents for 1912, 1913, and 1914.

I have thus attempted to proceed according to directions given me, and hope that my efforts to accomplish the work may be satisfactory. It being the intention to place the ten copies of each year so that they may be at any time at the command of the librarian, I have directed a carpenter to build a series of special compartments that will hold the entire set, including blank spaces for the missing years.

Respectfully yours,

JOHN URI LLOYD, President Lloyd Library.

President Mayo: Gentlemen, you have heard the report of the Secretary. I might say for the information of those not cognizant of our methods, that all the financial portion of the Secretary's work is looked over by the same Auditing Committee that audits the Treasurer's financial accounts at the end of the fiscal year, and these financial accounts have been audited by this committee for the fiscal year as will appear later on.

A motion was then made, duly seconded, that the report be accepted and that it take its usual course; and it was so ordered.

Treasurer Whelpley then asked if he might have the privilege of moving a vote of thanks to the Lloyd library as well as for the very generous and efficient manner in which the property of the Association has been placed in serviceable form. Mr. Freericks seconded the motion and suggested that it be carried by a standing vote.

The Chair then said that it gave the President great pleasure, needless to say, to put the motion; that no one who had any experience whatever in handling accumulations of this kind but could appreciate the immense amount of work required and the especial skill necessary to keep matters in the proper shape and get desirable results; that those who had had the privilege of going through the Lloyd library were well convinced that it could not have been put in better hands; and that through the kindness of the Association's good friend and servant that the Association had this done, and therefore he acted on the suggestion of the seconder of the motion that a standing expression of thanks be tendered Professor Lloyd.

The Chair then called upon Professor Lloyd to say a few words.

Professor Lloyd said: I thank you for your kindness, and the evidence of thanks given the Lloyd library and I ask for information and instruction.

These books are not insured, nor is the Lloyd library; not one dollar of insurance.

We think our buildings are nearly fire proof. We know a fire company is very near to our establishment, but we have no method of valuing a property like that

and therefore we have not insured any document in our establishment. I refer to the Lloyd Library plant.

I would suggest that these books be divided; that the copies of each be kept in one location and one building, and that the Lloyd library be instructed to take the reserve stock to some other locality and store it, thus providing against an accident and perhaps a fire and the loss by water in case there be a fire.

It seems to me if this is accomplished there will be no reason to pay money out for insurance, although that remains for the Council to determine whether it is best to take out an insurance policy or not.

Treasurer Whelpley then moved that the matter of insuring the property be referred to the Council with power to act; which motion was duly seconded, and the question put, the motion was declared carried.

The Chair then stated that the day previous the President had failed to call on the President of the Pacific Coast Women's Pharmaceutical Association; that it was the first time the President had ever failed to call on a lady when he should have done so. But suggested if the lady was present the President and members would be very glad to hear her.

Mr. Wise stated that Mrs. White was the lady referred to by the Chair, that she was not attendant on the session; that she would be at the luncheon but was unable to be present at the general morning session.

The Chair then requested Mr. Wise to convey to the lady the Association's regards and keen regret for the president's failure in not calling upon her previously; informing the message bearer that she would be very, very welcome to participate in the deliberations and that the president would be glad to call upon her at any time.

Mr. Wise thanked the President and stated that he would so inform Mrs. White.

President Mayo then stated that it was always a peculiar pleasure to him to call attention to the fact when he found that a pharmacist had received recognition outside of the line of his own craft, and stated that the only pharmacist who has been made a state commissioner to the exposition was in the assemblage, naming the Association's dear old friend Professor Lloyd; the President stated that Professor Lloyd was one of the commissioners from the State of Ohio busily engaged here (San Francisco) in the work of the Ohio State Exposition building and activities in connection therewith.

The Chair then called upon Mr. Lloyd to tell the convention what interest there was to the pharmacist in the work attached to and involved in the appointment of Exposition Commissioner.

Again I have the opportunity of thanking you for giving me a chance to talk to you (laughter); but let me say to you that one of the opportunities of the pharmacist as commissioner in supervising the building of a world's fair building is that of missing many opportunities for rest and recreations and pleasures and adventures in the years that he is employed for that work.

I missed the meeting at Detroit by reason of this Panama-Pacific Exposition building commissioner allotment; and I have missed other pleasurable opportunities in that direction by reason of that work, and I would suggest, Mr. President, if you are asking for suggestions, that if any of that work should come to you, that you decline it, yes, decline the honors with thanks. (Laughter.)

Now, a few words: You gave me the privilege. Now, I will take the privilege to say to you young people who are here that you are all interested in the World's Fair Home Building. And don't forget that you who are from these various cities, don't forget to record your name,—Pennsylvania, New York, or whatever other state it may be—wherever it may be, record your name in your home building and take a little pride in it.

You do not know how we people who built these buildings—how we are interested in having a little attention paid to the work that we have done.

I speak for all of you. Now, the Ohio building was built by a pharmacist. He did not neglect the work and he sacrificed in all other directions. He even sacrificed his pharmacy work to accomplish that public work for the State of Ohio, he might say that his good friend Judge Harmon got him into it, ill-advisedly—so far as he was concerned, and, having accepted the commission he did it, but, never another one. One is enough, and I know when I have a plenty.

It has some pleasures attached to it, especially from the financial side. You are always expected to pay your own expenses, which is a pleasure, too.

Go to the World's Fair; go to each of the buildings that belong to your respective homes. If you have none, remember you have a home in the Ohio building. (Applause.)

If you can't find any home, go to our Ohio building; it may not be a \$750,000 building, but if you can't find a home anywhere else go to the Ohio building, there is a home for everyone.

If you are a member of the Ohio organization, if you come there by invitation, not by request, but by a right that you have to the Ohio building, record your name and after it "Ph. G.," that will please me, and the good deputy commissioner is always there, and he is a mighty fine fellow. And Mrs. Bryce, you young people all want to see Mrs. Bryce; go there and record your name. Say to the good commissioner, 'I am glad to come to the Ohio building.'

And after you have visited the Ohio building you can take your time and saunter around the other buildings ( am I right, Mr. President?)

President Mayo: You are always right.

Professor Lloyd (continuing): As one of the three commissioners I take great pleasure in inviting you, the members of the American Pharmaceutical Association, collectively or singly, with your families or not, at this time or any other time, you and your friends, to visit the Ohio building; and if you do this you will not regret it and you will very much please the State of Ohio and the associates of all the other states and California.

And among the other beautiful buildings you should not forget that magnificent great California building. Don't forget that—which you will get to after you visit the Ohio building. (Laughter and great applause.)

President Mayo: Professor Lloyd, I am sure that all the members will be very glad to accept your invitation. We will also accept your very kind advice to positively decline the honors with thanks when they come to us to serve as commissioners.

Now, the Chair has several announcements to make.

Ex-President Rusby came with a special party and wishes to announce that the special car which will be used by his party has a few remaining berths; this car will leave on Thursday, August 12, for Los Angeles, and then via Santa Fe Railroad, and expects to arrive in New York on August 28.

The Chair then announced that the next order of business would be the reports of general committees.

The General Secretary then stated that several reports had been placed in his

hands, but that it was his idea that some of these had better go to the sections, enumerating, for instance, the report of the Committee on Quality of Medicinal Drugs, stating that it was a printed report and quite extensive and the General Secretary assumed need not be read, but that it ought preferably be referred to the Scientific Section.

The Chair then suggested that the report in question be referred to the Scientific Section.

The Secretary then announced that Prof. E. L. Patch, who is chairman of the committee, had supplied a very limited number of reprints of this report, which the Secretary of the Scientific Section would distribute.

The General Secretary also stated that the Committee on Physiological Tests had handed in its report, which should go to the same section.

The Chair then announced that it would take the same course.

The General Secretary then announced the committee report on Status of Pharmacists in the National Government, stating that it was the belief that some of the pharmacists present at the session would be interested in hearing the report of the committee.

The General Secretary also read a portion of the letter of the chairman in which the chairman stated that he had purposely made the report short as there was little to report except to advise why the committee had not been able to secure the legislation desired, and expressing the wish of the chairman that the report would meet with approval.

#### REPORT OF THE COMMITTEE ON THE STATUS OF PHARMACISTS IN THE GOVERNMENT SERVICE.

To the President and Members of the American Pharmaceutical Association:

As chairman of the above-named Committee I herewith beg leave to submit the following report, showing the conditions existing with respect to pending legislation before Congress, looking to the improvement of the condition of the Hospital Corps, United States Army and the members composing same.

The past year Congress was overcrowded with work, incident to the war in Europe, and the anxiety of members of both houses of Congress to be able to get away and return to their homes as early as possible, they having been kept in Washington many months longer than usual by reason of the long special session of Congress. With the opposition that developed on the part of the Secretary of War and Chief of Staff, to the bills we had introduced by Senator Bacon and Mr. Hughes, it was found impossible to secure any consideration whatever from the Committee on Military Affairs or its sub-committee. Even the clear, strong appeal made by Col. Gandy, acting Surgeon General, when he appeared at the hearing held previous to the last annual meeting held in Detroit, seemed to make no impression on the members of the committee that something should be done for the members of the Hospital Corps, so that the army could obtain better men than they are at present able to do.

The Surgeon General's office has rendered us much assistance in the past and has been endeavoring to solve the problem whereby the opposition could be overcome, increase the efficiency of this branch of the service and better take care of the pharmacists. As yet they have been unable to devise anything that has not met opposition and while the task is a difficult one I feel sure that in time we can expect that some means will be devised that will prove satisfactory.

The granting of commissions to pharmacists has been strongly opposed from within, likewise have they opposed the provision of the Hughes bill creating a rank of Sergeant Major, for pharmacists, for the reason that it conflicts with the present class of Sergeant Majors. It would seem wise for the American Pharmaceutical Association to recommend to the Surgeon General, in the consideration of the question of the improvement of the status of the Hospital Corps and its members, that the rank of pharmacist be created and that this rank be equal to and equivalent of that of first lieutenant, if we are unable to secure favorable recommendation to provide for commissions for pharmacists of the Hospital Corps.

The coming session of Congress, which convenes in December will no doubt be very much overcrowded owing to many important questions incident to the European war. The

re-introduction of the Hughes bill would not receive any consideration, owing to the opposition of the Secretary and Chief of Staff, and as nothing better has as yet been suggested whereby all interests have been able to get together, I therefore recommend that the American Pharmaceutical Association use its best endeavors with the Surgeon General, looking to the framing of some measure that will properly take care of the pharmacists in the Hospital Corps; improve this branch of the army and at the same time overcome the objections that have been raised. The pharmacists in this branch of the Government Service are the only ones that have not received recognition.

Respectfully submitted,  
S. L. HILTON, Chairman.

The Chair then announced that Chairman S. L. Hilton, of the committee, and the members had touched upon a subject on which the president had devoted considerable space and attention in his own address, and if the convention would permit the Chair to suggest it, he thought it might be desirable to report the recommendations to the committee on president's address; that they might possibly like to consider the two recommendations in conjunction.

Dr. Anderson then moved that the report be referred to the Committee on President's Address, which motion was carried, and it was so ordered.

The General Secretary then announced that he had a letter from Mr. John F. Hancock, on the report of the Committee on Procter Memorial, stating his inability to be at the convention and extending his best wishes for the success of the meeting.

The General Secretary stated that the report was very short, and it was therefore read.

#### REPORT OF THE COMMITTEE ON WILLIAM PROCTER, JR., MONUMENT FUND.

The Committee on the William Procter, Jr., Monument Fund respectfully reports that the Chairman, accompanied by Prof. Jos. P. Remington, of Philadelphia, and Mr. W. S. Richardson, of Washington, D. C., have appeared before the Commission of Fine Arts of the District of Columbia in conference on the Monument to the late Prof. William Procter, Jr., which it proposes to erect in the Smithsonian Grounds at Washington, D. C. Remarks were made by the members of your Committee, explaining the plans and purposes of this Committee and that it was our idea to erect a Monument in keeping with those commemorating the life work of Dr. Gross and Dr. Rush, thus completing the plan to memorialize the three strong links in the History of Medicine in the United States—Pharmacy, Surgery and Therapeutics.

The Commission of Fine Arts decides the character of memorials that shall be erected in Washington, while the Congress of the United States gives permission for the site, and it was suggested that your Committee should petition Congress for the proposed site in the Smithsonian Grounds.

This application would have been made at the last session of Congress had it not been for the generally disturbed condition and the unusual amount of legislation before both the House of Representatives and the Senate. It was the advice of those Congressmen with whom we had been in conference that this application be deferred until the fall session of Congress. This application with the attendant bills will be presented as soon as Congress again convenes and we have every prospect of their early approval of our plans.

J. F. HANCOCK, Chairman.

It was then moved that the report be received and that it take the usual course, which motion was seconded, and it was so ordered.

The report of the General Membership Committee was then read, and the same action was taken with respect to that report; namely, a motion was made, seconded; carried, and it was received and ordered that the same course be taken.

## REPORT OF THE GENERAL MEMBERSHIP COMMITTEE.

To the President of the American Pharmaceutical Association:

The membership campaign has been carried on along the same general lines as last year. A large membership committee, comprising 227 members, was divided into eight geographic districts and into seven special sub-committees.

Extensive correspondence with the district chairmen and state chairmen was carried on. Lists of eligible persons were supplied and a vigorous effort made to materially increase the membership. That this effort has met with rather poor success is due no doubt to the general business depression and the unrest incident upon the European conflict.

In Nebraska, West Virginia and Maine there were *relatively* considerable accessions to the membership. New York, however, again leads in the *number* of new members elected.

As was pointed out by Chairman Packard a year ago, plans should be made to interest students of pharmacy during their college years. The suggestion is made that this might be best accomplished through the Journal, possibly by a concession in the subscription rates to students and particularly so if by co-operation with faculties, the valuable information presented in the Journal can be utilized in reference or supplementary reading as a part of the curricula of the colleges of pharmacy.

It is encouraging to note that the number of prize memberships offered to students in the colleges is steadily increasing.

It is hoped that action will be taken at this convention such as will facilitate the formation of local branches and aid in their development when formed.

The Journal reaches out to the membership everywhere. The branches afford local centers for the dissemination of progressive ideas in pharmacy. These two agencies will do much toward building up the membership when their possibilities are more fully realized.

The expense of the membership campaign has been for printing, postage and stationery, \$115.91. The number of new members elected since the last meeting is 304.

Respectfully submitted,

W. B. DAY, Chairman.

The General Secretary then announced that he had the report of the National Committee on the Pharmaceutical Syllabus; that it was a very brief report; also stating that the Secretary had a letter from Dr. Theodore J. Bradley, submitting the report, stating that the death of Mrs. Gregory and illness in his own family prevented either Dr. Gregory's or his presence.

#### REPORT OF THE SYLLABUS COMMITTEE FOR THE YEAR ENDING JULY 31, 1915.

Bulletin V.

To the President and Members of the American Pharmaceutical Association:

The Syllabus Committee of your Association respectfully submits the following report for the year ended on July 31, 1915.

The second edition of the Pharmaceutical Syllabus was issued during the spring of 1914 and 700 copies have been sold, mostly to members of state boards of pharmacy and faculties of colleges of pharmacy. The Syllabus has taken its proper place as a helpful reference book that is fast assuming an important office in the co-ordination of the work of the colleges of pharmacy and the state boards of pharmacy.

During the fall of 1914 the Journal of the American Pharmaceutical Association invited pharmacists to criticize the Syllabus and a considerable number of responses were received and published in the issues of December, 1914, and January, 1915. The opinions there expressed were almost invariably favorable to the Syllabus and the Committee was praised for the progress it has made towards the accomplishment of an exceedingly difficult task.

The Syllabus has now been formally adopted by a large number of the state boards of pharmacy as a guide in the preparation of their examinations and, in whole or in part, by many colleges of pharmacy. It is expected that a list of the boards and colleges that have adopted the Syllabus will be published soon.

The finances of the Committee are in a satisfactory condition, the liabilities being much more than balanced by the value of 300 copies of the Syllabus on hand, for which there is a steady sale, and of the electroplates for printing the books.

The Committee requests that your organization continue the annual appropriation of \$25 towards the necessary expenses of its work.

Signed,

WILLIS G. GREGORY, Chairman.

THEODORE J. BRADLEY, Secretary-Treasurer

(Detailed financial report to the Committee will follow, as Bulletin VI.)  
Boston, July 31, 1915

The Chair stated that the custom of the Association had been heretofore to have the initial steps in all matters pertaining to appropriations, taken by the Council, and for that reason it might be well to refer this recommendation to Council.

It was moved that the request for an appropriation of \$25 be referred to the Council, and upon motion regularly made and seconded, the same was carried, and it was so ordered.

The General Secretary then announced that he had the report of the Committee on Recipe Book, which was short, and the question arising in the general secretary's mind was whether the session would like to refer it to the Section on Practical Pharmacy and Dispensing.

It being regularly moved and seconded, to that effect, the motion being carried, it was so ordered.

The General Secretary also announced that he had a letter from Mr. Beringer inclosing the report of the Committee on Standards for Unofficial Drugs; that he did not know what was the customary action with respect thereto, but thought it should be referred to the Section on Practical Pharmacy and Dispensing.

The Chair then stated that that would be done.

The General Secretary also stated that Mr. England had a report for the Committee on Patents and Trade Marks; that it logically be referred to the Section on Education and Legislation; that there were a number of committee reports that had not yet been turned in and that possibly some of the chairmen of the committees were present, and might wish to make explanations.

On motion and on suggestion of the Committee on Editing Rules, the same was discontinued.

The General Secretary then announced that there was the report of the International Committee on Nomenclature, over which Dr. Alpers had supervision, and inasmuch as he had already stated that on account of the complication caused by the war and for other reasons the committee was not prepared to make any report. The president thought that the only thing now in order, with war in the air everywhere would be the discharge of the committee, and that he therefore suggested it.

The motion having been regularly made and seconded, and carried, it was so ordered.

The General Secretary then stated that the Committee on National Legislation, of which Mr. John C. Wallace was chairman, had not sent in any report; that Dr. Beal, Mr. Holzhauer, Mr. Hubbard and Mr. Hilton were the other members.

The General Secretary then announced that the report next to be heard from would be that of the Committee on Regulation for the Transportation of Drugs by Mail; that Mr. Benjamin L. Murray was the chairman.

Chairman announced that that report was with the Committee of the Section on Education and Legislation.

Secretary Day then stated that Mr. Freericks had an important announcement that he wished to make with respect to the session of the Section on Education and Legislation.

The General Secretary then suggested to President Mayo that there was yet remaining on the program the disposition of the Committee on United States Phar-

macopœia, of which Mr. Lackenbach was chairman, and the Committee on Time and Place of Meeting; the secretary also stated that he presumed the Committee on Time and Place would report at the last general session, as was customary, eliciting the information that Professor Remington was chairman.

Professor Remington then stated that he would like to say to the members generally that he had with him the first twenty-five pages of the United States Pharmacopœia in proof and had about 300 pages in galley proof, and that they were ready to be passed around to be inspected.

The General Secretary then announced that that concluded the general committees, the other committees being required to report to the Council.

The General Secretary stated that he believed that the Committee on Invested Funds reported to the Association, and inquired of Dr. Whelpley as to whether they had reported.

A gentleman then stated that they had reported to the Council.

Treasurer Whelpley then stated that it seemed as if quite a number of reports were required "not exactly from" the Treasurer but "on" the Treasurer; that an association gets at him from various angles; that the by-laws required that the Treasurer must, in company with a member of the Association, examine the bonds that are in the trust company vaults, and make affidavit with reference to the fact that the bonds are there, and that this had been done.

The Treasurer further stated that the Auditing Committee visits him and examines his books and compares them; then the Treasurer is expected to make an annual report for the fiscal year; in addition to that that he made his report to the committee, which was a supplementary report showing the condition of the Association financially at or near the time of the meeting; that in addition to this he was required to comply with Rule No. 14 of the General Rules of Finance of the Association requiring that a committee on invested funds shall make a full report at the annual meeting, which shall be read in full and published in the proceedings; that the Treasurer is an ex-officio member of the Committee on Invested Funds, and that being more familiar with the conditions, he submitted that report, which was really a report of the committee, and the report to which he referred but a few moments previous, as giving the title, detail and status of each fund.

That he would mention the funds in the order in which they were established, which was as follows:

The first one being the Ebert Prize Fund established by Albert E. Ebert at Indianapolis in 1875 when he was President of the Association; the Treasurer stating that Mr. Ebert gave the Association \$500, the interest of which was to be used in encouraging original investigation; that almost annually part of this interest had been used but that the accumulated interest added to the \$500 at that time amounted to a total of \$1103, merely going to show, the Treasurer pointed out, how interest counts up in the course of time.

The Centennial Fund was established by a balance left in the hands of the local committee in Philadelphia when this Association met in that city in 1876; the Entertainment Committee raised more money than they spent, although they endeavored to spend it freely and liberally; and that balance became the nucleus of

what is known as the Centennial Fund, the interest of which cannot be used but must be added to the fund.

At the present time that amounts to \$2,329.23; \$1,000 is in Massachusetts state bonds; \$1,800 in the Boston Penny Savings Bank, drawing 4 percent interest, and the accumulated interest makes up the total just read.

I should have said that the Ebert Prize Fund is in the Boston Penny Savings Bank drawing interest at 4 percent per annum compounded semi-annually.

The Life Membership Fund was next established and consists of the money paid by those who became life members by payment, in various sums, by some \$25, up to \$100.

The interest of that money for any current year may be used for any purpose that the Association may direct, but if it isn't used during that current year it becomes a part of the principle and cannot be touched by the Association.

The Life Membership Fund amounts to \$20,902.26. It is invested in Massachusetts state bonds and the interest is added semi-annually.

The Association holds in trust a College Prize Fund which originally consisted of \$25 placed in the hands of the Association by Dr. Motter, of Washington, for the purpose of giving annually for five years \$5 prizes for students in the National College of Pharmacy.

The conditions were such that no call has been made upon the fund and it has gradually accumulated until today it is \$36.34.

The money is in the Boston Penny Savings Bank drawing 4 percent interest.

The Endowment Fund was established by Mr. S. A. D. Sheppard and Dr. J. H. Beal, who jointly gave the Association certain sums of money and agreed to place in the fund one dollar for every \$20 that the Association or any member of the Association puts into this fund.

At the present time that fund amounts to \$6,184.77. It is on deposit in the Boston Penny Savings Bank drawing 4 percent interest compounded semi-annually.

The Board of Trustees of the United States Pharmacopœia raised a fund known as the Rice Memorial Fund, from which was erected at the grave of Dr. Charles Rice, in New York, a very fitting monument; from this fund was also published a memorial volume.

The small balance left on hand was carried by the Trustees of the United States Pharmacopœia for several years, and finally by vote of the Trustees and acceptance by the Council of the American Pharmaceutical Association was placed in the hands of this Association as a trust fund, without any specific limitations or directions. It is deposited in the Boston Penny Savings Bank where it was originally, and now amounts to \$172.06.

The Procter Memorial Fund established for the purpose of erecting a monument in Washington now amounts to \$7,511.25. Of this amount \$4,812.46 is a time deposit in the International Bank of St. Louis drawing 4 percent interest.

The balance is in cash in the International Bank of St. Louis. This certificate, of course, runs for twelve months, but the remaining balance, some \$2600, is kept in cash so that the committee can, when it chooses, at the appropriate time, draw upon the fund and the money can be used.

There is, however, 3 percent paid on this daily balance by special arrangement with the bank, a special arrangement that the Association has. Two percent is the ordinary amount, but we get three.

The Ebert Legacy Fund is a fund left by Albert Ebert to the Association by his will and amounts at the present time to \$3,330.39; \$2,000 of this is in St. Louis bonds and \$1,290.48 is in the International Bank in open account.

That covers all of the funds of the Association and this is a report of a standing committee on invested funds, really submitted by the Treasurer for the committee.

The chair then stated that Treasurer Whelpley was just like a gatling gun, compelling the Association to withstand his siege of report; that the report in question required so far as he knew no action, inasmuch as the work of the committee had already been supervised by the Auditing Committee, and desired to know what action the session desired to take upon it.

It was then regularly moved and seconded, and the motion carried, that the report be accepted.

The President then announced that the session would hear from Chairman Hyinson of the Committee on Organization of Local Branches.

#### REPORT OF THE COMMITTEE ON LOCAL BRANCHES.

To the Officers and Members of the American Pharmaceutical Association:

Gentlemen—The experience of this Committee is like many others; it did not receive notice of its appointment until late in May. This has made it impossible for us to be at all helpful to established branches, since their last meetings for the year are generally held in May or June. It has also made it difficult for us to seek the organization of new branches.

This delay in the organization of the various committees of the Association is a distinct hindrance to its effective work and leads us to suggest that since the President elect, under present conditions of election, has several months notice that it should be expected of him to have his full list of appointments ready for announcement when he is inaugurated and that such announcement be a part of the inaugural ceremonies.

As important and worthy of inclusion in this report, we offer a letter under date of January 8th, addressed to Mr. Joseph W. England, Secretary of the Council, to the Council representatives of the various branches and in addition we offer extracts from replies received by Mr. England to whom we are in debt for all this valuable matter.

Mr. England's letter is as follows:

From letter of J. W. England to Council Representative, Branch, A. Ph. A.:

At the final general session of the Detroit meeting (Journ. A. Ph. A., 1914, 1495), the following resolution was adopted:

"The recommendation of the president to reduce the number of members necessary for the organization of a local branch from twenty-five to fifteen, and that the Chairman of the Committee on Local Branches should provide a bulletin to be issued to the local branches suggesting topics of importance for discussion."

As the first part of the above resolution is in conflict with Chapter XII, Article 1, of the By-Laws, on Local Branches, and these were not amended at the meeting, it is, of course, inoperative; the latter part of the resolution, however, is in full force and effect.

President Mayo has not yet appointed the Committee on Local Branches for 1914-1915, but will do so shortly, and the committee will then doubtless issue bulletins and send topics for discussion to the Local Branches.

In the meanwhile, the thought has occurred to me that it might be well if we could devise some scheme to encourage and co-ordinate the work of the seventeen different branches. How would it do for the Committee on Local Branches to select six or more subjects for papers each official year, or ask six or more experts to select subjects, and have each one write on the subject he selects? Then, each month, seventeen copies of the paper for the following month could be sent to the local branches (with the exception possibly of the local branch to which the author belongs). Each branch would then receive, each month, an original paper from an outside source, which would stimulate attendance and stimulate the work of the local branch.

It must not be forgotten by those of us in the large cities that the members of some of the local branches do not have the extended facilities for research work in pharmacy that members of the larger cities have, and hence cannot prepare comprehensive programs, but if they could have the assistance of the members of the Association at large, they could make their programs more appealing to a larger number of their own membership.

With the nearly 3000 members of the Association—and leaders in all lines of pharmaceutical research—it should not be difficult to get six members of the Association, each year, to write a paper for the Branches, especially in view of the wide publicity that would obtain for the writer. The Branches as a rule, do not have more than six meetings a year and the papers could be upon scientific, educational, legislative, historical or commercial topics, as deemed best by the Committee on Local Branches.

Of course, the danger may be that the members of the Local Branches who write papers may "lay down on their jobs" if the Branches receive outside assistance in securing papers, but I do not think so. I believe that the service proposed would stimulate research instead of repressing it.

Furthermore, it seems to me that the Committee on Local Branches could well adopt the admirable plan used by Chairman E. Fullerton Cook this year for the Philadelphia Branch of having presented each month at the Branch Meeting a systematic "Review" of current pharmaceutical journals of the previous month. This has been well received at the Philadelphia Branch meetings, and one "review" could serve for each of the seventeen Branch meetings.

The suggestions above made would not interfere in any way with the resolution of the Association that the Committee on Local Branches send bulletins to the Branches suggesting topics for discussion; in fact, they would be really supplementing and strengthening the work of the committee.

Will you make inquiry of the members of your Branch and ascertain how they are impressed by the above suggestions? I have no desire to suggest anything that will interfere with the individual work of each Branch; my only thought is to utilize the great ability of the members of the Association at large for the benefit of the members of the local Branches.

The replies are in part as follows:

E. H. THIESING of Cincinnati Branch:

"Your suggestion with regard to having six experts write papers on selected subjects, these to be read at the Branch meetings during the same month, appears to me an excellent one. Together with the topics offered by the new committee, it will form the nucleus for a year's program that will not only co-ordinate the work of the Branches, but will encourage them. Have spoken to some eight of our members, all of whom view the matter in the same light.

"To have something special during the winter, was in mind when the program for the Cincinnati Branch was prepared. It provides for a paper by some well-known person in Pharmacy each alternate meeting—the meeting between being reserved for papers and discussions by local members, and reports of committees, one of which is a review of current pharmaceutical journals under the title of "Progress of Pharmacy."

The special papers for the year are from Prof. John Uri Lloyd, Prof. C. T. P. Fennel, Dr. Beal, Dr. Anderson, Dr. A. O. Zwick, Frank H. Freericks and Julius Greyer.

S. L. HILTON, District of Columbia Branch:

"You are doubtless aware that the conditions here are probably different from those of any of the other Branches; it is impossible to interest the retail pharmacist, other than six or eight, but we have no trouble in interesting the many scientists in the Government service and have succeeded in securing many valuable papers; we, therefore, have to continue along these lines if we may expect to do anything and accomplish any work of a scientific nature."

J. M. ROGOFF, M. D., Nashville Branch:

"The suggestions made in your communication meet with the hearty approval of all who are interested in the progress of pharmacy, and I am sure that "outside papers" could have nothing but a good effect on the interest of the local members, and would not depress their present efforts in research.

"I have attempted to incite the interest of our local members by giving a series of papers, discussing the methods and simpler tests applied in physiological chemistry. My first paper was read at the February meeting and I considered the simplest methods of gastric analysis, showing how the pharmacist could do this kind of work for the physician and add a profitable 'ethical side line' to his store. The younger men in the profession (non-members) were invited to be present, and Dr. Ruddiman invited the students of the Pharmacy Department of Vanderbilt University, who were also in attendance.

"I believe that this paper awakened the interest of a number of the more intelligent pharmacists and particularly the younger men who are being better trained than some of the older men in the profession and that it has merited an attempt on my part to prepare another paper in this series to follow up the first one."

FREDERICK J. WULLING, Northwestern Branch:

"I like the suggestions embodied in your letter immensely and will bring the matter before our next Branch meeting."

CHAS. T. P. FENNEL, Cincinnati Branch:

"We aim to have two or three illustrated lectures on subjects of interest to all, but without discussion. The last lecture was given by myself in November, 1914, History of Chemistry, with about seventy-five slides. The subjects for discussion are selected from topics selected by individual members for elaboration and obtained through a committee of three. In response to the request of the committee, subjects for at least six meetings have been obtained. Last year I had charge of Progress in Pharmacy, but we had so many topics for discussion that only one meeting was devoted to the department. This year Mr. Jones has charge of this department, the first installment to be presented at the coming meeting, January 12, 1915. We devoted one evening to discussion, "History," by Prof. Lloyd. Preparations and Assays by Theo. Wetterstroem, Merrell, Jones and myself. Recent Phar. Legislation by Mr. Freericks, and general discussion. Illustrated Lectures by Dr. A. O. Zwick without discussion. In all these programs no written papers were presented, although the authors had 'follow-up' notes.

"I believe your suggestion of exchange papers could be worked up with general benefit. I shall present the matter to the Association at the next meeting."

H. M. WHEPLEY, St. Louis Branch:

"I read with much interest your letter of November 18, regarding local branches. I hope you will work out a scheme whereby we will have greater co-ordination between the branches. Some one should keep tab on the branches. As it is now, they seem to grow up very much as did Topsy. They can be seriously ill without professional attendance and care and even die without its being observed.

"I like your plan of having papers written to be read at the various branches."

In our opinion, the suggestions of Secretary England and his interested correspondents offer much that will be helpful to our members.

The status of the local branch has received the serious thought of the Chairman, especially in relation to the correlating of the various important pharmaceutical organizations, both state and national, also when considering the size and the personnel of the Council membership. In his opinion the local branch has a place of great usefulness in the Association work. They are, or should be much like the various sections, neither administrative nor executive, but forums upon which developing discussions may be held, the conclusions from which may be carried into the several sections. Like the Sections, it would seem they should continue to have representation in the Council, which will in all probability become the executive body of the Association for the concentration and crystallization of the instructive work of the organization.

To offset the claim that the Council is too large, the opinion is offered that the Council cannot become too large, if each member represents a distinct unit peculiar to itself. It can only become too large, and is already too large, for its proceedings to be conducted by mail.

The several annual meetings should be held and *ad interim*, its affairs, administrative and executive, should and must, it is thought, be left to an Executive Committee of not more than seven members. This is offered to the Committee in answer to the question: "Shall the local branches continue to hold membership in the Council?" and we answer positively, yes!

(Signed) H. P. HYNSON, Chairman.

Chairman Hynson then stated that the suggestions of Mr. England were well worthy of consideration and that they had the endorsement of a number of the council members of the different branches, and he thought that while it would take quite too much time to read all the recommendations, that in his opinion they should be referred to the Committee on Publication for revision and publication; that he, Mr. Hynson, personally thanked Mr. England for his good work and he hoped that every member would do likewise.

Further extracts were read from the letter of Mr. England, and Mr. Hynson suggested that the writer ought to have the privilege of re-writing the report.

The Chair then stated that the session would give the author that privilege, further stating that the session would then hear from the Committee on Organization of Branches, asking whether they had any recommendations.

Mr. Hynson suggested that the only recommendations were simply those em-

bodied in Mr. England's suggestions; that the other members of the committee endorsed them; and that the Committee on Local Branches was seeking papers which would be distributed to the local branches; stating that he believed the chairman requested that it be referred to the committee for publication; that if the idea met with favor that the present Committee on Local Branches should be authorized to carry it into effect next year, whatever committee was appointed. Inasmuch as they had seventeen local branches that they could get a half a dozen of national representatives, each one to prepare a paper, someone with national reputation, of more than usual importance; that seventeen copies could be stricken off and sent to the branches; that it would suggest a new feature; that it would be information from an outside source, in the nature of a message from a national source.

The Chair then stated that the idea was to stimulate research work and work along that line by co-operative work; that the suggestion offered in the Council letter by Mr. England had attracted attention generally; that it seemed to the Chair that the way to put it into effect would be to refer the recommendation with favorable endorsement to the incoming Committee on Local Branches of the American Pharmaceutical Association.

Mr. Hynson made a motion, which was duly seconded, that the report of the committee be accepted; that the recommendation regarding co-ordination of the work of the local branches be referred to the incoming Committee on Local Branches with favorable endorsement; the motion was carried, and it was so ordered.

Mr. England stated that his attention had been called to Rule Fourteen which pertained to the Committee on Invested Savings and Trust Funds, and moved that Rule Fourteen on invested savings and trust funds, third paragraph, be amended by deleting the words "in the annual volume of proceedings thereof," in the last line, and the following be substituted therefor: "In full in the Journal of the American Pharmaceutical Association."

Motion seconded; carried.

General Secretary W. B. Day then stated that the Chicago Branch at its May meeting recommended to the Association that they request the Committee on National Formulary to reconsider the deletion of all diarrhea mixtures in the Formulary, the idea of the Branch being that at least one of these diarrhea mixtures be retained. The Secretary stated that he was not altogether certain as to just what the practice was in that regard, but proposed that it should be referred to the Committee on National Formulary.

In reply to which suggestion President Mayo stated that the Committee was a committee of the American Pharmaceutical Association, and would presumably carry out the wishes of the American Pharmaceutical Association. That such deletion affected the sale of popular remedies, and that it would have a very important bearing on the ordinances of New York City. It seemed to the Chair that it was a very grave thing to delete all of those preparations, as in the opinion of the Chair they had a legitimate field of usefulness; and that the matter should have careful consideration.

President Mayo then acquainted the session with the fact that it had been rec-

commended by the Chicago Branch that the Committee on National Formulary be requested to reinstate at least one of the popular diarrhea remedies and that it was before the session for discussion and action, stating that Professor Scoville was present, and that the session would be glad to hear from him.

Mr. Wilbur L. Scoville stated that the real reason back of the proposal to delete the diarrhea remedies was based on the fact that they had a therapeutic name and the Committee on National Formulary voted to eliminate all diarrhea formulas; that it did not seem possible under the present arrangement to include them, so they were deleted; that not much consideration had been given to the legal point of remedies themselves, and that if the Association thought they had better remain, that matter could easily be adjusted.

Mr. Hynson then stated that in his opinion the Harrison Act had something to do with the matter, and put the question to Professor Scoville if it wasn't a fact that the deletion occurred after the passage of the Harrison Act and that that had something to do with it.

Whereupon Professor Scoville said, not so far as he remembered; that it occurred after the passage, but as he remembered it, did not have anything to do with it, but possibly that was a factor. Whereupon Mr. Hynson stated that in his opinion it was a factor.

Dr. Joseph Weinstein then stated that he believed the deletion of remedies of that kind was a mistake, because the pharmacists were restricted in the sale of narcotics. That so far as it concerned those diarrhea remedies having a minimum amount of narcotics, they would be allowed to be sold in the drug stores, had they been included in the National Formulary. The fact that they had been removed from the National Formulary would do away with a lot of sales which were allowed the pharmacist, occurring in the transaction of the pharmacists' legitimate course of business. The speaker thought that if there was any possible way in which they could be included in the National Formulary again that it would be a proper step in the right direction, because as the matter worked out at the present time the pharmacists were in many cases losers where legitimate sales could be made.

Professor Scoville then said that as one of the members of the National Formulary Committee and one who had voted to delete, his attitude regarding the point in controversy was, that in a very large number of the cases where opiates were contained, and according to the modern therapeutic dose, those things were not sufficiently indicated in those cases. The speaker thought the subject was a very broad one, and was possibly due more consideration than had been given by the Committee, and thought a motion recommending deletion should be passed by the Committee, and stated further that as one of the members who voted for the deletion he would be in favor of taking action to restore. That the question presented two phases, first of all the consideration of the subject before the session, and second, the relationship of the National Formulary Committee, and that if the committee should receive orders from the Association, the speaker thought that every one would readily see that it was a dangerous precedent, but in this particular case believed that it would really be a suggestion from the Association and its influence would be very great and the speaker would vote for restoration.

Mr. Hynson then stated that they should be deleted because it could not be sold under the Harrison law; inquiring what was the use of having them in there if they could not be sold in the United States; and the speaker thought as a perfectly sensible and logical proposition that there was no use in having them in the Formulary if they could not be sold over the counter, and surely not, if they could not have the recommendation of the physician.

Whereupon Dean Wulling stated that that was his understanding, and stated that he concurred in the opinion of Dr. Hynson. That it was voted in Minnesota that the formulas be so modified as to come within the Harrison law; that that of course would not be the original formula, but closely approaching it. The speaker thought it was not necessary to reconsider because the prescription could not be sold except on order of a physician, but in the speaker's opinion it might be necessary for the American Pharmaceutical Association to do some research work on other formulæ to come within the law, if the trade required it, as Mr. Hynson suggested.

Mr. Osseward stated that he agreed with Mr. Hynson fully, that as long as the pharmacist could not sell it over the counter and that it could only be dispensed on a physician's prescription, that it would not be logical to restore; that if the physician desired it he could write out the entire formula.

The Chair then stated that the session would like to hear the views representative of the Chicago Branch as to what the Chicago Branch thought on that question.

Professor Snow stated that the idea, he believed, was advanced at the Chicago Branch that most of the members of the National Formulary Committee were of the opinion that most of the people who discussed these preparations were people from the cities, who did not appreciate the conditions of medical practice in the country. That while everyone agreed that if the physician desired to prescribe a preparation of that kind he should write the prescription, yet there were many who desired these preparations, who were not able to do so. He suggested that there were many physicians in the country who depended upon the Formulary, citing the instance of Squibb's mixture and preparations of that kind; that they became quite popular in the practice of medicine and the speaker believed that would not be denied by anyone. The fact that they had become so popular had lead the members of the Chicago Branch to ask a restoration and the retention of at least one of the preparations and possibly two.

The speaker further stated that no longer ago than April, Professor Remington in Chicago gave an indication of the value of those preparations, where he himself was forced into the practice of medicine in the absence of a physician, and claimed, while not exactly working a miracle, to have done wonders for an old lady with the Squibb's Cholera Mixture. Everything seemed to indicate to the speaker that they should retain them in the National Formulary; that if they could not be sold, the speaker urged, it certainly would do no harm to be embodied in the Formulary; that the physician who could use them on prescription would make good use of them.

Dr. George C. Dickman stated that he thought the argument of Professor Snow was a very sound one. If the other argument was a good one that they be deleted

from the National Formulary, pointing out that if they were eliminated from the Pharmacopœia they could not be sold either, and therefore he could not see why they should not all be deleted.

The speaker stated, however, that they should not be in the Pharmacopœia if they can not be sold under the Harrison law, but believed the point concerning the country practitioners very well taken; and reminded the session that a propaganda was widely afoot to get the physician to use the National Formulary and United States Pharmacopœia, particularly throughout the country districts; that it was the speaker's belief that the Association was trying to get physicians to use these books, and he, therefore, thought the preparations should not all be deleted, at least one of them retained.

Dr. Anderson then suggested that in his opinion a motion had not been made and that the whole discussion was rather irregular, and that he therefore desired to move the approval of the recommendation from the Chicago Branch, stating that he had never understood that the formulæ in the National Formulary were placed there for the purpose of having the preparation sold over the counter to the public; that it had always been his idea that they were for the physicians' use, and that the propaganda of the American Pharmaceutical Association had been along that line, namely, to get physicians to use the N. F. and U. S. P. That where they did not want to go to the trouble of writing out certain preparations they had access to some ready formula in the National Formulary which they could prepare; that in the speaker's opinion it was something that the physicians needed, and that he believed that it was at least proper to ask the Committee to reconsider the proposition and if possible have them conform to the recommendation of the Chicago Branch, endorsed by the Association.

The motion of Mr. Anderson was seconded.

Thereupon Mr. Hynson offered a substitute to the motion, viz.: That the matter be referred to the Section on Practical Pharmacy and Dispensing, where he believed it belonged; and therefore, the speaker suggested, he would place his thought in the form of a substitute to the motion, that it be referred to the Section on Practical Pharmacy and Dispensing, where he stated the report of the Committee on National Formulary went for further consideration.

The seconder stated that he had just talked to Chairman Osseward, and stated that Mr. Osseward thought that the proper place for the matter was in that section.

Thereupon Dr. Anderson stated that he would willingly accept that amendment.

Dr. Wulling then stated that it struck him as hardly necessary, as the views had been generally expressed rather fully in the session then in progress, and that in his opinion it could not be gone into any further, unless the speaker was in error. He could not see the practicability of postponing the matter by referring it to another section, inasmuch it could not be decided upon until it again came to the general session for action.

The Chair then stated that it was apparent that the general session had a perfect right to pass upon any subject it chose, and that there would be no impropriety in considering it at that time before the session then in progress, no objection whatever in taking definite action or the alternative of referring it to the Section

on Practical Pharmacy and Dispensing; but the Chair reminded the session that there were two motions before the house, the original motion to recommend to the Committee the compliance with the request of the Chicago Branch and the substitute motion to refer the matter to the Section on Practical Pharmacy and Dispensing; that it was entirely in the province of the parent body to act on the proposal, and that it was also entirely appropriate to vote on the substitute motion, the motion of Mr. Hynson, and therefore he put the question, which was carried in the affirmative, Mr. Hynson being the only dissenter. (Mr. Hynson desired that his vote be recorded.)

The Chair then stated that the body had arrived at the point where it was necessary to take some action on the original motion, and stated the original motion to be that the general session of the American Pharmaceutical Association request the Committee on National Formulary to reconsider its action in deleting all the diarrhea mixtures and to take into consideration the request of the Chicago Branch; putting the question, it being recorded that the ayes had it.

Mr. Hynson then stated that he desired to rise to a point of personal privilege, and the Chair stated that the floor was Mr. Hynson's.

Mr. Hynson then said that he desired to point out the reason he desired action on the matter was that he had great love for pharmacy and great respect for it, and he wanted pharmacy to be respected by other professions, and he thought the deletions of these mixtures, which the speaker said were obsolete and unscientific, constituted a direct reflection on the American Pharmaceutical Association. The speaker said he hoped that the assemblage would think about the subject and hoped that it would take it to heart as he felt that they had slapped the committee in the face, who, the speaker thought, had taken a step which was very creditable to the American Pharmaceutical Association and creditable to the Committee on the Revision of National Formulary, and the speaker added, that he was very glad to go on record in that particular way in which he did.

Dr. Rufus A. Lyman then stated that he desired to call attention, while supporting Mr. Hynson's idea, to the general trend that the general session was taking; that the night previous there was brought before the House of Delegates in the session a recommendation to the American Medical Association that they do something more than they are now doing to introduce prescription writing into the medical school in order that medical men might be better prepared to write prescriptions.

Dr. Anderson then stated that it appeared to him that the House of Delegates in taking the action it did and the association taking the action contemplated, that it was acting very consistently; that the association was calling the attention of the medical profession to the fact that the men in the medical profession today did not know how to write prescriptions, and that therefore that they become better equipped in methods of prescription writing; that the Association was calling upon the American Medical Association to make provision in their colleges to have the future physicians write these technical prescriptions so that the pharmacist could do away with the formularies.

Mr. Hynson then stated that he desired to know whether Dr. Anderson knew of any reputable physician in the State of New York who was prescribing these

diarrhea mixtures, whereupon Dr. Anderson stated that there were hundreds of them, and that he could take Mr. Hynson to his prescription files and provide Mr. Hynson with the names of some of the most reputable physicians in Brooklyn. Mr. Hynson stated that the situation did not exist in Baltimore.

Secretary W. B. Day stated that in the Council they had the pleasure of listening to a splendid report by Dr. Beal for the Commission on Proprietary Medicines. The Commission presented a number of definitions for proprietary medicines so as to classify them, and as he recalled, one of the definitions included the use of the name which indicated the disease for which the medicine was to be prescribed. That it occurred to him that there was just a possibility that the Association might put some of its N. F. medicines in the class of patent medicines if there was a retention of the names covering the diarrhea medicines, and suggested that the National Formulary Committee not reconsider the matter but try to change the name so as to avoid the therapeutic name.

President Mayo then stated that there was special business on the program, had been on it for a number of years, but had never been carried out, the feature of the introduction of new members to the Association; the Chair adding that it was highly desirable that there be as much personal intercourse between the members during their stay as possible, and highly desirable that all members acquaint themselves with each other.

The Chair then inquired whether there were any members who had not attended the meetings heretofore, and thereupon the following were introduced: J. M. Bladen, of Cedar City, Utah; J. C. Buckner, of Galveston, Texas; J. H. Brinker, of Bellevue, Ohio; Hugh B. Secheverell, of Denver; E. C. Eaton, of San Francisco; W. H. Cousins and C. Benkma, of Dallas, Texas.

President Mayo further suggested that this procedure went down as part of the proceedings of the session, had never been carried out before, and thought it was a good feature.

President Mayo then stated that he took extreme pleasure in introducing to the assemblage Dr. Morgan, of San Francisco, or rather of Half Moon Bay; also J. L. Lengfeld, of San Francisco, stating that Dr. Lengfeld was a very good member.

General Secretary W. B. Day reinforced the statement by adding that Dr. Lengfeld had brought in many new members, and the Chair added that Dr. Lengfeld's name was familiar because of his having acted in the capacity of proposer of new members.

Espying some ladies in the rear of the room, the Chair inquired whether they were new members; and Dr. Anderson suggested that it would be very well in any event that the ladies be introduced.

Dr. Hynson then arose to say that he desired to introduce a lady, a very fine lady, a graduate of pharmacy with high standing and a member of the American Pharmaceutical Association, also from Baltimore; adding that in his opinion the lady was too modest and evinced the hope that everyone would meet her.

Mr. Hynson then introduced Miss Ollie Kohl.

The Chair then addressed Miss Kohl, stating that he welcomed her to the membership of the Association and trusted that she would call upon any of the members at any time for any service they might be able to render, and that they would all be at her service.

Mr. Dawson arose to state that Mr. Morgan would like to say something about the trip to Half Moon Bay.

Mr. Morgan then stated that Mr. Dawson was wrong in saying "Trip to Half Moon Bay," but if a number of eastern visitors would like to make an automobile trip covering a period of five hours, taking the entourage to Stanford University and back, that Mr. Morgan would be glad to make arrangements for some of them.

Dr. Morgan said that by leaving San Francisco at 8 o'clock in the morning the party could be back at 1 o'clock and that it was a very beautiful trip through the peninsula, to Stanford University; that it happened that the speaker was a commissioner at the exposition and could promise everyone free automobiles for the trip.

A motion was then regularly made to adjourn, being duly seconded and carried, declaring the second general session adjourned until Friday, August 13, 1915, at 10:30 o'clock a. m., in the Red Room.

#### MINUTES OF THE THIRD AND FINAL GENERAL SESSION.

The third and final general session of the convention of the American Pharmaceutical Association was held in the Red Room of the Bellevue Hotel, San Francisco, California, on Friday, August 13, 1915, at the hour of 11:30 a. m. President Caswell A. Mayo called the meeting to order.

The Chair stated, before proceeding with the business of the general session, that a Council meeting would be held immediately after the adjournment of the third and final general session to dispose of one or two items left over.

The Chair then called upon Secretary W. B. Day to read the minutes of the second general session, which was done.

The Chair then inquired whether there was any further correction in connection with the minutes, and there being none, the Chair announced that the minutes stood approved as read.

The Chair then announced that the reading of the minutes and the presence of certain persons in the room directed his attention to some unfinished business holding over from the first general session, and President Mayo then called upon Mrs. White, the President of the Pacific Coast Women's Pharmaceutical Association, to tender the greetings of that body.

Mrs. White then thanked the membership present in the name of the Pacific Coast Women's Pharmaceutical Association for the kindness of being permitted to address the American Pharmaceutical Association; and further that it gave her an opportunity of thanking the editors of the various pharmaceutical journals for their kindness in always publishing anything in the shape of notice or editorial that had reference to their organization.

President Mayo then stated that the Association had with it the Local Secretary of the California Association, who officiated at the meeting of the American Pharmaceutical Association held in San Francisco in 1889, and took great pleasure in introducing Mr. Edward W. Runyon; and remarked that to those who had the pleasure of being in San Francisco at that time and partaking of the hospitality that was so freely dispensed by the members of the local organization, the hope

of a repetition of that hospitality largely influenced the Association in again selecting San Francisco as the place of meeting.

Mr. Runyon said that President Mayo always tried by some art or device to get the speaker on his feet; but that he was happy to be again in dear old Frisco, where he landed thirty-seven years ago; and rejoiced that at his side was an old pupil of his, Mr. Gato, of Merced. He called attention that wonderful San Francisco with its beautiful buildings and artistic spots was a transformation of a place he once knew where the streets were covered with planks, paved in that old archaic style, with the planks placed on top of the sand, and at that time the fleas were as numerous as the grains of sand. He reminded his listeners that it took him back to a picture of that hard-working little band of fellows who worked so heroically back in the early '70's and early '80's to help make pharmacy what it was today; alluding to Emilen Painter, James C. Steele, John Calvert, W. M. Searby, Professor Wenzell, and last but not least Dr. Herman Baer, all since departed, and that the speaker was the only one remaining of that aggregation.

Mr. Runyon further stated that the Association at that time honored him with the office of Local Secretary and if he recollected aright the local delegation raised a fund approximating \$6,000 to entertain the Association; and that he in company with Dr. Melvin, one of the druggists of Oakland, were delegated to make a trip to the northern part of the state and the Pacific Coast as far as Oregon to raise money with which to entertain the Association. It was his recollection that about \$1,500 was raised among the local druggists, and he was sure that anyone present at that time within the hearing of his voice would recall the very fine entertainment and great time accorded the visitors at the Palace Hotel in San Francisco, and said that Mr. Dawson was one of the valiant band, and the speaker felt that he was almost a stranger; and that but a few scattered ones remained of the old timers.

He thanked the Association for the opportunity of saying a few words and appearing before the Association on this occasion.

The President stated that in his estimation one of the happiest results and one which boded good for the future of the American Pharmaceutical Association, was the fact that the Association retained the loyalty and love of the men who worked so hard for the Association in its youth and in their youth; and who came before the Association in their mature years still indicating great loyalty to the it and its work.

The Chair called the attention of the session to the fact that it had with it delegates from the Association of Manufacturers of Medicinal Products, and called upon Dr. A. R. L. Dolime, of Baltimore, to extend the greetings on behalf of that organization.

Dr. Dolime stated that it afforded him great pleasure to convey to the Association the best wishes and a plea for hearty co-operation on behalf of the National Association of Manufacturers of Medicinal Products.

That many years ago, and in fact until comparatively recently, all the manufacturers of medicinal products felt that they were well taken care of at the hands of the American Pharmaceutical Association; that there was at that time no occasion for them to have an association of their own because the broad scope and

principles of the American Pharmaceutical Association gave them all the ideas to be desired, all that might be of interest and of importance to them, and to one another, and to the profession of pharmacy at large.

But that the advent of the Pure Food and Drugs Law and of the subsequent legislation in Nation and in State, which the speaker stated had become so very stringent and so very difficult and so very annoying to manufacturers in all lines, that the manufacturers felt that it was necessary for their own protection and for their own welfare to break away from the mother association to accomplish such specific work that might come before them in relation to legislation of various kinds, and that it was with a great deal of reluctance that they finally concluded to form an organization of their own and to have meetings of their own.

That the speaker did not wish to be understood by this that their love or their affiliation or their respect for the mother organization had by that action in any manner or degree been lessened; that the speaker thought that by that act the love and respect had been greatly increased because they realized the principles which underlie the organization of the American Pharmaceutical Association and which are so broad and catholic. The speaker really believed that every one of the members of the Association of Manufacturers of Medicinal Products regarded the Association with even more respect, caused them to appreciate even more than they did at that time, the great benefits and the great advantages to the profession at large that the American Pharmaceutical Association has produced during its very long and interesting career.

That he could only say that without exception this organization, since its beginning, meaning the Association of Manufacturers of Medicinal Products, had been a successful one; had been unanimous in all its actions; had been a success in accomplishing what it had set out to do; and the speaker said he believed that his association has reached, or nearly reached, a point in their relation with the legislation of the country, as a nation, which will make it difficult, or, rather more difficult than it was before, to have divergencies of opinion between legislative bodies and executive boards and between the manufacturer and the retailer.

That the speaker took great pleasure, in closing, in conveying hearty greetings and best wishes of the National Association of Manufacturers of Medicinal Products and hoped that the American Pharmaceutical Association would continue in its broad, big, noble career and continue to do the work, or even better work than it had done in the past. (Applause.)

President Mayo then assured Dr. Dohme that his listeners, as members of the American Pharmaceutical Association were delighted that the members of the National Association of Manufacturers of Medicinal Products looked upon the American Pharmaceutical Association as a mother organization, which, the President suggested he had reason to believe was one of the most valuable and potent influences, that of mother of associations. That it regarded itself the mother of the Association of National Manufacturers of Medicinal Products, the American Conference of Pharmaceutical Faculties and the National Boards of Pharmacy, which the President said had grown out of and was made up largely of the members of the American Pharmaceutical Association, each working in its particular field, and as the work went on giving especial attention to the particular phases affecting each organization.

The Chair then announced that there was in the hands of the Secretary a letter of greeting from the California Drug Clerks' Association and a telegraphic greeting from an absent member, Dr. George F. Payne. That the next order of business before the Association was the reading of the minutes of the Council, and the reading of the letter from Mr. Redington of the National Wholesale Druggists' Association, the results of whose work the American Pharmaceutical Association had seen during the time that Mr. Redington served on the local committee.

Thereupon the minutes of the Council were read by the Secretary of the Council; the minutes were approved *seriatim* by section; the Secretary of the Council also read the minutes of the sixth session, which were approved on motion by Mr. Nitardy, seconded by Mr. Newcomb.

The Secretary of the Council then stated that he desired to bring up again the question of the amendments which were presented at the first general session, which were read in full, freely discussed, and that as a matter of form, in accordance with the by-laws, expressed the opinion that they be adopted at that time or rejected; which on motion by Mr. England, seconded by Mr. Newcomb, motion carried, were declared adopted as read.

The Chair then called upon Mr. Weinstein, the Secretary of the House of Delegates, for a report of that body, in response to which Mr. Weinstein stated that he had no report, but that the Association might be desirous of hearing from the newly-elected chairman. Chairman Hyinson then stated that the Secretary had definitely requested of the general session on order of the branch at Denver that it authorize the incoming President to appoint a committee of five to investigate thoroughly the question of prescription pricing, the cost of material, the overhead charges and everything in connection therewith, the character of help required, and, in fine, everything in regard to prices of prescription and the possible percentage that should be added and reported at the next meeting; and therefore added that he desired to move that this recommendation or request of the House of Delegates be adopted by the general Association, which, upon second by Mr. Nitardy, carried, and was ordered done.

The Chair then requested Vice-President Charles Gietner to take the chair, as the President's modesty prohibited him from presiding under the painful circumstances about to be inaugurated, namely, the reading of the report of the Committee on the Address of the President.

Mr. Godding then presented the report as follows:

#### REPORT OF COMMITTEE ON PRESIDENT'S ADDRESS.

To the Members of the American Pharmaceutical Association:

We beg to report on the recommendations contained in the address of President Caswell A. Mayo delivered at the opening session of this convention as follows:

We heartily approve of recommendation No. 1 that all unnecessary ceremonial addresses and replies be eliminated from our proceedings as we believe that such procedure greatly aids in expediting the business of the convention.

We also approve of the second recommendation that the Committee on By-Laws be instructed to present for consideration provisions that the minutes of the Council shall not be read in the general session, but that the acts of the Council be outlined, and that on demand of any two members full information regarding such

action shall be presented to the general session, and that acts of Council shall be subject to review by the general session.

We also most heartily approve of recommendation No. 3 that the incoming President be instructed to appoint a committee of fifteen on the cultivation and collection of botanical drugs with an especial view toward the cultivation of indigenous drugs now going to waste.

In view of the fact that President Mayo elaborated a comprehensive scheme for work of such a committee we recommend that the incoming President will give due consideration to this work done by Mr. Mayo and appoint him as chairman of this committee, if such course will meet with his approval.

We further approve of recommendation No. 4 that the Committee on the Status of Pharmacists in the United States Government Service be instructed to draft and seek the passage by Congress of a bill providing for the creation of a corps of highly educated, expert pharmacists, whose duty shall be to direct the medical supply service of the United States Army and to continue their efforts to obtain higher pay and rank for the pharmacists now in the service.

We also approve recommendation No. 5 that a committee be appointed by the President to draft and present to Mr. Samuel W. Fairchild suitable resolutions of thanks for his generosity in having established an American scholarship of pharmacy.

We also most heartily approve of recommendation No. 6 that the General Secretary be instructed to lay the plan of associate members of the branches before the officers of the branches instructing them as to what steps should be taken by any branch desiring to provide for associate membership.

Respectfully submitted,

The Committee on President's Address.

(Signed) C. OSSEWARD, Chairman.  
W. H. COUSINS.  
JOHN G. GODDING.  
E. H. THIESING.  
F. W. NITARDY.

President Mayo then again resumed the chair.

Mr. Godding stated that there was a recommendation by the Committee on the Status of Pharmacists in the Government Service, which was covered by recommendation No. 4.

President Mayo then stated that the matter was open for discussion: Sergeant Hamner then asked for the privilege of addressing the convention, apologizing that it was the first time he had attended a meeting of the Association, and that he thought such a person should be seen but never heard, but that he desired to outline the conditions existing in the United States Army affecting pharmacists and men in the Hospital Corps, making a plea for the assistance of the Association in aiding the men in the army service, giving a lengthy history of the work previously done to secure better pay, and going into the qualifications, which he assured the Association were of a high character; the army service requiring of its men engaging in pharmacy work the passing of examinations at frequent intervals to test their knowledge.

The Chair then stated that he was very happy that Sergeant Hamner had misunderstood him, that is to say, the tenor of the President's suggestions as contained in the President's address, because it gave Sergeant Hamner an opportunity of stating on the floor what never had been stated before so succinctly and so thoroughly and so ably, the duties which were performed by the members of

the Hospital Corps. That the Chair did not lag behind anyone in his appreciation of Sergeant Hamner's able exposition of the subject, and thought there was a slight misapprehension with respect to the recommendation contained in the President's address; that the Association had tried to get the recommendation of the corps as now constituted and the President hoped the good work would continue. And added that he desired, with the permission of the chairman of the Committee to make a slight addition to the report of the chairman adding to the recommendations that the good work and results obtained be prosecuted further and that the Committee continue their efforts to obtain better pay and grade for the men now in service, and trusted that it would meet with Mr. Hamner's approval. That certainly the efforts of the Association on behalf of the men in the army service should be continued; that it was not antagonistic to the work of the Association, and it was the Chair's desire that the suggestion be added to the report and trusted it would meet with Mr. Hamner's approval, and stated it was certainly the intention of the Chair originally to have such a recommendation embodied in the report.

General Secretary Day stated he desired to add a word since he was chairman of the Committee on Status of Pharmacists in Government Service for two years, and during that time the Hughes-Bacon Bill, which the Secretary stated was the bill Mr. Hamner had reference to, was introduced.

The Secretary thought that the members of the committee who had intimate knowledge of the facts of the matter would agree with the General Secretary and concur in the statement that in order to work advantageously and get anywhere it was necessary to work in connection with the Surgeon-General of the Army and the Committee certainly tried to do that. The chairman of the committee to be appointed by the incoming president would immediately, or should immediately, and the General Secretary had no doubt he would, get in touch with the Surgeon-General of the Army. While it was the view of the General Secretary that the Surgeon-General could not initiate the bill, he could in an informal and unofficial, but very effective manner, assist its passage. Along the lines of the recommendations of the Surgeon-General to the Chief of Staff was the best chance for success.

The Secretary then submitted the following motion adopted at the joint session of American Conference of Pharmaceutical Faculties, National Association Boards of Pharmacy and Section on Education and Legislation, which was ordered referred to the general session for action.

That a committee of five be appointed by this Association, that said committee be authorized and empowered to submit to the A. M. A. a request for co-operation between the two bodies, by asking for the appointment of a similar committee, for the purpose of working along the lines suggested in the paper by Prof. J. P. Remington.

E. L. NEWCOMB,

Secretary Pro Tem., Joint Session.

Motion carried.

The Chair then stated that there was before the session for consideration the report of the Committee on Time and Place of Meeting.

The report of the committee was then read and is as follows:

REPORT OF COMMITTEE ON TIME AND PLACE OF MEETING.

The Committee appointed to report on time and place of meeting has received invitations from the following places: Galveston, Texas; Omaha, Nebraska; New York City, N. Y.; Atlantic City, New Jersey; New Orleans, Louisiana; Niagara Falls, N. Y.; and St. Louis, Missouri.

Your Committee recommend Atlantic City, New Jersey, as the place to hold the next meeting of this Association. The time to be fixed by the Council as in their judgment would be the best.

An urgent invitation has been received from the pharmacists of Maine, to hold the annual meeting in 1917 in Kineo. They are desirous of celebrating the fiftieth anniversary of the founding of the Maine Pharmaceutical Association.

In selecting Atlantic City, New Jersey, the Committee believed that the 1916 meeting should be held in a locality not visited for some years and in the section convenient to a large proportion of the membership. The hotel accommodations are ample and the other attractions of the resort appeal to the Committee in making its decision. It further feels that a large attendance will be secured with resulting increase in membership; and also that we are reasonably sure of cool and comfortable weather. Respectfully submitted.

The Committee on Time and Place of Meeting.

(Signed) JOSEPH P. REMINGTON, Chairman.  
OTTO F. CLAUS.  
PHILIP ASHER,  
F. W. NITARDY, Secretary.

Mr. Nitardy moved that the report be adopted, and the same being duly seconded and the motion carried, it was so ordered.

Secretary Day then stated that the resolution adopted on the request of the Joint Session for co-operation between the American Medical Association and the American Pharmaceutical Association, was the result of suggestions in the paper of Prof. J. P. Remington, entitled "Co-operation a Necessity, Why Should There Not Be Co-operation Between the Pharmaceutical and Medical Professions in This Direction?" carried with it the appointment of a committee. Mr. Freericks asked that the request be complied with and that the President be requested to appoint a committee, which on motion regularly made and duly seconded, and carried, it was so ordered.

The Chair announced that the next order of business would be the reading of the report of the Committee on Resolutions, and is as follows:

Your Committee on Resolutions reports that it has had but three subjects referred to it. One is the report of the Committee of the Council on the "representation in and the function of" this body. This, we recommend, should be read in connection with the report of your own committee on the same subject.

The other subject, "Prescription Writing by Physicians," to which our attention has been called by the Nashville Local Branch of this Association, is one in which the American Medical Association has already shown and taken great interest.

Your Committee advises that the objects of the resolution submitted by the Nashville Branch can best be advanced by the adoption of the following preamble and resolution:

WHEREAS, The members of the House of Delegates of the American Pharmaceutical Association view with pleasure and satisfaction the desirable and helpful effort now being made by the American Medical Association to generally improve

prescription writing by physicians through the more general teaching of the subject in medical colleges. Therefore, be it

*Resolved*, That the House of Delegates of the American Pharmaceutical Association heartily approves this campaign and requests the American Medical Association to continue its promotion until its objects have been accomplished.

Mr. Nitardy then moved that the resolution be adopted, and upon second by Mr. Newcomb, the motion was declared carried, and it was so ordered.

Mr. Freericks then said:

"Mr. President, it seems to me, that we, who have spent the last week in the city of San Francisco and State of California, have had, all of us, the most delightful week we have ever spent in our lives, and I think the California State Association and the San Francisco Local Association and the Local Committee are deserving of our appreciation for what they have done in the way of entertainment, not only to the membership proper but more particularly for the ladies we have had with us, and I do not know but what they were in a measure responsible for the very nice weather we have enjoyed, and I move you, Mr. President, that we extend to all these bodies our most hearty appreciation of thanks for their hospitality."

President Mayo then stated:

"It is with warm personal feeling that I rise to put this motion. I had thought myself that it was a wonderful country, a wonderful privilege to be here, a most wonderful city.

We come here and we find a city new and bright, keen, alert and going about their business with the spirit that knows no bounds, in a locality where only lately all was leveled with ashes and where only a few years ago there were Indians running over the plains.

I see that native sons rather sneer at the thought of there being Indians here at one time. You cannot remember that far back, but my father, as I told you before, rode out here on horseback from St. Louis to Sacramento, he followed the trail, and many a time he would go into the experiences of those adventurous days; and while he would not say very much to us boys about it, because he was afraid we would get the wanderlust and the desire to see strange countries and fight Indians and dig gold, he was not prone to embark upon the subject and dilate upon it very extensively, but once in a while when some old friend came to visit him they would sit up nights discussing and reminiscencing, many times until past midnight, and you couldn't get us boys to bed.

The Chair then asked the session to sing a verse of *My Country, 'Tis of Thee*, the assemblage standing; and responded to the sentiments put forth by "Our friend from Cincinnati," by saying that all would feel towards San Francisco and San Franciscans always great gratitude, and amid applause a standing unanimous vote of thanks was taken.

Chairman Thiesing of the Commercial Section then suggested that there were certain recommendations by the Commercial Section that he did not believe had been handed in in concrete form; that the first was to conserve to the retail pharmacists of the country the opportunity to manufacture U. S. P. and N. F. formulas; and that there had been several recommendations and that it was recommended that a committee of five be appointed to confer with the manufacturers or their accredited representatives to that end.

President Mayo then stated that it was his opinion that matters would be expedited by the taking up and acting upon of Chairman Thiesing's suggestion to the effect that the President of the Association appoint a committee of five to confer with the manufacturing houses with a view to conserving to the retail pharmacists the manufacture of U. S. P. and N. F. formulas; and upon the same being duly seconded, it was so ordered.

Chairman Thiesing of the Commercial Section then stated that the second recommendation was with regard to an effort to have an understanding with dispensing physicians, that a plan was outlined and that the recommendation was that a committee of five be placed in charge of the subject; that the outline was only a partial one but it took in testing this question out in two separate places, one in a fairly large city and one in a smaller-sized city.

Chairman Thiesing then read one paragraph of the outline to better acquaint the Association with its tenor. He elaborated by stating that it had been taken up and recommended to the committee of five, and that he would, therefore, move the approval of that recommendation and that a committee of five as recommended be appointed by the incoming President; the chairman believing that this was one of the most important things that had come to the general session from the Commercial Section, and that it offered an outline of activity that could be splendidly taken up by the American Medical Association and would be more likely to bring results than most any other effort, further stating that he thought that the effort be made by the parent body; that he also understood the recommendation was with a view of not antagonizing or causing any ill feeling, but was made with a view to creating a better understanding along educational lines, and he hoped the matter would find approval, and, therefore, made the motion.

The motion having been duly seconded by Mr. Osseward, the same was declared carried.

President Mayo then inquired whether there was any further business before the Association.

Dr. Anderson then stated that he had not heard any report from the Section on Education and Legislation, that they had made some very important recommendations, that they should be presented before the body.

Chairman Freericks stated that the officers were present, but that unfortunately, although the Chairman was not certain, the recommendations were submitted to another general session, and the Chairman felt sure there was one recommendation made and he believed submitted, namely, the subject matter of Professor Remington's paper, a committee of five to co-operate. He believed there was one other matter, which it was the Chairman's understanding had been submitted to an earlier session, having in mind the endorsement of the Stevens Bill, but that if it had not been submitted that perhaps there was a misunderstanding on the part of the section officers. That there was an understanding in regard to the Stevens Bill that the approval of the Section would stand in a measure as the approval of the general session; but that if that was not the understanding Chairman Freericks desired to urge as Chairman of the Section on Education and Legislation that it be approved.

The Chair then put the motion, the same was seconded, and it was so ordered.

Chairman Freericks stated that he felt rather guilty about the matter, that he desired to say that the work in reference to the Stevens Bill and its endorsement came before the joint meeting of the Commercial Section and the Section on Education and Legislation, and that it had been the understanding of the Chairman that the Secretary had presented the matter to the general session and that it had been acted upon. He desired to say in justification of himself and his position as Chairman of the Section on Education and Legislation that it would have been a matter of great regret to him and to all, and would have regarded it very wrong to have omitted it.

The chair then stated that in view of the apparently divided responsibility, and in view of the fact that there was no further business before the session the installation of officers would be the next order, and he desired to call on some ex-Presidents, namely, E. G. Eberle and Dr. Whelpley. Mr. Eberle stated that it afforded him great pleasure to carry out the instructions of the Association in introducing to them the President for the incoming year, Dr. William C. Alpers, of Cleveland, Ohio.

President Mayo said, during the course of the installation, that in laying down the cares of the office which had rested lightly upon him and of which he had been very proud, he invested the incoming President with the insignia of office. Not having used the gavel during his term, consequently did not hand it to the incoming President, and that it was not necessary in calling the meetings to order to hit the members over the head, because of their promptness and exceeding kindness. He would pin the badge upon the lapel of the incoming President and give him the assurance that he would find the members of the American Pharmaceutical Association a most loyal body of men and women; men and women who would co-operate with the President to the fullest extent in carrying out the work of the Association. That he was sure the Association would find in Dr. Alpers a most able, prompt, efficient and energetic servant; and that all knew because of Dr. Alpers' many past services to the Association it was only fitting to crown the achievements of the President's career, and that he be given the highest gift and honor that could come to an American pharmacist. That he felt in turning over the office to Dr. Alpers it was going to a most worthy successor of a brilliant line of worthy pharmacists.

The President felt that the affairs of the Association could be left in Dr. Alpers hands with confidence; that he would leave the Association better, broader and richer for his administration.

President Alpers, in responding, said:

Mr. President, Gentlemen of the Association: In accepting this highest honor within the gift of this Association I am more than ever aware of my shortcomings. In fact, I wished this morning that this hour would not come.

There are moments in every man's life when he feels, at least, in mine—that he is out of touch with his own work; that what he has done was wrong or was worthless or that he was misunderstood; and I had such moments this morning. I have them now, so if I speak to you I can do nothing else but tell you I feel in every instance, in all directions the shortcomings in my make-up, to preside over your body.

It is not that I undervalue, or underrate the high office; in fact, there is nothing that I could value higher than this honor. It is more gratifying to me because it comes to me in a year which is the twenty-fifth year of membership. (Applause.)

During these twenty-five years I have attended every meeting,—with a few exceptions—I have always taken active part in the transactions, in the debates, and many times stood in the midst of the fight.

I have always courageously stated my opinions; stated my reasons for or against this or that.

I know I have not always been right—no man is always right—but I have done my duty as a member of this Association wherever I saw it, irrespective of results. I feel that during these twenty-five years I have made some friends. I hope I have. I do not mean men who greet you with pleasant words and smiling faces but bear falsehood and malice in their hearts. I mean those who come to you with full and open heart, who when you meet them you think they tell the truth; men whose every word you believe; who when they say a thing you realize that they come forward hoping to enhance your own happiness, your own efforts and at the same time feel happy in these efforts.

During the twenty-five years, whatever I have done in the interest of pharmacy, whatever pharmacy may have profited by my work is but small compared with the profit I have derived from this Association. I do not know of any factor in my life, in my career that has interested me more, that has influenced me more for good than the attendance at these meetings.

I have always been an enthusiastic member. I will remain one to the end of my life, and when I recall the many excellent men with whom I have come in contact during this period I am almost ashamed and afraid to be called to this chair.

I recall men like Maisch, men like Curtman, men like Albert Ebert, who always were in the front of the fight, pitching in wherever they had a chance to do so, and such gentle and dear men as Prescott and Searby.

Then there was Thompson from Washington who wielded an enormous influence, who by a few words sometimes was able to turn the tide. I recall Dohme from Baltimore, Eliel from South Bend, and that excellent man, Charles Rice, who as pharmacist of the Bellevue Hospital in New York, where I lived was very close to me. I came in contact with him, perhaps, more intimately than others.

Now, gentlemen, when I think of these men and others whose names do not occur to me at the moment, think of the things they have done, think of the influence they have wielded for the good of pharmacy, I am ashamed.

I see them often now. Perhaps it is a peculiar gift to men like me afflicted with somewhat of a poetic nature to converse and counsel with men that others do not see. I can see them as I sit in my room alone in the darkness. Sometimes arising from the embers of the dying fire of the grate I have seen these men sitting around me. I have talked to them and heard their voices when I was in doubt about some things or when I wrote a paper on pharmaceutical matters, or wished to extract a strong opinion. I asked them, "What do you say?"

This mental communication is one of the greatest blessings derived from the men who went before us.

In religious circles we hear a great deal about immortality, that wonderful word that has a different meaning in almost every man's heart, and the conception of which is different in almost every man's mind.

To me, this mental reappearance of departed dear ones is immortality. They thus return to us, come forward to bring their thoughts, their ideas, their actions.

Let me add another thought: Let us all live, let us all shape our actions and our words here that we, too, may sometimes sit in that row; that some of the young men here whose names are little known now but who listen to the older

men, who have ideals perhaps nobler and greater, grander ideas; that when they grow old they may also call the circle around them and that we may step into that circle.

That is true immortality. Perhaps I speak in a more serious vein on this occasion than is fitting; perhaps I should speak in a lighter vein; but my heart prompts me, somehow or other, to say what I have said. I can tell you that whatever I have derived from pharmacy through this Association has been grander and nobler than anything else. It has given me inspiration. I have never left this convention, the meetings, without taking away something, something noble, something grand, be it the friendship of new members, be it the stimulation of new thought, some new idea, some work along a new line; so I say, let us work along this line; let us every one perceive that it is the true and noblest work of the pharmacist, and I pray all of you, every one of you to help me to carry out these ideals during the next year.

I ask you all to give me your advice wherever I need it. Call me down whenever you see I am wrong. I will gladly listen to you, and now let me express my hearty thanks and appreciation for this honor. I promise you that I shall do my very best in the interest and advancement of this Association and of our beloved profession. (Tremendous applause.)

President Mayo: The incoming President has a rare combination, a gift of words and a gift of action. We can all feel that the program which he has so adequately inaugurated in words will be carried out in activity.

The installation of General Secretary W. B. Day, Treasurer Whelpley, Editor Eberle, H. V. Army, member of the Council, was then proceeded with.

The Chair assured the session that it was with great pleasure that he placed before the Association the new officers and was quite sure that they would all serve the Association as faithfully in the future as in the past.

Mr. Freericks then arose and stated that he was really unfortunate in being compelled to rise again, but his excuse would have to be that there was a misunderstanding somewhat of the authority of the various sections as they relate to the general session. It appeared that there were a number of recommendations, brief ones, that were made by the Committee on Chairman's Address of the Section on Education and Legislation which should properly all come before the general session; and since Mr. Freericks believed they would only take a moment he asked that he be permitted to submit them, which was done; one having reference to the late regulation of the Internal Revenue Department under which prescriptions may not be refilled which contain a minimum quantity of opiates, which Mr. Freericks emphasized was a very important matter upon which the Association ought to go on record, principally in view of the fact that all were no doubt acquainted with its provisions. Mr. Freericks, therefore, moved that the following recommendation be adopted by the Association: That the Association go on record as protesting against the ruling of the Internal Revenue Commissioner under which it is held that physicians' prescriptions containing the minimum quantities of narcotics could not be refilled; the motion having a second, and the question being put, was declared carried.

Chairman Freericks of the Education and Legislation Committee then referred to the other recommendation which had reference to the stamp tax on toilet articles, it being generally understood that the revenue measure would likely be continued.

That the pharmacists of the country, particularly the retail pharmacists, would be called upon to unjustly defray a part of this added expense and tax, in the matter of having it apply to toilet articles, and stated that the Section on Education and Legislation recommended that the legislative committee of the Association be instructed to give these committees power to formulate opposition to the retention of that tax as it applied to toilet articles; and moved the adoption of that recommendation, which had a second and was carried. He further asserted that it would likely be a very serious matter and one that the executive committee could go into to formulate a change in the law, if it was re-enacted, to make it sure that the tax would be placed on the consumer; that that was done in the case of the Canadian War Tax; but that if the matter were referred to a committee, Mr. Freericks thought that action would be sufficient; that a burden would be imposed upon the pharmacists of the United States unless such a step were taken, and that it therefore seemed a very important matter.

On motion regularly made and duly seconded, the question put, it was so ordered.

The Chair then stated he desired to call attention to the fact that there would be a meeting of the Council immediately after the adjournment of this session in the same room; and that if there was no other business before the meeting, the Chair stated that it was with great regret, some pleasure and a little admixture of pride that he laid down his gavel. (Applause.)

Whereupon the Chair declared the sixty-third annual convention of the American Pharmaceutical Association adjourned.

## Editorial

E. G. EBERLE, Editor.....63 Clinton Building, Columbus, Ohio

### GREETING.

RETURNING from the recent meeting of the American Pharmaceutical Association to my home and daily work, I cannot but send a fraternal greeting from the fullness of my heart, to every member. Never before was I so proud of my profession, never before so thankful for my membership. Twice during the past summer I crossed the continent, starting from Cleveland, east to New York, from there west to the Golden Gate of the Pacific, and back by a different route to Cleveland. I saw unfurled before my eyes the immensity of our beautiful country, the richness of its golden fields of wheat and corn, the enchanting charm of its dark forests, the brilliancy and fragrance of its flowers; the gigantic majesty of its rocks and mountains, the impetuous torrents, and then the peaceful grandeur of its rivers; the terrific height and dazzling depth of its ravines and canyons; the solitude and barrenness of its deserts; the joyful life and wealth of its fertile fields. Many are the thoughts and feelings that rush to the traveller's mind, that grasp his soul, but out of their weird variety and multitude there are two that stand forth, strong and lasting,—the feelings of happiness and pride; the happiness of living in such a country, the pride of being one of its citizens. But the ardor of this pride and happiness was heightened by another benign and beautiful experience. Wherever I came, East or West, on the height of mountains or the monotonous level of the plains, in the crowded city or the lowly hamlet,—I found friends, pharmacists that extended to me the hand of fellowship and received me with warmth and sincerity. And to the pride of my country was added the pride of my profession, the happiness of being a member of the American Pharmaceutical Association.

What I had felt and known for years, I felt more deeply and earnestly than ever before,—that this Association is the truest source of inspiration for all that there is good in pharmacy, the very heart of American pharmaceutical life.

I wish I could impart this feeling to every member, fill his heart with the same happiness with which I return to my humble work, and imbue his soul with the same pride of pharmaceutical fellowship. But more than this. Happiness and pride are but empty thoughts if they stay dormant in our own hearts; to be real, they must come forth to action. They must help and strengthen the weak, encourage and fortify the timid, give speech and aggressiveness to the diffident, incite them all to fruitful action and make them spread blessing around them. Thus let it be with us. Let us go at our work with loyalty and devotion, with strength and determination. Let it be our aim to follow in the paths of many exalted men that have built up this Association; let our hearts be filled with the desire to add in some way, during the coming year, to this source of strength and inspiration. Let us use all our energy to help this Association according to our ability, be it by

collecting and distributing knowledge, be it by helping the weak or failing, be it by doing pioneer work for its further spread, be it by enlisting our neighbor to membership. Let us all work together faithfully and harmoniously, and do good of some kind,—good for ourselves, good for our fellow pharmacists, good for our Association and our beloved profession.

WILLIAM C. ALPERS.

## THE SAN FRANCISCO MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

**D**EMAND for the higher education of pharmacists with the view of establishing greater efficiency and better service; aspiration toward closer co-operation between related organizations that would increase their helpfulness for pharmacists, and the desire for knowledge of the true purposes of laws and regulations so that their effectiveness can be promoted in contributing dependable service and adequate protection of the public without needless and unwarranted restrictions, characterized the proceedings of the sixty-third annual convention of the American Pharmaceutical Association at San Francisco. There was evident interest and enthusiasm, notwithstanding the fact that most of those in attendance had come a great distance to see something of picturesque California as well as the wonderful Exposition, and participation in the work of the Association necessarily limited their time for such pleasure.

There was more or less difficulty in opening the sessions of the Sections on time, but this was largely due to a smaller general attendance than at the Detroit meeting. The accommodations at the latter convention were simply superb and such desirable provisions can be had only in comparatively few hotels; however, every assistance was given in San Francisco to facilitate the work of the Association. The daily papers gave little attention to the convention, ascribable to the many other events of more general interest to the public. The local committee did all in their power to make the visit of members enjoyable and the meeting successful; they were most generous in their hospitality. Every meeting has its lessons which may be applied in succeeding years and as co-operative spirit is a growing influence, we may refer to and deduct from the last three conventions.

The proceedings of no meeting of the American Pharmaceutical Association were ever better reported in the daily papers than at Nashville. The experience of this year suggests that especial attention be given this highly important matter in the future.

The Association was trained for greater efficiency in the conduct of the sessions at Detroit and the lesson should not be forgotten. That the Council did not conflict with the Section meetings in San Francisco is the outcome of last year's direction and the same idea should shape the program for next year.

A progressive thought of the San Francisco meeting was that which prompted the holding of the meetings of the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties several days before the convention week of the American Pharmaceutical Association. This enabled these bodies to expedite their business and afterward work together. Never

before has there been such enthusiastic co-operation, some even realized for the first time that these two great organizations were really co-workers—had the very same objects in view. Surely such a step will always be looked upon as progress and the program for next year should be prepared along similar lines, if possible.

The history of every meeting of the American Pharmaceutical Association records some notable event; the 1915 San Francisco meeting will be remembered by the establishment of the Fairchild American Pharmacy Scholarship. It also goes to prove that the co-operative work of the Association with the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties is recognized, for they have been jointly made custodians of the scholarship. It may be interesting to note that the Fairchild Scholarship of Great Britain was this year awarded to Miss Doris Gregory now employed at Buchanan, Limited, London.

The sixty-fourth annual meeting of the American Pharmaceutical Association will be held at Atlantic City in September, 1916. It is not too early to begin to plan for making this meeting a most successful one.

E. G. EBERLE.

#### CO-OPERATION BETWEEN THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY AND THE AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES.

**D**URING the past year, and at the convention in San Francisco, The National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties have come to a better understanding of their respective functions.

Boards of Pharmacy base their judgment of the candidate's fitness to practice pharmacy largely upon the answers given by them to questions propounded by the examiners. Admittedly this is an imperfect test, but the numerous classified questions sent in to a special committee, appointed jointly by the organizations referred to, most forcefully indicates a very wide diversity of opinions relative to proper examination questions and impresses the necessity of co-operation between those who teach pharmacy and those who pass judgment upon their students. This is not a new discovery but corroborates a fact well known, and a condition which has evoked criticism from both, that to some extent has estranged the members of boards of pharmacy and teachers in pharmacy schools.

These bodies met together and discussed the subject with the evidence before them and recognized that after all both had the same object—that of qualifying pharmacists. The result is that these questions, and others to be presented, will be systematically arranged and grouped, so that when used as a guide, they will supply tests that, to say the least, come nearer in affording a correct determination of the fitness of the candidates than ever before possible.

The National Wholesale Druggists' Association, through Chairman W. A. Hoyer, asked the several bodies represented in convention at San Francisco to discuss the subjects of reducing the number of those engaged in the drug business without sufficient financial resources and discourage prescription departments in

stores where revenue was dependent upon the sale of merchandise and wherein the former was either inefficiently conducted or unprofitable.

There is no question but that the present system of licensure equalizes the standards of those who enter the drug business and still we realize the inequalities of those engaged. Are the standards fixed according to public opinion or the consensus of the opinion of pharmacists?

In the United States we insist on individual liberty and it is therefore with great difficulty that professional standards are advanced, so we must use the means at our command. The differences of opinion between the two organizations result from the viewpoints of the individuals, one class judging from conditions as they interpret them, the other as they would have them; both desire progress of pharmacy, hence there should be no great difficulty in the adjustment of opinions.

Public opinion cannot and must not be ignored: If the boards are, beyond question of legal complication, agencies for the fixing and enforcing of both professional and academic educational requirements for admission to the practice of pharmacy, then the direction of affairs is with them and they are largely responsible for the progress of pharmacy. Thereafter, the responsibility would be with the pharmacists in selecting members for boards of pharmacy to carry out proper policies.

We must have a thorough knowledge of the general conditions of the drug business, we must comprehend what we are desirous of doing, and know whether public opinion will sustain us, before effectual and progressive work for pharmacy can be accomplished.

In our estimation, the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties are destined to become potential factors in the future progress of Pharmacy in this country.

E. G. EBERLE.

## WILLIAM CHARLES ALPERS,

President of the American Pharmaceutical Association.

William Charles Alpers, Sc. D., President of the American Pharmaceutical Association, was born at Hanover, Germany, July 7, 1851. He attended the High School (Gymnasium) in Hanover, then the School of Technology, and later the University of Goettingen, where he studied in Natural Sciences and Mathematics. His studies were interrupted in 1870 by the Franco-German war, in which he participated. After the war, he came to America and was engaged in teaching for nearly ten years in the St. Matthew's Academy, New York. He entered the New York College of Pharmacy, and later took a post-graduate course in chemistry at the University of New York, receiving the degree of Sc. D. in Chemistry. In 1881 he opened a pharmacy in Bayonne, N. J., where he remained until 1898.

After leaving Bayonne, N. J., Dr. Alpers was for a number of years, manager of The Merck Pharmacy in New York and afterwards conducted The Alpers Pharmacy on Broadway and 31st Streets. This pharmacy, located in the center of the hotel district of New York, was considered the most elegant pharmacy of the city and soon attained a deserved reputation for efficiency, correctness and prompt service. Dr. Alpers withdrew from active business in 1905.

From the very first day of his pharmaceutical career, Dr. Alpers exhibited great interest in the development of pharmacy, and became active in the State as well as the National Association. He was elected President of the New Jersey State Pharmaceutical Society in 1896, and served as a member of the New Jersey State Board of Pharmacy from 1893 to 1898. In 1890 he became a member of the American Pharmaceutical Association and attended his first meeting in 1892 at the Profile House. Since that time he has seldom missed a meeting and has been very active in its deliberations. He has contributed a number of papers and is always found in the foremost ranks, contending for the betterment and advancement of the profession. He was chairman of the Scientific Section in 1896, of the Section on Pharmacy and Dispensing in 1906, and of the Historical Section in 1913. In 1903 he was elected First Vice-President and this year occupies the highest office of the Association.

He is a member of the Executive Committee of the Revision of the Pharmacopœia, and Chairman of the Sub-Committee on Syrups and Elixirs. He was a trustee of the New York College of Pharmacy for three terms until his removal to Cleveland to become Professor of Pharmacy and Dean of the Cleveland School of Pharmacy, in 1914; Dr. Alpers has contributed for many years to pharmaceutical and chemical literature and is now editor of the *Apotheker-Zeitung*, New York. He is the author of many pamphlets and of two books, "The Medicinal Plants of Staten Island," and "The Pharmacists at Work." (Lippincott, 1896).

Among Dr. Alpers' most notable contributions to pharmaceutical literature is his History of the American Pharmaceutical Association, the first decade of which was published in the Journal of 1912, and the second decade in the Journal of 1914.

Dr. Alpers has been married twice, first to Miss Bertha Guden, by whom he had six children. His oldest and youngest sons, William H. and Otto, received their pharmaceutical education in the New York College of Pharmacy. In 1913 Dr. Alpers espoused the present Madam Alpers, nee Miss Mathilda Van Damm.

In 1914 Dr. Alpers conducted the memorable excursion of American Pharmacists through Germany, Austria and Switzerland, which was cut short by the European war, that prevented the party from visiting Paris, as was also intended. Dr. Alpers and his party were everywhere received with the greatest enthusiasm. The leading pharmacists of Europe who knew him through his writings, welcomed him everywhere and willingly opened to him and his friends the doors of all pharmaceutical institutions.

ABSTRACT FROM THE REPORT OF THE PROCEEDINGS OF THE  
NATIONAL ASSOCIATION OF BOARDS OF PHARMACY, HELD  
IN SAN FRANCISCO, CALIFORNIA, AUGUST 5 AND 6, 1915.

The twelfth annual convention of the National Association of Boards of Pharmacy was called to order at 11:25 on Thursday morning, August 5, at the Ramona Hotel, San Francisco, by the President, T. A. Miller, of Richmond. President Miller said that the usual addresses of welcome would be dispensed with, and requested the Secretary, H. C. Christensen, of Illinois, to call the roll.

After the roll call the Secretary announced that nineteen delegates were present representing thirteen different states out of the twenty-three states from which credentials had been received.

President Miller appointed the following members as a Committee on Credentials: Dr. George C. Diekman, New York; A. C. Wilson, Iowa, and Alfred Walker, West Virginia.

On motion of Mr. Wilson, of Iowa, the presentation of the annual address of the President and other officers was deferred to the afternoon session on account of the small attendance and the expectation that a larger number would arrive. After which the session was adjourned until 2 o'clock.

SECOND SESSION, THURSDAY AFTERNOON.

The second session of the Association was called to order by President Miller. Secretary Christensen called the roll, showing that the same delegates were present that had been present in the morning. The President requested J. C. Burton, of Oklahoma, Chairman of the Executive Committee, to take the chair, and then proceeded to read his address.

In this address the President briefly reviewed the history of the past year, telling of the work which had been performed by the Executive Committee and the officers of the Association. He referred with deep sorrow to the death of Fred A. Hubbard, of Massachusetts, President of the Association in the years 1907-8, and of Dr. Thomas F. Raymow, member of the Board of the State of New York. The President recommended that a memorial page be set aside in the minute book of the Association to record the death of each member who may have died during the year; that steps be taken to help relieve the pharmacists of Belgium in accordance with a request which had been transmitted through the Secretary; that high school education or its equivalent and graduation from a recognized school of Pharmacy be required of all candidates for registration in pharmacy after the year 1920; that the Commissioner of Internal Revenue be requested to require physicians, druggists and veterinary surgeons to keep copies of all prescriptions written by them in which narcotic drugs were ordered.

On motion of John Culley, of Utah, the address was referred to a committee for consideration of its recommendations. Chairman Burton appointed John Culley, Utah; J. W. Gayle, Kentucky, and Walter H. Cousins, Texas, as a Committee on the President's Address.

President Miller resumed the chair and called for the report of the Treasurer, which was submitted by the Secretary, Mr. Christensen, in the absence of the

Treasurer, F. W. Ward, Tennessee. This report was presented in summary and action deferred to a later session.

A. C. Wilson, Iowa, submitted a resolution providing an amendment to Article VII of the By-Laws, eliminating the word "active" from the present By-Laws, and substituting the word "five" for the word "three." The adoption of the resolution was moved by Mr. Wilson and seconded by Thomas D. Gregg, Illinois. The motion, after prolonged discussion, was put to vote and defeated.

President Miller then appointed the following members as a Nominating Committee, with instructions to present nominees for the several offices of the Association at the afternoon session on Friday: Thomas D. Gregg, Illinois; A. C. Wilson, Iowa, and W. H. Cousins, Texas.

J. C. Burton, Oklahoma, presented the report of the Executive Committee as chairman, covering the activities of the committee since the Detroit meeting. A meeting of the full committee had been held in Washington on March 16, 17, 18 and 19, 1915, at which all of the officers were present. The committee discussed plans for the program at the San Francisco meeting, selected a reporter to report the proceedings and adopted a resolution requiring applications for registering by reciprocity to be made on the official application blank of the Association. The committee discussed at length the statistics which had been kept by the various boards and their relation to the matter of reciprocal licensure. The committee recommended that the boards should not exclude from licensure applicants who had been unable to furnish detailed evidence or certification of grades made in examination. A form of proviso was adopted covering the cases of persons registered without examinations. The operation of the Harrison Anti-narcotic law was discussed at a conference with the authorities charged with its enforcement. A joint meeting with the Chairman of the Committee of the American Conference of Pharmaceutical Faculties was held, at which the program of the Detroit meeting was adopted. The work of the Advisory Committee was discussed with representatives from the faculties. The Secretary was instructed to obtain the fullest possible details regarding the examinations held by the different boards, with a view to putting a license by reciprocity on a more practicable scale. During the year 318 applications had been received and reciprocal registrations granted.

The report was referred to the following committee for consideration: H. L. Meredith, Maryland; W. F. Root, Vermont; Charles Gietner, Missouri.

J. W. Gayle, Kentucky, as Chairman, presented the report of the Committee on Legislation, which was signed by himself, Burton Cassiday, Indiana, and B. S. Persons, Georgia. The report directed attention to a number of recommendations contained in the report of the committee presented last year at Detroit. The committee recommended that a special committee be appointed to present these recommendations to the Section on Education and Legislation of the American Pharmaceutical Association, with the request that they be incorporated in the Model Pharmacy law. A number of additional recommendations were also made and these recommendations were referred to a committee composed of: R. A. Doyle, Missouri; Dr. George C. Dickman, New York, and Alfred Walker, West Virginia.

President Miller announced that the session was open for general discussion.

and said that it would be in order to take up the report of the Executive Committee if this was desired. On motion of Mr. Gietner, seconded by Dr. Diekman, the report of that committee was taken up seriatim. At the request of the President, Chairman Burton of the Executive Committee read the recommendations which were acted on as follows: The committee recommended the appointment of a committee of three to confer with the A. Ph. A., with a view to selecting central locations for places of meeting. This was adopted. That the official application blank of the N. A. B. P. be used by all applicants for reciprocal registration; this was adopted. That in those states where incomplete statistics had been kept, "the requirement of not less than 60 percent in any subject" might be waived where the secretary of the board certifies that the action is up to the N. A. B. P. standard. That the state board be allowed to grant reciprocal registration to applicants who had had fifteen years' experience subsequent to registration by reason of having been engaged in business at the time the state law was enacted, provided that he satisfies the board as to his qualifications by oral examination. That the official application blank be amended so as to provide that the applicant shall comply with such other rules and regulations as "this board may have established in regard to reciprocal registration." The suggestion that arrangements be made for the interchange of assistant's certificates was discussed by Messrs. Gayle, Root, Diekman, Walker, and was finally rejected.

There being no further business before the session, adjournment was had at 5 p. m.

#### THIRD SESSION, FRIDAY MORNING.

At the opening of the Third Session on Friday morning, Secretary Christensen read a telegram from R. H. Walker, Gonzales, Texas, explaining, apologizing for and regretting his absence, and was instructed to make suitable reply.

John Culley, Utah, as Chairman of the Committee on the President's Address, recommended the adoption by the Association of the following recommendations of the President: That a memorial page be set aside to record the death of members of the Association. That a high school education or its equivalent and the graduation from a recognized school of Pharmacy be made a prerequisite for candidates for registration after 1920; that the Commissioner of Internal Revenue be requested to require physicians, dentists and veterinarians to keep copies of all prescriptions calling for narcotic drugs. The request for aid for the pharmacists of Belgium was referred to individual members for individual action as the associations had no funds available for such purpose. The prerequisite requirement recommendation precipitated an animated discussion participated in by Messrs. Walker, Gietner, Wilson, Haymaker, Meredith, Root, Christensen, Cousins and Miller. The recommendation of the committee as a whole was adopted.

The report of the Committee on Legislation was taken up for discussion and the following recommendations were adopted: (1) That a committee of three be instructed to bring before the Section on Education and Legislation of the American Pharmaceutical Association the nine recommendations adopted at the Detroit meeting, with a request that they be incorporated in the Model Pharmacy Law. (2) That uniform label requirement be adopted by all Boards. (3) That

uniform requirements be adopted with respect to display of certificates of registration. (4) That all state laws be made uniform and to conform with the United States laws concerning narcotic drugs. (5) That the term "patent or proprietary preparation or remedy be defined as one, the name of which does not appear in the United States Pharmacopœia or National Formulary or the complete formula of which is not printed on the label attached to the container."

On motion of Dr. Dickman the recommendations regarding legislation were referred to the Section on Education and Legislation of the American Pharmaceutical Association.

President Miller called for a report from the individual members regarding the working of the Harrison anti-narcotic law in the different states. W. H. Cousins reported that save for a temporary congestion of the municipal hospitals at first the law had been a success in Texas. Dr. Dickman reported a satisfactory effect of the law in New York State. J. W. Gayle said that the law operated satisfactorily in Kentucky except that the state did not define a veterinarian and, as a consequence, unqualified men, claiming to be veterinarians, had abused the privilege extended to this class. A. C. Wilson said that the pharmacists were pleased with the operation of the law in Iowa. John Culley said that Utah pharmacists looked upon the Harrison law as one of the most salutary and beneficent pieces of legislation enacted in recent years. E. F. Boden said that the pharmacists of Michigan were much pleased with the Harrison law and had secured an amendment of the state law to make it conform exactly with the National Act. J. C. Burton said that the law works nicely in Oklahoma. J. W. Gayle, of Kentucky, and President Miller both spoke of the failure to prescribe any restrictions in the issuance of prescription blanks and order blanks.

Secretary H. C. Christensen called the attention of the Association to a request for aid of Belgian pharmacists. While the members sympathized deeply with the object sought, it was ruled that the funds of the Association could not be diverted to such eleemosynary purposes, but the individual members were invited to forward subscriptions.

The following former members of Boards of Pharmacy were elected to honorary membership: Walter C. Price, West Virginia; D. F. Davis, Vermont; John J. Campbell, Michigan; Will E. Collins, Michigan; J. B. Mitchells, Illinois; Charles A. Fraser and J. D. Humphrey, Oklahoma; M. C. Metzger, Illinois; C. E. Zinn, Missouri; John R. Wall, New York; C. S. Porter, Kentucky; John R. Crittendon and Tom J. Snell, Texas; William S. Flint, Massachusetts.

The meeting then adjourned to 2 o'clock.

#### FOURTH SESSION, FRIDAY AFTERNOON.

At the opening of the Fourth Session on Friday afternoon, Secretary Christensen read the report of the Advisory Committee, which was adopted as read. Secretary Christensen explained some of the special phases of the recommendations of the committee which were discussed by Messrs. Gayle, Walker, Meredith, Root, Dickman.

Mr. Culley directed particular attention to the importance of the joint meeting to be held on Saturday morning with the Conference of Faculties, and urged the

attendance of all the members. A resolution was adopted providing for the appointment of a committee to raise funds to pay the expenses involved in a continuation of the work of the Advisory Committee. This committee of three will be known as a Committee on Ways and Means and will be appointed by the incoming President.

Thomas D. Gregg, of Illinois, read the report of the Committee on "More Satisfactory Examination of Candidates for Graduation and for Board Certificates," by W. S. Flint, Chairman, of Massachusetts. On motion of Mr. Gietner this report was adopted.

The Boards of the District of Columbia and the State of Oregon were elected to membership.

H. C. Christensen presented his report as Secretary, in abstract, which was accepted and referred to the Executive Committee.

The Secretary read several letters from various Boards, which were filed as a matter of record.

W. H. Cousins read the report of the Nominating Committee recommending the election of the following officers: President J. C. Burton, Oklahoma; First Vice-President, J. W. Gayle, Kentucky; Second Vice-President, W. F. Root, Vermont; Third Vice-President, John A. Weeks; and Secretary and Chairman of the Advisory Committee, H. C. Christensen, Illinois; Member of Executive Committee, A. C. Wilson, Iowa; Member of the Advisory Committee, Charles Gietner, Missouri; Treasurer, F. W. Ward, Tennessee; Syllabus Committee, E. E. Faulkner, Michigan. The entire list were elected in accordance with the report of the committee.

The installation of officers then took place and the session was adjourned.

In succeeding issues of the Journal some of the reports of officers and committees will be printed.

---

#### AN ABSTRACT OF THE MEETING OF THE AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES HELD IN SAN FRANCISCO, CALIF., AUGUST 6.

At the Sixteenth Annual Meeting of the American Conference of Pharmaceutical Faculties, held in the City of San Francisco on August 6, 1915, action of special interest to the Colleges and Faculties was taken as follows:

Several recommendations contained in a report made by Dr. H. H. Rusby, of New York, as chairman of a special committee created at Detroit last year to investigate and report upon the question of teachers' salaries, were made, viz.:

1. That it is neither practical nor desirable to advise that the Conference make any schedule of salaries, either minimum or maximum, at the present time.
2. That the Dean should receive a salary for that office aside from and in addition to what he may receive for his teaching position.
3. (a) That the salary of an Associate Professor shall be two-thirds that of a Professor.  
(b) That the salary of an Assistant Professor shall be four-fifths that of an Associate Professor.

(c) That the salary of an Instructor shall be three-fourths that of an Assistant Professor.

(d) That the salary of an Assistant shall be half that of an Instructor.

(e) That each of these salaries be fixed on an advancing scale, from a minimum to a maximum, and that the minimum for one grade be equal to the maximum of the grade next lower, three years being required for the maximum to be attained; and that the salary should pertain to the position, and not the man.

The last clause (e) of the third recommendation was amended to the effect that an increase of salary shall go with every promotion in rank, without having to wait for a year for such increase.

The recommendations as thus amended were then adopted as the recommendations of the Conference.

The question submitted to a special committee last year as to whether the regular two-years' college-of-pharmacy course should be extended to three years in 1920 was reported upon adversely as not warranted by present conditions in a report submitted by Chairman H. M. Whelpley, of St. Louis.

The Conference adopted a motion to refer to the Secretary and Executive Committee, with power to act after conference with the Publication Committee of the A. Ph. A., a proposition made to consider the publication of the proceedings of the Conference in the *Journal of the American Pharmaceutical Association*.

The address of the President embodied a great many valuable suggestions and recommendations, and the unusual course of referring same to two committees instead of one,—a committee upon the outward relations of the Conference, as set forth in the first division of the address, and a committee upon its inner relations, considered in the second division,—was adopted, with the result that the Conference adopted the following recommendations coming from the two committees, the first two only being proposed by the first-division committee:

1. That a Standing Committee on Higher Educational Standards be appointed by the President of the Conference, to work jointly with similar committees of the A. Ph. A., N. A. B. P., N. A. R. D., and State Associations, such committees to work with their parent associations as well as jointly.

2. That a Special Committee on the Federation of all Pharmaceutical Organizations be appointed.

3. That a committee of three shall be appointed to consider the propriety of establishing a secondary class of membership in this Conference, said committee to report at the next annual meeting.

4. That the traveling expenses of the Chairman of the Executive Committee, including the expense of attending the annual meeting of the Conference, be paid, and that he be considered the officer to fulfill the duties suggested by the President in his address.

5. That the attention of the Secretary of the Conference be called to the suggestion of the President that the time has come for greater publicity of the work of the Conference, through the papers where the meetings are held and through the pharmaceutical press.

6. That the Rules and Regulations of the Conference be revised to date each year, and published in the *Annual Proceedings*.

7. That a special committee be appointed to consider and report next year upon the suggestion made by the President that this organization become an Association of Colleges and Faculties of Pharmacy.

8. That the suggestion of the President is approved, that the members of this Conference be apprised of the possibility or probability of a Carnegie investigation in the near future, and that it is desirable that the Secretary of the Conference call the attention of the schools to this prospect.

9. That, without discussion or hesitation, the Committee on President's Address unanimously recommends the Sabbatical year.

10. That the committee approves the recommendation of the President that the statistics on secondary education now in the hands of the Chairman of the Executive Committee be tabulated and presented at the next annual meeting.

11. That the committee approves the recommendation that the Executive Committee investigate the conditions of the Carnegie retirement allowances, and ascertain if the members of this Conference can be included.

12. That the committee approves the recommendation regarding the appointment and promotion of faculty members.

13. That the committee approves the recommendation regarding the exchange of professors among the schools.

14. That a committee of three be appointed on the classification of Teaching Staffs.

15. That a committee of three be appointed on the question of matriculation blanks, advanced standings for students, and other similar subjects discussed by the President.

16. That a committee of three be appointed on the Relations and Duties of Alumni.

17. That a committee of three be appointed on Relations with other than Pharmaceutical Schools.

18. That a committee of three be appointed on Conference with Boards of Pharmacy.

19. That a committee of three on College Bulletins be appointed.

The following recommendations made by the Chairman of the Executive Committee in his report were adopted:

1. That the Executive Committee be instructed to arrange in future for the annual meetings of the Conference immediately preceding the meeting of the American Pharmaceutical Association.

2. That the Conference recommends that the minimum requirement for the degree of Doctor of Pharmacy shall be at least a four years' College-of-Pharmacy course, following sixty counts of secondary education.

A resolution was adopted requesting the National Association of Boards of Pharmacy to rescind its action heretofore taken not to meet annually in advance of the A. Ph. A. meeting and agree to meet immediately prior to that time, so that the Conference and Boards may have their annual meetings at the same time.

A motion was adopted that the Secretary, in sending out to the schools prompt notice of the action taken by the Conference in annual meeting upon matters affecting their interest, in accordance with the resolution adopted last year, be directed to request the schools to notify him of any action taken by them upon the various subjects recommended by the Conference.

A hearty rising vote of thanks was extended retiring President Wulling for his very able and comprehensive address, and for the ability and fairness with which he had conducted his office.

## A SYNOPSIS OF PRESIDENT WULLING'S ADDRESS.

## PART I—THE CONFERENCE AND ITS OUTWARD RELATIONS.

1. A diagnosis.
2. The Conference and the N. A. B. P. and the State Boards.
3. The Conference and the Colleges.
4. The Conference and the State Associations.
5. The Conference and other Associations.

## PART II—THE CONFERENCE AND ITS INNER RELATIONS.

I. *The Conference Itself.*

1. Administration Affairs.
  - a. Increasing the membership.
  - b. An additional class of membership.
  - c. Greater Conference activity.
  - d. Increase of annual dues.
  - e. Employment of the Conference income.
  - f. Salaried officers.
  - g. Greater publicity.
  - h. Manual of Conference rules and actions.
  - i. Nomination of officers.
2. The Conference and the Colleges.
  - a. A conference or an association?
  - b. Carnegie Foundation investigation.
  - c. Sabbatical years.
  - d. Tabulated information on secondary education.

II. *The Colleges.*

1. The Colleges and Their Administrative Affairs.
  - a. The college governing bodies.
  - b. The budget.
  - c. The teaching body.
  - d. Appointments, promotions, salaries.
  - e. Exchange professors.
  - f. Special lecturers.
2. About the Faculties.
  - a. Classification of teaching staff.
  - b. Qualifications of teachers.
  - c. Ratio of teachers to students.
  - d. Faculty regulations of student activities.
  - e. Research.
  - f. Fellowships.

## 3. About the Students.

- a. Uniform methods of registration.
- b. Uniform systems of grading.
- c. Uniform rules governing advanced standing.
- d. Proper student activities.
- e. Ethical standards, housing and health conditions.
- f. Student councils.
- g. Honor system.
- h. Scholarships.
- i. Loan funds for worthy students.

## 4. About the Curriculum.

- a. Relative and equitable percentage value of courses comprising the curriculum.
- b. Credits value of subcourses.
- c. Business and law subcourses.
- d. Book research, journal work, courses of reading and cultivation of medicinal plants as parts of regular curriculum.
- e. Subcourse prerequisites.

## 5. About the Alumni.

- a. Maintenance of alumni interest.
- b. What alumni should do for the college.
- c. Alumni on the Boards.

## 6. About Relations with Colleges other than Pharmacy.

- a. Pharmaceutical credits towards advanced standing in medical and dental colleges.
- b. High schools as feeders for the colleges.

## 7. About Relations with the Boards.

- a. Boards and entrance standards.
- b. Co-operation between Faculties and Boards in examination of candidates.

## c. Outline of examinations

## 8. About College Bulletins.

- a. Model bulletin.
- b. Uniform credit units.
- c. Courses stated in credit units.
- d. Statement of membership in Conference bulletins.

It is contemplated to print reports and papers presented at the Conference in succeeding issues of the Journal.

## Contributed and Selected

### ACTINOMYCES MYRICARUM (YOUNGKEN), THE CAUSE OF MYRICA AND COMPTONIA TUBERCLES.\*

HEBER W. YOUNGKEN, PH. G., A. M., PH. D.

Within the past thirty years various investigations have been carried on by Brunchorst, Moller, Shibata, Chevalier, Harshberger, and Arzberger in respect to an endophytic organism living in the tissues of the *Myricas* and forming tubercles.

Brunchorst<sup>13</sup> was the first to mention the tubercles on *Myrica Gale* and named the fungus producing them—*Frankia Subtilis*—because he considered this organism similar to that in the tubercles of *Alnus*.

Moller<sup>14</sup> later found the organism to differ considerably from that infesting *Alnus*, and named it—*Frankia Brunchorstii*.

Shibata<sup>15</sup> investigated the tubercles found on *Myrica rubra*, his observations being on both fresh and preserved material. He described the morphology of the tubercle, showing that the fungus confines itself to a ring of from one to three layers of cells beneath the cork, thus differing from the condition found in *Alnus*. He also pointed out that infection takes place acropetally by means of fungal threads. He traced these threads into the already differentiated meristomatic cells where they grew rapidly to form a dense thready reticulum, then branched into radiate threads whose free ends became swollen in clavate fashion. He assigned to the fungus a position in the genus *Actinomyces*.

Chevalier<sup>7</sup> (p. 124-139) examined the tubercles on the roots of *Myrica Gale* (*Gale pabustris*), *Myrica cerifera*, *Myrica Caroliniensis* (*M. Pennsylvanica*), and *Myrica sapida* var. *longifolia*. He found them on main roots, adventitious roots of subterranean branches, and on subterranean stems. He described at length their general gross structure and histology, the occurrence of gummy lignin in the cells attacked, and called the infesting organism, *Frankia Brunchorstii*, previously observed by Moller.

Harshberger<sup>16</sup> observed the tubercles on the adventitious roots of *Myrica cerifera*. He studied the structure of the mature tubercles from dry material only which had been boiled in water and afterwards treated with alcohol. He called the tubercles *mycodomatia* and claimed for the infesting fungus a position closely related to the *Comycetes*.

Arzberger<sup>17</sup> investigated the root tubercles of *Myrica cerifera*, *Myrica Gale*, and *Comptonia asplenifolia* (*Myrica asplenifolia*) and stated, like Harshberger,

\* Abstract from *The Comparative Morphology, Taxonomy, and Distribution of the Myricaceae of the Eastern United States*, a thesis presented to the faculty of the Graduate School, U. of P., May, 1915, by the author in partial fulfillment of the requirements for the degree of Doctor of Philosophy.

that these structures appear on adventitious roots which grow out from the lower part of the stem or from branches or stems which have been covered over with leaf mold or soil for several years. He described the morphology and cytology of the tubercles, but his illustrations do not show the true nature of the radiating clavate branches. He favored the opinion of Shibata in placing the fungus in the genus *Actinomyces*.

During the last three years the writer has collected and examined abundant tubercle material of *M. cerifera*, *M. Caroliniensis*, *M. Macfarlanei* (*M. cerifera* and *M. Caroliniensis*) Youngken, and *Comptonia asplenifolia* at Palermo and Tuckahoe, N. J.; of *M. Caroliniensis* and *Comptonia asplenifolia* at Clementon and Albion, N. J.; of *Comptonia asplenifolia* near Mainville, Pa.; and of *M. cerifera*, *M. Caroliniensis*, and *M. Macfarlanei* at Wildwood and Rio Grande, N. J. He has raised *M. cerifera* seedlings bearing tubercles from seeds which he planted in sandy soil in the University of Pennsylvania greenhouse. He has furthermore examined tubercle material of *M. Gale* collected by Dr. John M. Macfarlane along Trefethan Bay in Chebeague Island, of Casco Bay, and on the south eastern part of Peak's Island in Casco Bay, Maine.

#### METHODS.

Material from many plants of each species was macroscopically and microscopically examined both in its fresh and preserved condition. All of the preserved material was fixed in weak, medium, and strong Flemming's on the ground immediately after the position and nature of the tubercles on the plants had been ascertained. Samples of each lot were then dehydrated in gradually increasing strengths of alcohol, cleared in cedar oil and xylol and imbedded in paraffine. Transverse, tangential, longitudinal radial, and longitudinal tangential sections were then cut 6-10 microns thick and subsequently stained in several ways. The best results were obtained with the Methylene Blue and Acid Fuchsin combination, although satisfactory results were also obtained with a combination of Saffranin and Gentian Violet.

The writer employed the following technique in isolating the endophyte which produces the tubercles on *M. cerifera*, *M. Caroliniensis*, *M. Macfarlanei*, *M. Gale*, *Comptonia asplenifolia* and probably most, if not all, of these lesions on other plants of the *Myricaceae*.

A tubercle cluster from a root of one of the seedlings grown in the University of Pennsylvania Greenhouse was washed thoroughly with clean water to remove all traces of adhering soil. It was then introduced into a test tube containing 1:1000 corrosive sublimate solution for twenty seconds in order to destroy any surface organisms. From this it was transferred with sterile forceps to a test tube containing distilled water which had previously been sterilized in the autoclave. Into this was introduced a sterile scalpel and two of the tubercles were cut into small fragments. These fragments were next transferred to five tubes of sterile slant agar by means of a sterile platinum loop. The tubes containing the culture were then stored in a dark closet at ordinary room temperature for several weeks. All five cultures when examined revealed the presence of *Actinomyces* rosettes, non-septate thin filaments, and rods of different sizes as well as coccus forms, all of which stained well by Gram's method. The coccus forms are prob-

ably for the most part products of the degeneration of the filament. Jordan supports this view in regard to similar forms of *Actinomyces* found in cattle, sheep, hogs, and man. The *Actinomyces* rosettes were found to be present in the depth of the agar. This shows the anaerobic nature of the organism. From two of the above cultures, the writer has recently successfully grown pure sub-cultures on coagulated horse serum in sealed tubes, kept at the temperature of 37.5° C.

Five seedlings of *M. cerifera*, which the writer had previously grown from seed in the University of Pennsylvania Greenhouse, were then removed from the soil and their root systems loosened from adhering sand by gently washing in clean water. With the aid of Mr. Lambert, of the University Gardens, who, like the writer, took special care to insure against sources of infection by other organisms, the root systems were one by one quickly dipped into 1:1000 corrosive sublimate solution and then washed in sterile distilled water. While Mr. Lambert, with sterile hands, held each seedling so treated, the writer, by means of a long needle previously sterilized by passing through the Bunsen flame, removed a small portion of the *Actinomyces* culture from one of the tubes and pricked it into the root of four seedlings, marking the place of inoculation by tying a sterilized piece of cord just above the puncture. The last seedling was treated similarly to the first four, with the exception that it was merely pricked with a sterile needle. This served as a control. Each seedling was then planted in a sterile pot containing sterile sand. Both pot and sand were previously sterilized in the hot air oven at a temperature of 210° C. for eight hours. The potted seedlings were then placed in a special case in the Greenhouse and daily watered with sterile Knop's solution. At the expiration of nine weeks, the seedlings were carefully removed, washed in clean water and their roots examined for the presence of tubercles. These were found in a primitive state at the points of inoculation on all but two, including the control, which was pricked with a sterile needle only. (This merely developed the usual healthy suberous scar tissue.) Thin hand sections of one of the tubercles revealed the presence of *Actinomyces* in the same condition as observed in the cells of the tubercles of the *M. cerifera* seedling, as well as of the tubercles on the other species above noted. The appearance of the infesting *Actinomyces* within the cells of the host plants will be treated under the caption dealing with the histology of the tubercles.

#### GROSS STRUCTURE OF TUBERCLES.

The writer has found tubercles on the *M. cerifera*, *M. Caroliniensis*, and *M. Macfarlanei* seedling primary roots of five to six months' growth, and from thence onward on the secondary roots inserted on the hypocotyl axis, on nearly all the adventitious roots of subterranean branches and on the subterranean branches of *M. cerifera*, *M. Caroliniensis*, *M. Gale*, *M. Macfarlanei*, and *Comptonia aspleniifolia*.

The tubercles occur either singly, as is frequently the case on subterranean branches, in small groups the size of a pea, or in larger coralloid loose or compact clusters which frequently attain the size of a large black walnut. Each tubercle is a short cylindrical blunt ended root-like structure which branches di or trichotomously after attaining a certain length. The branches frequently rebranch at their tips which grow out into long thread-like structures from 1-3 cm. in length,

which may also branch and become entwined about the roots of other plants. The maximum length of a tubercle is five mm. The average length of the branches is from 2-3 mm. The color of the youngest tubercles is a pinkish gray brown. As the tubercles become older their color changes to brown, dark brown, and even black.

#### HISTOLOGY.

The tubercles when studied microscopically exhibit the following structural detail:

A cork constituted of from 2 to 4 layers of suberous cells, whose outer ones are dead, filled with gummy lignin, and in the process of exfoliation, forms the external bounding layer. The cork tissue is derived from the outer layer of pericambium of the host root which functions as a phellogen during the development of the tubercle. Beneath the cork lies a very broad cortex which, instead of being formed as in normal roots of 5-12 layers of cells separated by large intercellular air spaces, is constituted of from 15-24 layers of very closely united parenchyma cells. The outer 3-5 layers of this region are composed of rounded to tangentially elongated cells, some of which contain starch grains, others tannin, a few gummy lignin. Underneath this lies a zone usually 2 to 3 cells broad of radially elongated cells and a few smaller rounded cells which are separated by small air spaces. The radially elongated cells are hypertrophied and contain the *Actinomyces* parasite, which may or may not be enveloped by gummy lignin. Many of the abutting smaller cells are rich in tannin and show no evidence of the parasite. Beneath this zone of infested cells is found usually a broader zone of smaller isodiametric cells intermingled with a few oblong cells. In *M. Carolinensis* as noted by Chevalier, in *M. Macfarlanei*, *M. Gale* and *Comptonia asplenifolia* as noted by the writer, it frequently happens that other cells scattered without order throughout the cortex are also infested by *Actinomyces*. These, like those of the infested radially elongated zone, are also hypertrophied. All of the infested cells are united by means of *Actinomyces* threads which run through the cell walls from cell to cell as well as the intercellular air spaces. The endodermis or innermost layer of the cortex is composed of small oval thick-walled cells which contain a yellowish brown substance (gummy lignin). The walls of these cells become suberized very early. Underneath the endodermis is found the vascular cylinder, which is quite reduced in size as compared with that of the normal root. In the young tubercle it is constituted of a radial tetrarch fibro-vascular bundle which surrounds a small pith. The phloem elements of the bundle become inactive very early. The xylem is composed mostly of wood fibres intermingled with a few tracheae. Secondary development is of very short duration.

In the younger tubercles the vascular cylinder extends only part way into the apex, while in older ones the cylinder with some cortical parenchyma cells surrounding it grows out into a slender thread from which lateral branches are then cut off.

*Actinomyces* living in the tubercles is best observed in its various relations, in a radial longitudinal section. There the youngest stages may be observed in the meristematic region of the apex, while the older stages may be traced back toward

the base of the tubercle. As observed by Shibata in *M. rubra* tubercles, the writer has likewise noted in the case of the tubercles of *M. cerifera*, *M. Carolinensis*, *M. Macfarlanei*, *M. Gale*, and *Comptonia asplenifolia* that the differentiation of the ring of infested cells starts in the meristem near the growing apex, thus indicating that infection takes place acropetally. Since tubercles are found on the seedling roots of 5-6 months' growth, it would indicate that infection takes place very early in the life of the young seedlings.

These infested meristematic cells become radially elongated and are found to contain several extremely fine non-septate and branched thread-like structures. The *Actinomyces* (*Streptothrix*) threads extend through the transverse and longitudinal walls of these cells, aided evidently by the secretion of a ferment which dissolves the cell wall in the line of the organism's progress. They then invade neighboring cells where they run between the starch grains toward the nucleus around which the organism seems to derive its greatest benefit. Shortly after the appearance of parasite threads within the invaded cells, the starch grains become dissolved, and in this form are appropriated as food by the organism. The nucleus becomes hypertrophied and finally perishes. The endophyte by this time has grown very rapidly into a dense thready reticulum. Gummy lignin appears at first of a clear yellow color, but later becoming yellowish brown. The dense thready web of the organism sends out clusters of radial thread branches forming an *Actinomyces* rosette, which in many cells completely fills up the whole cell lumen. These threads frequently become club-shaped at their extremities. Some of the threads after piercing through the wall of a cell develop clavate ends. In due course of time, as is evidenced in many older infested cells, the fungal threads become shrunk together and impregnated with gummy lignin, forming a good-sized lump of degenerating material within the cell, which remains connected with similar lumps, or mycelial webs of adjacent cells by means of threads which penetrate the cell wall. Some of the cells containing the rosettes also show coccus-like forms, while other cells, especially in the older basal portion of the tubercle, are almost completely filled with these. These cocci are probably products of the disintegration of the filament. They may be involution forms of the *Actinomyces* organism which appear in cells whose contents are poorly adapted to the trophic needs of the endophyte. Their presence in such large number on artificial culture media would support this hypothesis. While *Actinomyces* is the primary infecting agent responsible for the tubercles on *Comptonia asplenifolia*, there frequently later appears in the cells and intercellular air spaces of some of the tubercles a mycelium producing fungus with unseptate hyphae belonging probably to the *Comycetes*, as Harshberger suggested. The hyphae of this fungus are several times as thick as those of *Actinomyces*. They penetrate through the cell walls of the tubercle, passing from cell to cell, and often coil up into a mycelial mass in many of the cells invaded.

Since *Actinomyces* is frequently a virulent pathogenic organism in cattle, and other domestic animals up to man, because the swellings it produces on plants are analagous to those on animals, since the forms of the organism as shown by Jordan<sup>18</sup> in the infested lesions of animals are similar to those which the writer has described in the lesions of *Myrica*, and since the cultural characteristics of

the organism isolated from the lesions of animals by Wright,<sup>19</sup> Wolff and Israel<sup>20</sup> are in many respects similar to those isolated from the *Myricas* and described by the writer, he would regard the organism as a parasite and suggest its possible pathogenic relation to such animals.

The *Actinomyces* not only confines itself to the cortex of the tubercular roots, it later works its way into the tracheae of these structures, passes into the pitted vessels of the main roots, thence into those of the stems, and, conveyed by the transpiration stream gradually upward, is carried through the axes of catkins so as finally to reach the flowers, bracts, and fruits. In these it confines its existence to the parts corresponding to the mediocortex of the root tubercles, namely, the mesophyll and outer mesocarp regions respectively.

The writer having isolated the organism in pure culture from the lesion produced by it on the seedling tubercles, hereby assigns to it the name *Actinomyces Myricarum*.

*Actinomyces Myricarum* has been observed by the writer in its most luxuriant form in the cells of the middle fruit wall of the various species studied. Here it can be recognized best in thin hand sections stained with safranin and methyl-green in the form of rosettes almost filling the cell lumina. When the fruits fall to the ground and subsequently break open their walls, the organism probably makes its way from the infected cells into the soil where it spreads through wide areas infecting the roots and stems of other *Myricas* and producing characteristic lesions.

#### THE AVERAGE COST OF PRESCRIPTIONS.

The following schedule was prepared by F. W. Nitardy and is compiled from answers to *Question 15*, of the Colorado Pharmaceutical Association, presenting the following interrogatories: "Have you ever taken the time to calculate the average cost of prescriptions and the average price received? Can you furnish us with figures, giving:

- A—Cost of materials used in filling 1,000 consecutive prescriptions?
- B—Estimate of the number of hours of time required to fill them?
- C—Cost of containers, labels, corks and other incidentals necessary?

D—Estimate of overhead expense (excluding clerk hire), such as light, rent, heat, telephone, insurance, interest on investment, taxes, waste, etc., on your prescription department for a period covering the number of days in which you will fill 1,000 prescriptions?

E—The price received for the same 1,000 prescriptions?

The answers scheduled are:

1000 Prescriptions	A	B	C	D	E
Est. of hours required for compounding	200	250		164	212½
Cost of materials.....	\$144.14	\$165.01	\$134.50	\$140.00	\$210.00
Cost of time (estimate).....	60.00	100.00	43.00	82.00†	85.00†
Cost of containers.....	25.00*	23.36	36.00	29.75	25.00*
Overhead expense (estimate).....	49.35	66.43	36.50	122.96	148.25
Total cost .....	278.49	354.80	250.00	374.71	468.25
Price received .....	493.55	511.00	445.50	500.00	525.00
Cost .....	278.49	354.80	250.00	374.71	468.25
Gross profit .....	215.06	156.20	195.50	125.29	56.75
Percent gross profit on selling price.....	43.5	30.56	42.8	25.	10.8

1000 Prescriptions	F	G	H	I	J	Average
Est. of hours required for comp.	184	208	250	225	245	215½
Cost of materials.....	\$217.20	\$217.60	\$188.37	\$198.87	\$215.00	\$183.07
Cost of time (estimate).....	73.60†	83.20†	100.00†	90.00†	98.00	81.48
Cost of containers.....	25.00*	25.00*	23.36	25.00*	30.00	26.75
Overhead expense (estimate).....	75.00	35.51	66.43	75.00	80.00	75.54
Total cost .....	390.80	361.31	378.16	388.87	423.00	366.84
Price received .....	553.00	507.00	511.00	500.00	500.00	504.60
Cost .....	390.80	361.31	378.16	388.87	423.00	366.84
Gross profit .....	162.20	145.69	133.84	111.13	77.00	137.76
Percent gross profit on selling price .....	29.33	28.73	26.19	22.22	15.4	27.3

He follows these statements by an analysis of the reports and asks pharmacists to think, investigate and act in order to place professional pharmaceutical service on a higher plane.

#### WHAT DO THE ABOVE FIGURES SHOW?

Briefly, that the average cost of a prescription is  $36\frac{2}{3}$  cents, bringing an average retail price of  $50\frac{1}{2}$  cents, or an average gross profit of  $13\frac{3}{4}$  cents, or  $27\frac{1}{3}$  cents on every dollar taken in on prescriptions.

What is taken out of the gross profit before it becomes net profit?

If you will look at the cost items you will see that the cost shown in the above figures only brings the prescription to the point of furnishing you a finished and salable piece of merchandise, making it equal to any other merchandise you have for sale. The only point in which it has the advantage over other merchandise is its immediate turnover.

To make myself a little more clear let us assume that you are subletting your Prescription Department to a second party who furnishes everything included in the above cost, but wants your service as manager and your clerk's time to wait on the customer, that is, take in the prescription and hand out the finished prod-

† No cost estimate was furnished in these papers. The cost was based at 40c an hour, which is equivalent to \$100.00 per month salary on a 60 hours per week schedule, making no allowance for waste of time, care of stock, etc.

\* No cost of containers were given in these papers. The sum of \$25.00 was inserted by Mr. Nitardy as a conservative estimate.

ucts. You take in the money, and assume all the responsibility, including that of accounts and collections. What would it cost you to give this service? I doubt that it could be handled on less than 25%, it might take 30. But whatever your estimate is, subtract it from 27 $\frac{1}{3}$ %, the average gross profit on prescriptions, and you have *your net profit*.

Is the result satisfactory?

Why should pharmacists place such a low value on their service? Or must we look elsewhere for the reason for this condition?

The consensus of opinion at the Convention in Boulder was that druggists as a rule do not know what part, if any, of the money taken in on prescriptions is profit, for considerable time is required to obtain figures like those shown above. No doubt that is the real reason.

You are entitled to a profit on the merchandise sold through the prescriptions as well as to a small fee for your professional service, knowledge and responsibility, and I believe it is worth your while to investigate whether or not you are getting what you should and what the public expects you to get.

The Pharmacist is a public servant carrying grave responsibilities, and public safety demands that he be compensated for his service.

*Think—Investigate—and then ACT.*

---

## SOLUTIONS.\*

---

J. ROEMER.

---

In a consideration of the subject relating to solutions, whether applying to such as are used in pharmacy for medication or to such as are used in the applied sciences as well as natural solutions, due observance should be directed to the fundamental factors which govern results obtained or sought.

The meaning of the word "Solution" as applied in pharmacy is restricted and in this relation the Pharmacopœia further restricts its application by designating such aqueous preparations only without sugar in which the substances acted upon are wholly soluble in water and in this by again further excluding volatile and gaseous substances.

This cannot be considered broad enough in scope of meaning to obtain a clear idea when we use the word solution, for as such it is applied in meaning to far greater extent and comprehensive intent.

In its widest latitude we understand a solution to be homogeneous mixture of two or more substances and from this definition can encompass the conditions of

---

\* This contribution was intended for the Section on Practical Pharmacy and Dispensing, but reached Chairman Osseward after he had returned from the convention. We print this paper not only for its value, but to honor a man who served the Association and was a strong support of the Journal. Mr. Roemer was President of the New York Branch of the American Pharmaceutical Association. Notice of his demise will be found in this issue.

the three states of matter ; gaseous, liquid and solid, which give rise to nine phases as solutions.

A diagrammatic arrangement of them would be as follows :

	Gas,		Gas,		Gas,
Gas,	Liquid,	Liquid,	Liquid,	Solid,	Liquid,
	Solid,		Solid,		Solid,

in which any homogeneous mixture as a gas with a gas, a liquid with a solid, a solid with a gas, etc., would be a true solution.

There is, however, another class which in speaking of solutions we must not overlook. These are not in the accepted use of the word true solutions, yet are so designated.

These are the colloidal solutions which to ordinary appearances exhibit the conditions of true solution but in reality differ from such in being heterogeneous and differ from them in a number of physical properties determined by lowering of freezing point, lowering of vapor tension of the solvent, and osmotic pressures.

From recent advances made in the study of the colloidal phases of matter, promise is fair to assume that this will occupy a most important place in pharmacy, and the more so when we realize that about 65% to 75% of the preparations of pharmacy are colloidal in their nature.

The present status of conditions in pharmacy is such that little attention is given to means employed for differentiation and to most of us when solution is mentioned our ideas are limited to mixtures of gas in liquids and solids in liquids in terms of substances and solvent.

In so far as this applies to solutions it must necessarily as well apply to the pharmacy in general of solutions: in which the essential result sought is to furnish such in manner and means admissible for medication.

As first consideration we direct attention to the laws of physics and these laws govern results obtained.

All solutions are subject to condition and influence which determine their nature.

When a substance is brought into contact with a solvent it enters the solvent by reason of a force quite as a gas will enter a vacuum, wherein diffusion takes place until homogeneity is produced and a definite ratio is established between the concentration of the substance and solvent.

Saturated solutions are solutions in which equilibrium between the substances as solid and solvent is brought about when the concentration of the non-dissociated portion of the substances has reached a definite value. This value is constant and definite for each particular substance in relation to its solvent at any given temperature and pressure.

In true solutions the accepted ideas are fundamentally based upon the solvate theory of solution and this in particular as generalization holds that there is a reciprocal exchange between substance and solvent in which the substance not alone is combined with the solvent, but also that the solvent combines with the substance.

Colloidal solutions on the other hand are solutions of substances in which the

substance is not dissolved but is dispersed in the presence of a solvent and according to fineness of division is termed either a colloidal solution or colloidal suspension.

To the latter class belong most of our pharmaceutical preparations as fluid extracts, mucilages, most tinctures, syrups, aromatic waters, emulsions, etc.

A knowledge of the physical properties of substances will determine the class of solutions which substances and solvent will produce.

Perhaps of greater concern to pharmacy is, not the scientific aspect of the various factors which enter into the problem of solutions, for that is experimentally obtained and results given in books of references, but attention is directed more to the factor of stability and possible changes which may occur from time of preparation until such are used, yet a knowledge of the fundamentals which enter in the preparation of solutions will often obviate and prevent disaster. Of the many solutions called for aqueous solutions by far predominate and in this relation we will first consider such as to stability. We must of necessity direct our attention to the physical properties and knowing such we can give definite answer to question of permanence.

Decomposition is a change brought about in solutions wherein degree of inherent energy is weaker than the energy of influence to which it is exposed, whether this be through the agencies of light, heat, electrical current, bacteria or enzymes.

The application of this can be drawn still closer and we can classify substances in relation to decompositions a little more definitely and predicate. That all inorganic substances which per se are strongly electrolytic will produce permanent aqueous solutions even to very high dilution. Similarly all derived organic substances with strong electrolytic radicals will produce permanent aqueous solutions.

Inorganic substances of weak electrolytic activity will decompose in aqueous solution even in high concentrations.

Derived organic substances are divided into two classes dependent upon inherent potential energy—those of strong influence giving rise to permanency in aqueous solutions and those of weaker activity subject to decomposition.

To obviate decomposition in solution gives rise to a number of procedures such as the addition of substances to act as preservative in case of solution being subject to decomposition by bacteria. Sterilization and subsequent means to exclude possible contamination, this being effected in various ways to meet the need of the occasion.

Under conditions of substances in solution, as solutions being affected by agencies of light or heat, this to great extent is prevented by precautionary measures and further attention to exclude these agencies.

The decompositions in solutions that may arise through reaction of different substances are subject to the known reaction which chemistry now, but physics to come, determines and can be wholly eliminated from knowledge of the principles involved.

Clarity—This condition of solutions is wholly dependent upon constituents and nature of purposes intended.

Processes entering for classification are dependent upon physical means and determined by nature of object sought.

Solutions other than aqueous for which occasion requires preparation may include an infinite range encompassing every conceivable substance with respective admissible solvent from the mechanical suspension as mixture to the typical solution, yet each and all are dependent upon the influences of broad generalizations applying.

It is not the purpose as perhaps was intended by Mr. Osseward when he requested me to contribute a theme along lines of practical pharmacy to detail specific instances upon individual solutions for that in itself would of necessity be very limited owing to lack of experimental data, yet it would no doubt prove intensely practical and I trust the future will permit a presentation along such lines.

The foregoing, though somewhat concise in statement, will furnish themes for future elaboration and if sufficient interest is aroused, it will have served its purpose at least, for a subject which is infinite in magnitude, for in its application to observed phenomena all such is dependent upon solution.

---

## THE COÖPERATION OF SCIENCE AND INDUSTRY.\*

---

A. R. L. DOHME.

---

Individuals, firms, corporations, states and nations have begun to realize and appreciate that coöperation among themselves for the attainment of any end is essential if the best attainable results are to be achieved. Let us take as a concrete example for all the above the rather remote but timely and pertinent subject of price cutting and the European war, both of which are menacing and crying evils.

Price Cutting—A manufactures a standard article which sells at 50 cents retail according to A's business plan. It probably costs 20 cents to produce and with advertising and the profit to the jobber and retailer nets the manufacturer 10 cents profit. The retailer instead of coöperating with the manufacturer and making his 25 percent net profit on it cuts the price and makes 5 percent, using it to advertise his store as a place to buy cheaper than at other stores. If it only went so far there would not be lack of coöperation and the manufacturer would be satisfied. Instead, however, the retailer induces the customer to buy his own manufactured article upon which he makes a good profit, or the retailer is seduced by competing manufacturers to buy a bulk supply of the same article under another name, which is sold in place of the originally advertised and controlled article. Both of these methods show entire absence of coöperation between the retailer and manufacturer and result in lack of real success to the manufacturer and the retail trade as a whole.

The European war is the result of commercial rivalry or rather lack of coöperation. If nations had been satisfied to live and let live and permitted each other to work out to perfection unmolested those products of nature and industry espe-

---

\* Read before Scientific Section, San Francisco meeting.

cially adapted to and characteristic of that nation, there would have been no European war. In this all nations are more or less at fault. Labor and capital must coöperate if they are to progress and get on peaceably together. As soon as capital gets more than its just share of the profit labor will rise in arms, and as soon as labor is misled by bad and badly intentioned leaders to exact more than its just share, capital will protest. As soon as coöperation on a mutually satisfactory basis is established and maintained strikes and labor problems will cease.

The reason why Germany has progressed so much faster than any other nation in most lines of industry and why "Made in Germany" caused a war of destruction unequalled in history is, because in Germany coöperation exists in everything—government, education, industry, art, science, and the home. I would like at this time to refer to only one phase of coöperation, viz., the coöperation between science and industry because to my mind it is most typical of methods and results and, because as chemists it concerns us especially. Germany's preëminence in scientific education and university training is universally acknowledged for any one who has attended her universities knows that every nation sends many of her favorite sons there to be educated. In those halls and laboratories you see the American, Frenchman, Swede, Norwegian, Russian, Englishman, Japanese, Chinaman, Italian, Spaniard, East Indian, Greek, Turk, etc. This education and this research into the hidden secrets of science would of themselves help little to advance Germany. She goes further, and when her professors, teachers and students select a subject to investigate they do not always take up an abstruse subject which is only of purely scientific interest. Most frequently they take up some of the troublesome problems which are today confronting the industries of Germany and thus, besides gaining the experience and training their minds and hands need, they at the same time solve one of the many knotty problems which the manufacturer has unsuccessfully encountered and failed to solve.

My experience is probably typical of all. My "arbeit," as such research work is called in Germany was selected from about fifty available problems sent by the manufacturers to the universities for solution. The professor took me into his private laboratory and there, exposed upon a series of tables were samples of what was wanted and what was available as raw materials or by-products to be used in the work. The professor considers that he is doing his country a service every time he can help solve a problem of some industry and, as a result, all the great universities are coöperating all the time with the industries. The result speaks for itself:—German prestige in almost all lines and an industrial and commercial boom during the past 40 years unprecedented in history. The result of a coöperation instead of a holding aloof. It is this same coöperation that is enabling that great nation to hold at bay and practically defeat the entire concert of great nations of Europe, and Asia and Australia and Canada. The principle of coöperation is applied in practice and in spirit from the lowest private in the ranks, charwoman, housewife and children in the home to the highest head of every institution, civil and military. It has been a slogan that "in union there is strength." To my mind a better and truer slogan, because it also embraces the former, is "in coöperation there is success."

Contrast this with the attitude of our universities in their relation to our indus-

tries. They stand at bay, each too dignified to lower themselves to approach the other. The university professor considers it beneath his dignity to soil his hands with commerce or industry and the manufacturer considers it beneath his dignity as a successful, practical man to ask help of a man or an institution which considers and recognizes only the theoretical and disdains the practical side of any problem. Neither of them consider for a moment their common country and its progress and development among the nations of the world. To my mind the one nation is inspired by patriotism in its professional men, the other is inspired by personal advancement at the expense of the country and every one else. While this arraignment may be a trifle severe—for there are exceptions to it—the fact remains that there is more truth than imagination or exaggeration in it. The thing for our universities to do for our industries is what the Rockefeller Institute is doing for medicine. To so study diseases that the net result is not a splendid article in a journal or a book to glorify the author and discoverer, but instead an ability and means of curing them, preventing them, or doing both which is best of all. Let the men who are being trained in our universities fit themselves, each for some chosen industry so that when he completes his course he will know his science or subject thoroughly and besides will know enough about its application to some industry, say the manufacture of glass, so as to be able to establish a research laboratory for some glass factory and work out for them improvement in manufacture, further adaptation of glass to industries and possible utilization of waste products for producing economies in manufacture. In this way all our industries will progress and our country will prosper and grow in wealth, importance and contentment at several times the rate it is now. Our institutions of learning, hospitals, etc., should do more than this. They should welcome an opportunity to let any manufacturer try out or test his products in their clinics, laboratories, shops, etc., instead of hanging out a banner "noli me tangere."

Let me in closing point out the instance of what a university man so trained can do for an industry. The man was my fellow student who did his final preparation for the degree of Doctor of Philosophy with me for two or three months. (Another instance of the same spirit of coöperation, this time in study.) This was in 1889. The institution was the Johns Hopkins University. He had paid a little attention to petroleum because he saw in it a great future. He entered the employ of the Standard Oil Company. He worked conscientiously and applied practically all the knowledge he had learned at his alma mater. The result is the unexcelled world-leading petroleum industry. He is now its Second Vice President and he can feel most proud, although I know him to be a most modest man, because he has accomplished something for each of his fellow citizens in producing cheaper and better kerosene, gasoline, oil, wax, etc., than they had before and because, above all, he has placed his country in his line on the top rung of the ladder, for the Standard Oil Company is known the world over and is perhaps the most successful and extensive corporation known in the world. This case cannot be claimed to be an instance of the coöperation of which I am writing because the university did not especially prepare him for his work, rather did it expect him to become a professor; but he worked out the result for himself,

because he was eminently practical. This result shows however what is possible when science and industry coöperate. Why not train men for every industry so that glass, leather, sugar, paper, steel, iron, copper, cellulose, cotton, wool, bricks, cement, laundrying, silk, fertilizers, chemicals, dyes, etc., etc., can progress and excel just as did the petroleum industry under the skillful scientific guidance of William Merriam Burton.

The coöperation of science and industry can achieve this, and in my opinion nothing else ever will achieve it. In fine, the next great advance and development that this country will witness will be in her industries when these become standardized as the result of the coöperation of the science of the university with the practice of the factory, said coöperation to begin in the university and *not* after leaving the university. May this great advance come about now when the world is paralyzed by the clash of arms and the decimation of human lives and needs the help of our country more than it ever will. Let me in conclusion suggest that the Chamber of Commerce of the United States of America, a most efficient product itself of coöperation, call a conference of the heads of all our universities and of all our great industries and at that conference proclaim the gospel of "coöperation spells success" and as well, forge the link which will weld into an indissoluble union science and industry.

---

## INCREASE IN THE ACIDITY OF HYDROGEN PEROXIDE UPON STANDING.\*

---

C. F. RAMSAY AND A. M. CLOVER.

---

Most brands of hydrogen peroxide which are found upon the market are labeled as conforming to the requirements of the U. S. P. In the manufacture of this product it is not a difficult matter to properly regulate the amount of free acid, which must be below 1/100 normal. In Bulletin No. 150 (1912) of the Bureau of Chemistry, by Kebler, Warren and Ruddiman the fact is brought out, that most commercial brands of peroxide are excessively acid. The samples examined by these investigators were purchased from wholesalers so that they might be obtained in as fresh condition as possible. The acidity and strength were determined upon opening and the stability was ascertained by subsequent titrations. Apparently only one determination was made of the acidity.

From observations which we have incidentally made during a period of several years, we have been lead to believe that the unusually high acidity frequently noted in peroxide which contained acetanilid, is due in most cases to an oxidation of the preservative; for we have frequently observed that samples containing this substance gradually increase in acidity on standing.

The fact is well known that hydrogen peroxide containing acetanilid often takes on a yellowish-green color, as well as a disagreeable odor, due to the oxidation of the preservative, and we have observed that this change is accompanied by a loss in the strength of the active substance. A very stable peroxide does not develop a color even on long standing, while this effect is soon noticeable in a product

---

\*Read before Scientific Section, San Francisco meeting.

which is rapidly decomposing. In the latter case, it can be readily seen that substances giving rise to color and odor are only the intermediary steps in the attack upon the preserving body, for the solution in time again becomes colorless. We have found that a solution of hydrogen peroxide, which was practically free from all impurities will lose nearly 50 percent of its strength, if kept for a year in a glass-stoppered bottle in the dark. By adding a small amount of acetanilid to the solution, the decomposition is reduced to 3 percent. If however we added acetanilid to a peroxide containing impurities capable of affecting it catalytically, the decomposition while temporarily retarded, finally resulted in the complete destruction of the benzene ring, apparently with the formation of substances having a high acid value. Kebler, Warren and Ruddiman (Bulletin 150, p. 22) failed to find acetanilid in some samples in which its presence was admitted on the label, and in another case only traces were found. It appears from their figures that in all these cases the peroxide itself was decomposed to a great extent, and we are justified in assuming that the preservative had been destroyed by oxidation. These authors also concluded in a general way, that the effect of acetanilid upon different lots of peroxide is not the same, so far as preventing their decomposition.

Kebler, Warren and Ruddiman (Bulletin No. 150, p. 22) state that the acidity of peroxide solutions is determined preferably by direct titration using phenolphthalein as indicator. Our experience has been the same, and we have satisfied ourselves that if the titration with N/10 caustic is carried just until a faint pink is reached, the presence of the hydrogen peroxide in the solution has little influence upon the results. In the experiments described below the acidity has been determined in this way. The hydrogen peroxide was determined by means of N/10 potassium permanganate, standardized just before use.

Samples of a number of brands were purchased from wholesale supply houses in New York, with the object of obtaining as fresh material as possible. The strength of these samples as well as their acidity, were determined when they were received, and after they had stood for 1 year in subdued light at ordinary temperature. The results are as follows:

TABLE I.

Brand No.	Original Strength in $\text{H}_2\text{O}_2$	Final Strength in $\text{H}_2\text{O}_2$	Original Acidity in N/10 KOH for 50 cc.	Final Acidity in N/10 KOH for 50 cc.	Acetanilid Present and Stated
1	3.31%	3.05%	4.15 cc.	5.8 cc.	yes
2	3.21	2.59	4.6	5.6	yes
3	3.03	2.76	2.5	3.2	yes
4	3.13	2.89	4.7	7.2	yes
5	3.32	3.17	1.7	4.5	yes
6	3.51	3.18	2.5	5.7	...
7	2.93	1.41	5.5	12.6	yes
8	3.07	.94	4.1	5.0	yes
9	2.48	.30	1.4	.8	...
10	3.11	1.10	5.7	13.3	yes
11	3.02	2.81	2.8	4.4	yes
12	2.79	1.02	2.9	3.1	...
13	2.93	2.68	1.7	2.5	...
14	3.12	1.46	4.2	4.6	yes

All of these products are represented to be U. S. P. except Nos. 6, 7, 9 and 14. Product No. 9 is stated upon the label to be about  $4\frac{1}{2}$  percent. It probably contained no preservative as it was found to be very unstable, and there was no increase in the acidity after a year's standing. Products 6, 9, 12 and 13 contained no acetanilid according to label. Numbers 6, 12 and 13 were shaken out with ether, followed by chloroform, and a distinct residue so obtained in each case. The samples were small, so that the residues so obtained could not be positively identified. In each case they were found not to respond to the isonitrile reaction for acetanilid. Product No. 12 kept very poorly, but there was practically no increase in acidity. Numbers 6 and 13 kept tolerably well and showed considerable increase in acidity. Among the samples containing acetanilid, the relation between decomposition and increase in acidity is not uniform, although numbers 7 and 10 which show the highest increase, are seen to have been largely decomposed.

In order to test out this matter still further, we attempted to prepare a small experimental lot of hydrogen peroxide in a practical way, although we used every precaution to obtain as pure and stable a product as possible. The strength was adjusted to a little over 3 percent, the acidity to about one-half of that permitted by the U. S. P., and three grains acetanilid were added to each pint. The solution was filled into amber bottles which had been previously washed with warm water, rinsed with distilled water and allowed to dry. The exact strength and acidity of these bottles was determined at the start and they were then allowed to stand for a year, alongside the samples previously discussed.

Initial strength, 3.20 percent.

Initial acidity, 2.85 cc. N/10 KOH for 50 cc.

At the end of the year the results were as follows:

TABLE II.

Bottle No.	Final Strength in $\text{H}_2\text{O}_2$	Final Acidity in N/10 KOH for 50 cc.	Bottle No.	Final Strength in $\text{H}_2\text{O}_2$	Final Acidity in N/10 KOH for 50 cc.
1	3.06%	4.3 cc.	16	3.06	4.2
2	3.05	4.7	17	3.05	4.4
3	3.05	5.0	18	3.08	4.2
4	3.06	4.3	19	3.05	4.4
5	3.08	4.4	20	3.06	4.6
6	3.06	4.3	21	3.06	4.4
7	3.06	4.6	22	3.05	4.8
8	3.07	4.8	23	3.05	4.3
9	3.07	4.3	24	3.08	4.5
10	3.08	4.5	25	3.05	4.6
11	3.06	4.4	26	3.08	4.4
12	3.06	4.6	27	3.06	4.5
13	3.06	4.2	28	3.06	4.7
14	3.06	4.4	29	3.06	4.3
15	3.06	4.5			

It is evident from the results of Table II that in the case of a relatively stable product, there will be a decided increase in acidity after a year's time; however, if the initial acidity be kept low, the final value will not exceed the limit allowed

by the U. S. P. On the other hand the increase in acidity of the various commercial products shown in Table I, shows that most manufacturers have not yet been able to control the uncertain factors which effect the stability of hydrogen peroxide, and the consequent increase in acidity.

The cause of the increased acidity must be due to a disintegration of the benzene nucleins of the acetanilid. In several cases the increase is much greater than can be accounted for by simple hydrolysis of acetic acid from the acetanilid.

The objection to a high acidity for hydrogen peroxide rests upon its use as a mouth wash. The organic acids formed by the oxidation of the preservative will exert no deleterious effect upon the teeth, and it is with the original mineral acidity alone that we are concerned. However, our present knowledge of the matter affords us no practical means of distinguishing between the two.

SCIENTIFIC LABORATORY OF PARKE, DAVIS & CO., DETROIT, MICH., June 28, 1915.

#### DISCUSSION.

Mr. Scoville: The point is these gentlemen have shown that when acetanilid is employed, in the decomposition which ultimately follows, there is more acid formed. We know that acetanilid has the temporary effect of a preservative agent. But the time comes when the hydrogen peroxide gets the best of it and decomposes the acetanilid itself, and then we have an odor and discoloration, which are the two objections to acetanilid as a preservative. They show the solution is more acid than it was before the acetanilid began to decompose; in other words, that excess of acidity in hydrogen peroxide solution does not necessarily mean that the excess has always been there; the acidity is partly formed by the decomposition of the acetanilid. Now, they don't give any recommendation or any definite explanation of that. They simply give a number of tables showing the facts, the acidity being determined when it was fresh and at the end of two years. Are there any questions on that?

Mr. Long: Do they figure out any possible reaction to account for the hydrolysis effect?

Mr. Scoville: They don't explain it; they have not attempted to give any explanation.

Mr. Long: Is it supposed to be acetic acid?

Mr. Scoville: Well, I should suppose so, but they do not say so.

Mr. Long: That is all I care to ask about.

---

#### RADIUM AND THE MEASUREMENT OF RADIUM EMANATIONS.

---

S. W. STRATTON, DIRECTOR OF THE BUREAU OF STANDARDS, WASHINGTON, D. C.

---

As practically all substances contain traces of radium, and consequently of radium emanation, the real problem that confronts the pharmacist and the physician is the determination of *how much* radium or radium emanation a preparation, or water, must contain in order that its therapeutic value may be appreciably affected thereby. If a lower limit to this quantity can be agreed upon, and if producers are required to state in *unambiguous units* the actual radium or radium emanation, content of their preparations, then the possibilities of successful fraud will be greatly limited.

As an example of the manner in which the use of ambiguous units assists the fraudulent, consider the "Mache unit" as a measure of radium emanation. This unit has been defined as that amount of radium emanation which when mixed

with air will produce such a rate of ionization<sup>1</sup> of the latter that the saturation current<sup>2</sup> will be  $\frac{1}{1000}$  of an electrostatic unit of current.

In order to measure this current the air and emanation must be enclosed in a vessel of some kind. It is evident that some of the alpha particles—these produce the ionization of the air—will strike the walls of the vessel and be there absorbed, thus being prevented from producing their full amount of ionization. Consequently the observed saturation current will be less than it would be were there no absorption by the walls. The percentage reduction thus caused in the saturation current is proportionate to the ratio of the total area of the walls to the total volume of the vessel. Whence it is evident that the observed saturation current corresponding to a specified amount of radium emanation will depend upon both the size and shape of the ionization chamber employed. The current alone does not suffice to define the amount of emanation; it is equally necessary to specify either the size and shape of the ionization chamber to which this current applies, or to specify that the observed current is to be corrected for the effect of the walls of the chamber. Since, whatever may be the shape of the chamber, the effect of the walls becomes ever less and less as the size of the chamber is made greater and greater, becoming exactly zero when the size of the chamber is indefinitely great, it is usual to speak of the value of the current after the correction for the walls has been applied as the saturation current in an infinitely large chamber. In actual practice large chambers are inexpedient as the voltage required to produce the saturation current in them is excessive. The correction that must be applied to the saturation current observed in any cylindrical vessel, of the kinds ordinarily used, in order to eliminate the effect of the walls has been determined. For chambers of a common type this correction amounts to 30% of the current.

Some use the term "Mache unit" to denote that amount of emanation for which the saturation current *observed* in such a vessel is 1/1000 of an electrostatic unit; others use it to denote that amount for which the saturation current *after the correction* for the walls has been applied is 1/1000 of an electrostatic unit. The same term is used to denote two quantities which differ by 30%.

This is not all. The current that is observed depends upon how long the emanation has been in the vessel. When the emanation is first introduced, the current increases rapidly, then more slowly, becomes very nearly constant about five hours after the emanation is introduced and then very slowly decreases. Observers have differed as to the value of the current to use. Some have used the Mache unit to denote that amount which will give the specified current when the

---

(1) When a gas is subjected to the radiations from radioactive substances some of its molecules are broken into two oppositely electrified portions. These charged portions are called ions; the process is spoken of as an ionization of the gas; and the vessel containing the gas that is being ionized is called the ionization vessel, or chamber.

(2) The electric current which passes through a given metallic conductor is directly proportional to the applied voltage; this, however, is not true of the current through a gas. In the latter case the current increases less rapidly than the voltage, and finally reaches a value beyond which it cannot be increased even though the applied voltage be increased many fold. This maximum current is known as the saturation current. The voltage required to produce the saturation current depends upon the rate of ionization of the gas, and upon the size and shape of the ionization chamber. The smaller the rate of ionization and the smaller the distance between electrodes of the ionization chamber, the smaller will this voltage be.

emanation is *first* introduced into the vessel; others have used it to denote that amount of emanation which, *when in equilibrium* with its products of disintegration, will give the specified current. *The first is nearly three times as much as the second.*

Although the best practice requires that this unit be defined in terms of the current produced by the emanation without its products of disintegration and in a vessel of infinite size, still the other uses are sufficiently numerous to protect one who desires to use them for fraud.

In the above the term "Mache unit" was used to denote the *amount* of radium emanation. It is frequently so used; but in its original use and as used by many it denotes a concentration of emanation. A water is said to have one Mache unit if the emanation *from one liter* of the water will, under specific conditions, produce a saturation current of 0.001 electrostatic unit.

Good authority can be found for both uses. Here again fraud is possible. If a bottle containing two liters of water is said to contain 2000 "Mache units," does this mean that *each liter* contains sufficient emanation to produce in air such an ionization that the saturation current under the specified conditions is  $2000 \times 0.001$  electrostatic units; or is there only this much in the entire bottle?

All of this ambiguity can be avoided by the use of a carefully defined unit. Such a unit which has international sanction is the "curie." This is defined as the amount of emanation which can exist in equilibrium with one gram of radium (element). The latter is exactly defined by the International Radium Standard which is preserved in Paris, and with which the standard of this Bureau has been compared. One microcurie (=one millionth part of a curie) is approximately equal to 2700 times that amount of radium emanation which is designated by the "Mache unit" under its best sanctioned usage as a *unit of emanation*. Consequently one thousandth part of a microcurie (=one millimicrocurie) corresponds to 2.7 of these "Mache units."

Concentrations of emanation should be expressed in terms of *curies per liter*. Then a water containing 2.7 "Mache units," as used in the most approved sense as a *concentration unit*, would be said to contain one millimicrocurie per liter. If preferred, the expression "one thousandth of a microcurie" may be used instead of "one millimicrocurie."

There is likewise an indefiniteness in many statements referring to the use of sealed specimens of radium salts for gamma ray treatment. It is frequently stated that "so many milligrams of radium bromide," or "so much radium chloride," or "so much radium of such an activity," is used. This variation in the form of statement not only introduces confusion, but encourages fraud; especially is this true of the last.

Consider the last form first. The statement means that the tube contains the stated amount of salt and that an infinitely thin layer of a fair sample of this salt will, per gram of the salt, produce in a suitable alpha ray electroscope a saturation current that is a certain multiple of that produced per gram of uranium by an infinitely thin film of a uranium compound. Neither the weight of the salt in the tube, nor such a comparison can be made without opening the tube and removing

the salt. Even then the comparison is not practical except for very low grade salt. In practice it is never attempted.

By very careful work the activity, as defined above, that is to be expected from a salt containing a given percentage of radium has been determined to a certain low order of precision. From this work we can compute approximately the amount of radium that a tube said to contain "so much radium of such an activity" should contain. By gamma-ray measurements, which can be made without opening the tube, the total radium content of the tube can be determined. *In no case that has come to the attention of this Bureau has the actual radium content of such a tube been nearly so great as was to be expected from the stated amount and activity of the salt.*

As the dealer makes no claim regarding the amount of radium the tube contains, the establishment of fraud upon the basis of this discrepancy would be impossible. Owing to the difficulties involved in the direct measurement of the activity, and to uncertainties somewhat similar to those mentioned in speaking of the "Mache unit," the establishment of fraud even by a direct study of the "activity" of the salt would be most difficult. Such a study would also be very expensive, in fact out of all proportion to the value of any such tube that has come to our attention.

Consider now the first two forms of expression which were mentioned. Both radium bromide and radium chloride exist in two forms, viz., the anhydrous and the crystalline. The terms "radium bromide" and "radium chloride," unless further qualified, may be applied with equal justification to either salt. The crystallized bromide contains 8.5% less radium than the anhydrous; and the crystallized chloride contains 10.7% less than the anhydrous. When the price of radium is considered and one takes into consideration the fact that it is solely the radium that gives value to the salt, these differences are well worth considering.

In at least one case that has come to the attention of this Bureau the purchaser specified that he was to receive so many milligrams of radium bromide. He did not realize that there were two bromides, and even after the tubes were delivered and paid for he did not know which bromide they were supposed to contain. In this case the uncertainty regarding the amount of radium he should have received amounted to about \$300.00.

All such uncertainty can be avoided and the work of different men can be readily intercompared if all will express the content of each tube or preparation, and require the dealers to guarantee the content of all tubes and preparations in terms of the number of milligrams of radium (element) contained in them. The basis should of course, be the International Radium Standard.

It is also most desirable that the term "milligrams of radium" be used in all cases to denote solely the amount of the chemical element radium that is contained in the tube, or preparation. "Radium" is the name of a definite chemical element and its use as an abbreviation for "a radium salt" or for "a preparation containing radium" not only fails to conform to the recognized usage of chemical terms, but also introduces confusion.

Anything you or your committee can do to bring about the universal adoption

of the International Units (the "curie" and the "milligram of radium"), and the precise use of the word "radium" will be of great service to all concerned.

#### THE MEASUREMENT OF RADIUM EMANATION.

*Method:* The measurement of radium emanation is based upon the fact that, when it is mixed with air, the alpha radiation from the emanation and its products of disintegration ionize the air and thus make it a conductor of electricity.

Other things being the same, the rate of this ionization is directly proportional to the amount of radium emanation present, and thus may be used as a measure of the latter.

The maximum current that can be passed through a given gas is called its saturation current; it is a direct measure of the rate of ionization of the gas, and can be measured in various ways. The simplest method is to determine the rate at which an insulated charged body loses its charge when immersed in the gas. In current practice the leaf of an electroscope is made a part of the charged body, and the rate of loss of charge is measured by the rate of fall of the leaf. If the leaf is timed always over the same portion of its path the observed rates will be proportional to the current through the gas, and, therefore, proportional to the rate of ionization.

Ions are being continually produced in a gas even when no radium emanation is present. The observed rate of fall of the leaf of the electroscope (often spoken of as the drift of the leaf) measures the total rate of production of ions, and, consequently, is greater than it would be were no ions produced except by the emanation present. It must, therefore, be diminished by the drift that is produced by what we may call the natural rate of ionization of the air, before it can be used as a direct measure of the amount of emanation present. The drift that is observed when there is no emanation present is known as the "blank drift" of the instrument. It includes the effect of any slight leakage of electricity over the insulating supports, as well as the leakage due to the natural ionization of the air.

When air mixed with radium emanation is filtered through a plug of absorbent cotton and admitted to a vessel which had previously been partially exhausted, the emanation itself is at first the only radioactive element present. However, it immediately begins to disintegrate with the formation of a series of other radioactive elements. The alpha radiation from these also ionizes the air and so the ionization at first increases rapidly with the time. The products of disintegration, being themselves radioactive, are continually disintegrating and so a time arrives when they have accumulated to such an extent that their rate of disintegration just equals the rate at which they are formed; they are then in transient equilibrium with the amount of emanation then present. After this they decrease in amount at the same rate as the emanation itself decreases from decay, equilibrium being always maintained.

Consequently the rate of ionization of the air in the vessel at first increases rapidly, then more slowly, and after about three hours becomes, and for some time remains sensibly constant. After this it slowly decreases, at the rate of a decrease of one-half in 3.85 days.

Owing to this variation in the ionization it is advisable to take all measurements at the same time after the admission of the emanation; it is best to choose this time as three to three and three-fourth hours, for then a practically steady state has been reached and a slight difference in the times will produce no error.

In order to be able to derive from the corrected drift of the leaf the amount of emanation introduced into the vessel it is necessary to know the corrected drift which corresponds to a known amount of emanation. This depends upon the particular instrument and its adjustment and may be determined by an experimental standardization. It also depends upon the density of the air in the ionization chamber; variations in the density of the atmosphere at a given place will seldom cause changes of over 5% in the observed current and the actual amount can be readily computed.<sup>3</sup>

So far only the case of emanation mixed with air has been considered. If the emanation is dissolved in water or other liquid, or absorbed in a solid it must first be quantitatively removed and mixed with a suitable volume of air and then measured as described above. Boltwood has shown that radium emanation can be completely removed from water by vigorous boiling.

*Units.* The only unit of emanation sanctioned by the International Radium Congress is the "Curie." This is defined as the amount of radium emanation which can exist in equilibrium with one gram of radium (element).

Submultiples of this unit are designated by prefixes as in the case of other metric units. The more important of these submultiples are given in the following table.

Designation	Emanation in equilibrium with
1 curie .....	1 gram of radium
1 millicurie=0.001 curie .....	1 milligram of radium
1 microcurie=0.000001 curie .....	1 microgram of radium
1 millimicrocurie=0.000000001 curie .....	1 millimicrogram of radium

The prefix "micro," meaning small, has long been in common use in electrical measurements to denote the one millionth part of the unit. A suitable, and common abbreviation for it is the Greek letter *mu* ( $\mu$ ); hence  $\mu$  might be used as an abbreviation for micro curie, and *m $\mu$ c* for millimicrocurie.

One millimicrocurie is equal to 2.7 times the amount of emanation designated by the more common of the numerous "Mache units." The latter term having been used in several senses, and being unsanctioned by the International Congresses should be discarded. In fact Mache himself thoroughly disapproves of its general use.

*Apparatus.* The apparatus needed includes: (1) A suitable electroscope with attached ionization chamber which can be exhausted and then filled with the gas under test; (2) A microscope for reading the position of the leaf of the electro-

(3) Duane has shown that the relation between the value *I* of the saturation current observed in a cylindrical ionization chamber three hours after the introduction of the radium emanation is related to the value *I*<sub>0</sub> that would have been observed had the walls produced no effect, in the manner shown by the equation

$$I = I_0 (1 - 0.572 \frac{S}{V})$$

where *V* is the volume of the ionization chamber and *S* is its internal superficial area. The coefficient 0.572 applies to air at 15°C and 760 mm. pressure, it varies inversely as the density of the air.

scope, as means must be provided for securely fastening this microscope in a suitable position fixed with reference to the electroscope, it is advisable that it be attached to the electroscope itself; (3) A stop-watch for the determination of the rate of motion of the leaf of the electroscope; (4) A piece of sealing wax, or other means, for charging the electroscope; (5) A good aspirator, or other means, for partially exhausting the ionization chamber; (6) A standard of radium emanation; and (7) Apparatus suitable for removing and storing the gas contained in the water, or other preparation under test.

Frequently the leaf of the electroscope is in the ionization chamber itself, but there are many advantages in having it in a separate compartment entirely cut off from the ionization chamber; somewhat as shown in the sketch. If many measurements have to be made it is very desirable to have the two compartments separable so that the electroscope proper can be securely mounted and any one of several ionization chambers can be attached to it, as desired.

In the absence of a standard dilute solution of a radium salt, many observers have used for preparing standards of radium emanation specimens of pitchblendes, of which the uranium content has been carefully determined. Since the weight of the radium contained in any specimen of unaltered pitchblende has been shown<sup>4</sup> to be equal to  $3.33 \times 10^{-7}$  times the weight of the uranium, in the same specimen, the amount of radium can be calculated when the uranium content is known. If a known weight of this ore has been kept in a closed vessel for a month or longer, then the emanation in the vessel, and ore, will have come to equilibrium with the enclosed radium and consequently its amount will be known. If, now, without opening the vessel, the enclosed ore is treated chemically so as to be dissolved and thus to set free the emanation retained in it, all of the emanation will become mixed with the other gases in the vessel and it is now possible to transfer this known amount of emanation to any vessel we desire.

Whenever a standard radium solution is available its use is much to be preferred. Radium solution should be strongly acidulated with hydrochloric acid. After a volume of a solution containing a known amount of radium has been kept in a gas-tight vessel for a month or more the amount of emanation in the vessel will be that which is in equilibrium with the amount of radium enclosed. Simple boiling of the solution will drive all of the emanation out of the solution, and it can then be transferred as desired. If the vessel containing the solution is then closed and put aside the same amount of emanation will have again collected in it by the end of another month; and so on. If it is undesirable to wait for a month the amount of emanation that has accumulated up to a given time after closing the vessel can be calculated from the time constant of radium emanation.

This Bureau is prepared to supply such standards at \$5.00 each.

*Adjustment:* The eyepiece of the microscope must be so adjusted that the scale of divisions in the microscope is in good focus. Then the microscope must be so adjusted that, when the electroscope is charged so that the leaf makes an angle of  $30^\circ$  or  $40^\circ$  with the vertical, the leaf is near the center of the field of the micro-

(4) Heinmann and Markwald, Physik. Ztschr. 14 p. 303, 1913.

scope; and, when its charge is varied, remains in focus wherever it may be in the field. The scale of divisions and the leaf must both be in good focus at the same time. When this is the case a lateral motion of the eye will not cause an apparent motion of one with respect to the other.

Many trials may be necessary before a satisfactory adjustment is secured. Having secured this adjustment the microscope should be securely fastened with reference to the electroscope; and should not again be moved.

*Standardization:* (1) Determine the blank drift. To do this exhaust the ionization chamber and refill it with dried and filtered air drawn from out of doors. Do this several times. Then charge the electroscope so that the leaf stands near the center of the field of the microscope; and by means of the stop-watch determine the rate at which the leaf falls. This rate should be very slow. If it falls one division of the microscope scale in 5 minutes, then the rate of drift is 0.0033 divisions per second. This is called the "blank drift," or the natural drift of the leaf.

(2) Determine the drift when a known amount of emanation is in the ionization chamber. To do this, exhaust the ionization chamber and then fill it with the air and emanation from the emanation standard, and so much outside air as may be necessary to make the pressure inside the ionization chamber equal to that outside. All of this air should be dried and filtered. Close the ionization chamber and leave it for about  $2\frac{1}{2}$  hours.

At the end of this time charge the electroscope so that the leaf stands beyond the extreme end of the scale in the microscope. Keep it charged for a half an hour. Then, by means of the stop-watch, determine the time required for the leaf to drift from one end of the scale to the other. Then recharge the electroscope and repeat. This should be done several times.

Suppose that the number of divisions is 50, and the average time of drift is 1 min. 19.62 sec.; then the rate of drift is 0.628 divisions per second. This is the drift due to the presence of the emanation and its products plus the blank drift. Hence the drift due to the emanation and its products is  $0.628 - 0.003$  or 0.625 divisions per second. This may be called the "corrected drift."

If the emanation standard contains  $4 \times 10^{-9}$  gm. (i. e. 4 millimicrograms) of radium, and had been sealed for over a month, then it contained the equilibrium amount (4 millimicrocuries) of emanation; and, if no loss occurred during the transfer, this is the amount of emanation which was introduced into the ionization chamber.

Hence a corrected drift of 0.625 divisions per second at 3 hours after the introduction of the emanation corresponds to the introduction of 4 millimicrocuries of emanation; and a drift of 1 division per second corresponds to 6.40 millimicrocuries.

The ionization chamber should now be exhausted and refilled with dry, filtered, outside air. This should be repeated several times so as to sweep out thoroughly all traces of emanation. This ionization chamber should not be used again until the following day; this delay is necessary to allow the "active deposit" formed upon its interior to decay.

So long as the instrument remains absolutely unchanged the amount of emanation needed to produce a corrected drift of one division per second also remains unchanged. Owing, however, to experimental errors and to the possibility of unsuspected changes taking place in the instrument, the standardization should be repeated several times at the beginning of the work and then at intervals of a month or so even though no change in the apparatus is suspected. Of course, if a change is made or is suspected to have occurred, the apparatus should be again standardized before proceeding with the work.

*Measurement of Emanation:* (1) Determine the blank drift, as in the standardization. Suppose it is found to be 0.0050 divisions per second.

(2) By boiling, remove the air and emanation from a suitable volume of the water to be tested; collect it above hot water. The volume of water should be so chosen as to give a drift that can be readily timed. Let the collected gases stand for ten minutes to allow any thorium emanation present to decay. Then introduce it into the previously exhausted ionization chamber, as for standardization. After 3 hours determine the rate of drift of the leaf; suppose it is 1.005 division per second. Then the corrected drift is 1.000 division per second; and, consequently, the amount of radium emanation removed from the volume of water used is 6.40 millimicrocuries. Hence, if the volume of water used was 100 cc. the water contains 64.0 millimicrocuries per liter.

*Remarks.* It is necessary that the amount of emanation to be measured or an accurately known fraction of this amount, be introduced into the ionization chamber without loss. The timing of the leaf must be carefully done and the same portion of the leaf must be used in all observations. In the computations it is assumed that the voltage employed is sufficient to produce the maximum, or "saturation," current; under all practical conditions no appreciable error will result from a lack of saturation if the leaf makes an angle of  $30^\circ$  to  $40^\circ$  with the vertical when in the middle of the field of the microscope, provided that the ionization chamber is not over 10 cm. in diameter. It has also been assumed that the density of the air has been the same in all cases; if this is not true and an accuracy greater than 5% is desired the proper correction must be applied.

The most readily available articles dealing with this subject are probably the following:

## Scientific Section

Papers Presented at the Sixty-Second Annual Convention

### MINUTES OF THE FIRST SESSION OF THE SCIENTIFIC SECTION, INCLUDING CHAIRMAN'S ADDRESS.\*

The Scientific Section of the American Pharmaceutical Association was called to order at 2 o'clock p. m. in the Red Room of the Bellevue Hotel, San Francisco, Dr. H. Englehardt in the chair, and W. L. Scoville acting as Secretary, in the absence of Professor William Mansfield.

Chairman Englehardt: The meeting will come to order.

The first order of business, in conformity to the by-laws, will be the Chairman's address.

Mr. Scoville: We will listen to the reading of the Chairman's address.

Dr. Englehardt: In my address, I present a brief account of some of the problems which have had publicity in both the chemical and pharmaceutical periodicals.

The subject of my address is, *The Present Opportunities and Possibilities to Produce Chemicals and Remedial Agents in this Country.*

#### THE CHAIRMAN'S ADDRESS.

You recall that shortly after the European war started the price of a great many remedies which are usually imported from Europe advanced considerably. I may mention only a few items; carbolic acid which could be purchased at 13c a pound before August, rose to 36c a pound. The price of salicylic acid and sodium salicylate was nearly doubled. That of eserine salicylate was increased 66 per cent, of hyoscyne hydrobromide 120 per cent, etc. As might be expected, as the war proceeded, the prices of some of these drugs have gradually increased. Thus we find at the present time carbolic acid selling at \$1.25, sodium salicylate at \$3.00 and salicylic acid also at \$3.00 per pound.

You will note that none of these products are protected by letters patent but are preparations which may be made by any one.

In order to give you a fair idea of how backward we are in this country in producing remedial agents I will quote the "New and Non Official Remedies," the splendid compilation issued by the American Medical Association. This book, as its name implies, contains the names and descriptions of the majority of new and non-official agents, particularly those of a synthetic character, which have been found by clinical experiments to give reliable results. Here about 500 products are given of which 259 are produced in the United States, 181 in Germany, 18 in Great Britain, 7 in Switzerland and 6 in France. On looking more closely into the character of the various products we find that the United States leads in the production of digestive

\* Discussions will accompany the papers when they are printed in the Journal, hence omitted from the minutes. By request of the chairman the related paper by Dr. A. R. L. Delme is printed in this issue.

ferments, medicinal foods and organo-therapeutic preparations. Forty-one of the above classes of products are given in the book, and deducting these from the total of 259 preparations made in the United States leaves 218, of which 163 are serum preparations. Deducting the serum preparations we find that only 68, almost entirely synthetic preparations are produced in this country compared with 168 obtained from Germany. In order to get this figure I have deducted from the 181 German preparations 13 serum products of German manufacture.

From these figures you will note that about two and one-half times as many synthetic products are obtained from Germany as are produced in this country. Most of these products which are of established repute and are most valuable and effective remedial agents, are protected by letters patent and are the result of continuous, painstaking research work carried out in the laboratories of the large manufacturing houses of Germany. It is interesting to note that of the 13 synthetic anesthetics given in the "New and Non Official Remedies" only one is produced in the United States and only one in France. The valuable arsenic compounds, the well-known atropine derivatives are not produced in this country at all, but all originated abroad and are covered by letters patent. The same holds good for bromine derivatives, the large number of hypnotics, the formaldehyde derivatives, antipyretics, quinine derivatives, salicylic acid derivatives, etc.

A compilation of the imports and exports of the United States kindly furnished me by the Secretary of Commerce gives the following startling figures. In the year 1913 we imported 8,155,098 lbs. of carbolic acid valued at \$532,211 of which 3,709,294 lbs. valued at \$244,147, or 46 per cent, were imported from Germany. Of the 4,964,367 lbs. of duty-free coal-tar distillate preparations, valued at \$370,293 imported, 91 per cent came from Germany. Of the 69,805,678 gallons of creosote oil valued at \$3,711,340 imported, 34 per cent came from Great Britain. France furnished us with 4,511,229 lbs. casein out of 8,808,891 lbs. imported, or 52 per cent.

Dutiable medicinal preparations were imported at a value of \$2,265,578, 38.5 per cent of these came from Germany, 22.5 per cent from Great Britain and 17.1 per cent from France, while in 1911 we imported medicinal products valued at \$2,145,642 of which 65.5 percent came from Germany, 11.3 per cent from Great Britain and 12.7 per cent from France. The export of medicinal products was almost entirely confined to patent and proprietary medicines valued at \$7,110,493 of which 26 per cent were exported to Great Britain.

There is no reason whatever why such articles as carbolic acid, salicylic acid, salicylates, etc., and in fact, all those chemicals not covered by letters patent should not be manufactured in this country. You may recall that soon after the European war started the price of hydroquinone, so widely used in photography, was advanced from \$1.50 to \$15.00 per pound. This product could no doubt be produced in this country just as cheaply as in Europe. Naturally, at first, a good deal of experimenting would be required to evolve a profitable manufacturing basis.

Most of the imported chemicals are derivatives of coal-tar products. Carbolic acid which is used to such a large extent both for medicinal purposes and for producing explosive could easily be manufactured in this country by fractional distillation of coal-tar, or synthetically by sulphonizing benzene and melting the benzene monosulphonic acid with alkali. I am informed that most of the carbolic acid is now produced by diazotizing aniline and boiling the diazo benzene with water. By rational utilization of the much neglected coal-tar immense quantities of phenol could be produced in the United States. There is no patent in existence covering the conversion

of carbolic acid into salicylic acid by the old but by no means obsolete Kolbe method or by other processes.

Now when we consider that most synthetic products are derivatives of comparatively few fundamental substances which can easily be produced in this country, we are at once convinced that an industry for the manufacture of synthetic remedies can and should be established in the United States. The supply of coal-tar in the United States is more than sufficient to provide for all the crude products required both in the manufacture of medicinal agents and coal-tar dyes. It is estimated that the amount of valuable by-products not at present being utilized in our present coking plants amounts to \$75,000,000 annually.

What becomes of the vast quantities of coal-tar produced in this country? It is partly exported to England and Germany where large distilleries are in operation, partly used for increasing the illuminating power of gas, and, although a small amount is distilled here, the largest quantity is no doubt thrown away. Only recently, after the scarcity of organic remedies became acute and the possibility of producing many of these products in this country became evident, have some coal-tar distilling plants been established in the United States. Naturally we should not expect an industry which has been neglected for half a century or more to be put on a paying basis within a few months. It will require a tremendous amount of research work to find out profitable methods for isolating the various products from coal-tar and converting these into organic remedies. This is very probably the reason why chemical plants in this line have been established only on a comparatively small scale. As a rule the American capitalist does not like to tie up his money for several years. He prefers to get a handsome dividend for his invested money as quickly as possible. Putting up a dollar today and getting two dollars in return tomorrow is apparently the aim of the average capitalist in this country.

Another excuse given by capitalists is the fear that when the war is over, preparations produced in this country will be unable to compete in price with those produced in Europe on account of the low wages paid to workmen, even skilled ones, in European countries. In Germany the average workman receives about 15 marks a week, this is less than \$4 and a skilled laborer can easily be had for 25 marks or about \$6. In other European countries similar conditions prevail. I remember that about 20 years ago when I was manufacturing acetphenetidin in Germany, the finished product stood us about 3.60 marks per kilo or about 38c a pound. This product, I believe is sold today in American markets for about \$4.75 per lb.

So much may be said in regard to the production of chemicals which are not protected by letters patent.

Why is it that this country is so far behind in producing synthetic remedies? This, in my opinion, is due to the small amount of research work done in the laboratories of most of the manufacturing houses.

A research chemist is considered by many manufacturing houses as a non-producing person because he may work for months and even years before he is able to produce anything new and profitable.

But how else could we have any synthetic remedies except by elaborate research work? The physiologic action of only a few of the synthetics was discovered accidentally, acetanilid and sulphonal being examples. Most synthetic remedies were produced on a strictly scientific basis by taking as guides the effect of the comparatively simple fundamental product, the structural formulas of remedial agents of established value, such as alkaloids, etc., and the substances which are formed from them in the organism.

Let us consider, for instance, the various cocaine substitutes. When it was

found that cocaine was methyl-benzoyl-ecgonine and when the structural formula for the latter was established, research chemists undertook to find out which of the three most important groups in the cocaine molecule produced the anesthetic action. These three groups were the complicated piperidine nucleus, the benzoyl group and aryl substituted amino group. Based on the supposed action of complicated piperidine nucleus, substances chemically nearly related to this nucleus were prepared, such as the eucaines and euphthalmine, the latter, however, being not an anesthetic but a mydriatic. When it was found that ecgonine did not produce an anesthetic action unless directly combined with the benzoic acid radical, the research chemists thought that the benzoic acid radical combined with simple groups might also produce an anesthetic action. This hypothesis led to the production of such substances as orthoform, subcutin, propaesin, etc. When it was finally established that a substance which contains several ethyl groups linked in a certain manner has hypnotic properties, and when it was further found that tertiary alcohols exert a still greater hypnotic action, the research chemists considered the aryl substituted amino group as essential for producing anesthesia, and thus the most valuable synthetic anesthetics, novocain, alypin, stovain, etc., were produced.

With the exception of stovain, which is a French preparation, all substitutes for cocaine were produced in Germany, the country in which systematic research work has been carried on for more than half a century. The extent to which research work is carried on in Germany is evident when we are told that in the large manufacturing houses such as Elberfeld Farbenfabriken, the Farbwerke Höchst, the Badische Anilin—and Soda Fabrik about 20 percent of the chemists employed devote themselves entirely to research work. Some of these chemists, who, as may be expected, are thoroughly acquainted with every field of chemistry, devote their time to organic and inorganic synthesis; others are engaged in working out the first steps of the manufacturing process of such substances which have been found to be of approved value. All these chemists devote their entire time to this specific work and are not bothered with analytical work or otherwise.

At the first view it may seem that keeping up a research laboratory is a rather expensive undertaking, especially when we bear in mind that comparatively few really valuable therapeutics are discovered by this large number of chemists. But again it is not the isolation of the final product alone which is done by them, but the intermediate products are also thoroughly examined and protected by letters patent in order to close up any loop-hole in the final application for a patent, and thus prevent competitors from obtaining a product by a process similar to that worked out. This is absolutely necessary in countries which have stricter patent laws than the United States. A great drawback in our patent law is that an application for a patent is not published by the Patent Office prior to the investigation and granting of the patent. If this were done in many cases the issuing of a patent would be prevented by proving that the product to be patented had been isolated many years before the patent was applied for. As the matter stands now the manufacturer is confronted by a granted patent, and when he doubts the validity of the patent, he is compelled to take the matter to court and fight it out, usually at great expense.

In this connection I may mention phenacetin and aspirin. How many million dollars have been spent for these two products which never should have been patented in this country because they were well-known and well-defined substances long before the patent was applied for. In no other country in the world are acetphenetidin and acetyl salicylic acid patented.

It is gratifying to know that many of our large manufacturing houses have established well-equipped research laboratories. However, the work in these laboratories is devoted largely to physiological products rather than to real inor-

ganic or organic research work. The time, without doubt, will come, especially if this terrible war should last for many years, when the American manufacturer of chemicals and therapeutic agents will have to equip research laboratories not alone for the purpose of producing chemicals such as carbolic acid, salicylic acid, etc., which now command exorbitant prices or are almost unobtainable, but at the same time to give more dignity to chemistry in America and to show that the American chemist, given the opportunity, can play his part in the achievements of research chemistry.

Now, many persons familiar with the chemical industry in this country claim that thorough research work cannot be done here because we do not have chemists sufficiently qualified to do this kind of work. This may be true to some extent. For my part I am convinced that there are just as many bright students in this country as on the other side of the big pond. But the students in this country, with few exceptions, make the great mistake in believing that having passed through a college or university successfully, they are through with their studies. It is their aim to leave the college as soon as possible to earn the first dollar. This is why so many young men remain in special branches of manufacturing all their life-time, analyze day in and day out, year in and year out fertilizers, steel, ore, etc., and get acquainted with only those methods and discoveries which pertain to their special work. Such chemists, will, of course, never make research chemists, not even in their special line of work. I have found that, with a few exceptions, only those chemists who after having passed their final examinations have done post-graduate work and have kept up with the progress of chemistry and are desirous to keep up with it all the time, are equipped to do accurate research work.

To some extent the low entrance requirements of most colleges have a great influence on the inability of many students to develop into efficient chemists. It is simply impossible to follow the achievements of chemistry with a knowledge of only one language. Most of the important work in chemistry is published in the German language, a good deal in French, and quite recently in Dutch and Italian. Although our domestic periodicals give very good abstracts, particularly those published by the American Chemical Society, it is in many cases impossible to work according to abstracts and, in order to get the details of the operation, one is compelled to consult the original article.

So much for the production of chemicals and remedies. I wish to call your attention to the existence of a somewhat analogous condition in regard to some medicinal plants, the cost of which advanced to abnormal and almost prohibitive figures immediately after the war began, and which still prevail.

Here again the natural resources of our country such as diversity of climate and soil and the large areas of uncultivated lands make it quite an easy matter to grow certain of the drugs now imported and thus create a profitable industry and at the same time avoid dependence upon European markets for our supplies.

It is a question well worth our consideration, and I present it to you in the hope that the possibilities and difficulties of drug culture may be discussed by those of you better qualified by experience than I am.

In conclusion, it may be said that considering the great natural resources in this country, which so far have been developed only to a limited extent, it is more than possible that a well-paying industry for producing chemicals and therapeutic remedies, including synthetic products could be established if the manufacturers were willing to spend the time and money necessary to do such work. As already stated an industry of this kind cannot be developed from today to tomorrow, a large amount of research work is necessary which naturally cannot give a fair profit to the invested capital in a short time. But one will soon find that many young men having heretofore considered their scientific work as finished when

leaving the university or college, will continue studying the new achievements in chemistry, because they will find out that in order to do extended research work such a course is absolutely necessary; these young men will also find that chemists with a thorough knowledge of all branches of chemistry can at all times command well-paying positions. Once this fact is realized there will be no lack of properly-trained men.

It is, therefore, incumbent upon the two closely related sciences, chemistry and pharmacy, and to the American capitalist to work hand in hand in order to establish an industry which will make us entirely independent of the European markets and which will preclude the possibilities of such conditions as existed after the outbreak of the European war and which still continue.

Such an industry would not only retain in this country much money which now goes abroad, but as already mentioned would place American chemistry and the ingenuity and education of American chemists upon a basis whereby scientific competition with the progressive European chemistry may be established.

#### DISCUSSIONS ON CHAIRMAN'S ADDRESS.

Dr. Turner: I think that Dr. Englehardt's address is a splendid one. He has covered the subject from several points of view and has summarized the condition as it exists today better than I have ever heard it presented anywhere else.

This address may be divided into three parts. The first in relation to the conditions of the chemical industry in this country. The second related to the chemical research laboratories of manufacturing houses which should be in a position to produce such compounds as are necessary for the chemical industries to manufacture. The third part was in relation to the schools, which should produce men who, in turn, should be able to work in these research laboratories.

Speaking relative to the first proposition, the condition of the chemical industry in this country is deplorable. It is due to a great many factors, and particularly I suppose it is due to the question of capital more than anything else. Chemical manufacturing involves a large amount of capital, particularly the organic part. It requires a large amount of capital invested in machinery, apparatus, and so on, as well as in laboratories which are necessary in connection with manufacturing. No capitalist is willing to invest his money unless he sees not only a safe return of his money, but also a future. As the condition exists today, there is absolutely no incentive for any capitalist to invest his money in chemical manufacturing. The conditions as they exist in Germany enable them to dump on this market the over-production, and the over-production enables the German manufacturer to reduce his cost of manufacture, and, through syndicates, maintain a price over there on a sufficiently high level. In order to overcome this condition, it seems to me we should stick closely to the recommendation which was made by the Committee which investigated the possibility of the manufacture of organic products in this country for the General Chemical Company. They made an exhaustive report and went closely into the question not only of various products which could be manufactured profitably in this country, but also in regard to the relation of wages as compared with this country, and so on. They recommended that the chemical manufacture in this country would be possibly under the condition that Congress pass a tariff which would be about 30 percent ad valorem and 7 cents per pound specific in addition. Under those conditions the chemical industry could exist in this country. There would be an incentive for the capitalists to invest their money.

I know from my personal experience that there are many capitalists ready to invest their money today. Even with the high price of benzoyl-ecgonine as it exists, there is sufficient return on the capital and business to enable the manufacturer to recoup himself before the war is terminated.

At the same time, most of these capitalists are very progressive men; they like to build; they don't like to start an industry today and get their money back tomorrow and then close the factory afterwards. They want to see a future for it. And the only way they can see a

future is by the government regulating the tariff in such a way that the production of chemicals in this country will insure to them a return in the future.

I would like to present a resolution from this section to be introduced before the General Session of the American Pharmaceutical Association, recommending that they bring before the proper authorities this view, that is, that Congress be urged to pass a tariff which would be based on those terms, that is, 30 per cent ad valorem and 7 cents per pound specific.

Now, in regard to the second part of Dr. Englehardt's address, that is, in regard to research laboratories, the conditions that exist in this country today, both in chemical and pharmaceutical particulars do not permit of the manufacture or the discovering in research laboratories of the same amount of synthetics as are discovered in Germany.

In the first place, in Germany the medical profession is very willing to co-operate not only with the chemical departments of universities, but with manufacturing houses as well, in investigating in clinics and hospitals the effects of various remedies produced in the laboratories, adopting those that are found good and rejecting those found wanting. It is very easy, and no one looks upon that phase of the question as below the dignity of a professor in a college of medicine; if you approach a man he will be glad to aid in this work of investigation. It is done very easily, and hence, whenever a new remedy is put on the market in Germany it has a great amount of clinical reports behind it.

In this country the manufacturer is compelled to go on the market with secret reports of those physicians who are willing to do the investigation work. It is next to impossible, if not impossible, to obtain any clinical reports which would be published in medical journals and which would be given to the medical profession as impartial evidence of the value of the new remedy.

Another condition which is of great value in Germany is that the college professors, and particularly the professors of chemistry, have a great deal of time to devote to work. Various compounds have been introduced which are the products of their work. It is also true that the manufacturing houses have done very valuable work.

But before we can speak of manufacturing and producing new synthetics, the conditions in this country will have to be changed greatly in the way of affording the college professors more time and enabling the students to devote more time to research. For this reason, I think the laboratories of research houses devote their time to physiological products rather than chemical. They do not require as much time.

But it is undoubtedly possible with the material at hand in this country to do research work. I have known many who received their education in this country who had the same ability as any foreign chemist had for research work.

I believe that is all I have to say on the subject of the President's address.

Dr. Asher: I did not hear the first part of the Chairman's address, but I was impressed with one phase of it that we will have to take up, and at the proper time I think we should pass a resolution.

What has been said regarding our condition is true, but there is one condition with which we are confronted that is more serious than all. That has to do with our patent laws. No matter what we do in this country today, no matter how proficient chemists or physiologists may be, it amounts to nothing unless there is a revision of our patent laws. The patent laws as they exist today are such that they do not offer any inducement for capital to engage in manufacturing.

There is one other point, and I am not saying it in criticism of Dr. Engelhardt's paper, but I want to quote or abstract some remarks made by Dr. Bommerheise at the chemical meeting in New Orleans this last April. A great deal has been said in the newspapers against the American chemist. The chemical industries, the manufacturing people of this country, have looked upon the American chemist as a joke. I don't think that the American chemist is a joke. I have as much regard for the American chemist as I have for any chemist. Conditions are different in this country. There is more inducement for study and research abroad than in this country, but if we study the proposition in its proper light

it all comes down to a commercial basis. Why has not the chemical industry of this country made greater strides? It is because there is no opportunity here. It has been shown that the capitalist can make more money investing it in other channels than investing it in the line of chemical industry. Take the synthetics or the color industry as an example. There are 900 different colors on the market, each factory practically specializing in one particular color, and having an outcome for the by-products which in this country we could not have because most of those are covered by patents. He showed in his report of some of the stores—I will not mention the names—that they are selling more in the line of candy in one year than the profits from the chemical industry of Europe, and all down the line, so that the American capitalist is looking to that end where he will get the best results whether scientific or not. That is the real situation.

We could do more no doubt if our patent law was changed; so if I am in order, I would offer as a resolution, after this discussion is through, that we petition Congress to change the patent laws to afford the American chemist protection such as is afforded in Europe.

Dr. C. E. Caspari: One phase of this which has been touched on but about which something might be said, and that is the coal tar industry.

Dr. Engelhardt has referred to the fact that we send coal tar to Europe and it is shipped back here under different names, a part of it is used for increasing the value of illuminating gas, the light value. But a great percentage of it is used in making roads and roofing. Up to the present time it has been found more profitable to use it that way than to distill it and use the profits. No matter what our facilities in this country are or will be for manufacture, even if protected by a tariff, you cannot create in a year or five years or ten years the coal tar industry of Europe.

The coal tar industry is analogous to the packing house. The packing houses could not exist today if they didn't utilize every particle of a steer or of a hog. Their profits are really in the by-products; they are not in the meat itself. And so it is in the coal tar industry. After we obtain the various raw materials from coal tar by distillation, it then becomes necessary to manufacture these into other products. There will be certain by-products and a use must be found for those by-products to make the entire program profitable. And until we have devoted sufficient time in this country under the most favorable conditions to developing the industry as it has been done in Germany, we will never be able to compete with the German coal tar in this country.

Since the war began the scarcity of carbolic acid has been felt in this country. I know positively that carbolic acid is being made here now in large quantities and can be purchased in drums containing a thousand pounds or more. I know the concern that buys it from Mr. Edison in these quantities. I know that is another instance where because of lack of material coming from Germany a factory was compelled to manufacture its own material. So when the necessity arises I believe we will be able to meet the situation provided we have protection from Congress in the way of tariff.

Mr. Lichthardt: I will discuss another phase of the matter, and that is the production of crude drugs. We in California have been interested in that. Dr. Schneider is the pioneer in that line, and through my connections with the City of Sacramento, I have interested the school department, and they have taken up the propagation of crude drugs in the agricultural department of the city schools. The children are taking up the growing of belladonna, hyoscyamus and other drugs of vegetable origin, and I think that that is a very good way of starting such an industry in the United States. If we could find out just exactly what would grow in our locality, it would help us. I will admit that in the Sacramento Valley everything will grow, but it may not grow as well as it does in other parts of the United States. I haven't any doubt but that we can raise peppermint, and I know I have done some original work on digitalis. Belladonna, I think, would do pretty well there, but, nevertheless, the idea is worthy of being taken up throughout the United States, of trying to get the school children interested. They are willing to raise these drugs. And when they have raised them, let us, who know how to do research work, do it for the good of the community and analyze these drugs and see if they will compare with the European grown.

Dr. Schneider: I don't want to relate my experience in growing plants in California, because it is a very sad one. Some of the difficulties referred to by one or two of the speakers I have encountered also. To find money interests sufficient to start an enterprise of any kind is not an easy matter. In regard to the growing of belladonna, I will second the statement of Mr. Lichthardt of Sacramento that everything grows in California and grows very well. Mr. Lichthardt made the statement that some things grow better in other states. I don't agree with him. Nothing grows better than it does in California, belladonna included! We can grow here belladonna of very superior quality and can grow it profitably if we can use the stems. The manufacturers do use the stems. The content of California grown belladonna stem is equal to the leaf. I will not state my experience as I think I have done so at other meetings, but I will announce for the benefit of those present that I am now preparing a bulletin on the growing of belladonna which will be issued by the University of California Agricultural Department. Keep that in mind, and if you should be interested in growing belladonna, write for that bulletin, which will contain the details regarding the seeding and transplanting and cultivating and alkaloidal content and so forth. Nearly every drug plant, with the exception of purely tropical plants, can be grown profitably in the State of California and in other states, provided enough money is invested, and also provided enough energy is exerted to make the enterprise a success. That is all that is necessary, two things, money and effort. If those are forthcoming, it will be a success. Whether or not the government grants a tariff or a bounty, we know that a number of enterprises have been made a success, including the sugar beet industry of California, through the granting of a bounty. I have that in mind and I think it is an excellent idea. I know of no way to awaken interest better than that. Congress seems to take cognizance of those things of which it wishes to take cognizance, that is all there is to it.

Mr. Newcomb: Does the address contain any resolution?

Mr. Scoville: There have been two recommendations made.

Dr. Englehardt: Neither of them have been seconded.

Mr. Newcomb: Does the address contain any recommendations?

Dr. Englehardt: No.

Dr. Turner: I move the President's address be accepted and take the usual course.

(The motion was seconded, put and carried.)

Dr. Turner: In regard to the resolution, I would like to make it formal, that it be recommended to the House of Delegates and asked to be passed, as follows:

"In order to promote the chemical industry in this country, and particularly the manufacture of synthetic organic compounds necessary for medicinal purposes, a duty should be imposed on all compounds of that nature to the extent of 30 percent ad valorem and 7 cents per pound specific."

(The motion was seconded.)

Dr. Schneider: Mr. Chairman, while we are waiting, I wish to second the resolution which Dr. Asher is preparing now, namely, that our patent laws be properly revised.

Dr. Englehardt: While the resolution is being written down, we want to go ahead with the program, and I wish to appoint a committee to nominate officers for the coming year, and for that purpose I will appoint Dr. Schneider, repre-

sending the West, Dr. Caspari representing the Middle West, and Dr. Koch representing the East.

Is there any miscellaneous business? If not, we will proceed with the reading of the papers.

Dr. Asher: I have the resolution now:

*"Be it Resolved*, That, owing to the existing patent laws entailing a hardship on the chemical industry of this country, the Congress of the United States be requested to change the laws in keeping with those of foreign countries."

Dr. Englehardt: You have heard the resolution. What is your pleasure?

After some discussion, Dr. Turner moved as substitute, that a committee be appointed to look into the question of patent laws in this country as compared with patent laws in other countries, and to have a resolution passed for submission to Congress or to such other authority as may be found necessary.

After further remarks by other members, Mr. C. A. Mayo seconded the motion of Dr. Turner that a committee be appointed by the Section to study the question, and said this, of course, will be a committee of the Section. In the ordinary course, the action taken by the Section would be referred to the General Session, and there would be acted on with the full knowledge of the Committee on Patents and Trademarks.

The question was called for and adopted by vote. After consultation with the members the Chairman appointed a committee of four, consisting of Messrs. F. E. Stewart, Caspari, Asher and Turner.

Dr. Englehardt: Now there is the other motion of Dr. Turner which the Secretary will read.

Mr. Scoville (reading): *"Resolved*, That in order to promote the organic chemical industry in this country, and especially the manufacture of organic synthetic products used in the practice of medicine, a duty should be imposed on all such products, as well as the raw material entering into the composition of such, to the extent of 30 percent ad valorem and 7 cents per pound specific. It is further

*Resolved*, That the Congress of the United States be petitioned to enact legislation to this effect."

Dr. Englehardt: You have heard the resolution. Is there any discussion? (The question on the resolution was put and carried.)

Dr. Englehardt: We will proceed with the reading of the papers. The next paper on the program is a paper by Prof. Scoville on Tinctures.

After discussion the paper was referred for publication.

The other papers read at this session are as follows:

The Increase of Acidity of Hydrogen Peroxide on Standing—By C. F. Ramsey and A. M. Clover.

The Retarding Effect of Certain Substances on Pepsin Digestion—By C. F. Ramsey.

Standardization of Colors—By H. V. Army.

Hydrolysis of Some of the Common Vegetable Oils—By W. F. Rudd.

History of the Discovery of Alkaloidal Affinities of Hydrous Aluminum Silicate—By J. U. Lloyd.

These papers after discussion were referred for publication. The discussions will accompany the papers when printed in the Journal.

Dr. Caspari: Mr. Chairman, this Section will have two more sessions, one tomorrow afternoon and one Thursday morning, and this room is to be used at 5 o'clock by another organization, and it is pretty near that now.

Dr. Englehardt: Then a motion to adjourn is in order. But before we adjourn I would like to ask the Nominating Committee whether they are ready to report.

Dr. Caspari: The Nominating Committee is ready to report. We beg leave to submit the following nominees: For Chairman, W. L. Scoville, H. V. Army; First Vice Chairman, L. A. Brown, C. W. Johnson; Second Vice President, Joseph L. Turner, A. Thurston; Secretary, E. L. Newcomb, William Mansfield.

Dr. Englehardt: Then a motion to adjourn is in order.

(It was moved, seconded and carried that the meeting adjourn.)

(Adjourned.)

---

#### SCIENCE AS A BALANCE WHEEL.

Thinking and doing are for the time out of balance. Science has the power to restore and maintain the balance by breathing more of its spirit into practical life, and if an instrument to guide this work is needed—if it is right for men of science to have a confession of faith—I know of none more inspiring than the words that Huxley used in defining his own life purpose. To promote the increase of natural knowledge and to forward the application of scientific methods of investigation to all the problems of life to the best of my ability, in the conviction which has grown with my growth and strengthened with my strength, that there is no alleviation for the sufferings of mankind except veracity of thought and of action, and the resolute facing of the world as it is when the garment of make-believe by which pious hands have hidden its uglier features is stripped off.—*Ross G. Harrison, Science.*

## REPORT OF COMMITTEE ON UNOFFICIAL STANDARDS.

The following portion of the report of the Committee on Unofficial Standards relates to certain crude drugs and chemicals suggested for inclusion in the next revision of the National Formulary, and by order of the Council is published in the JOURNAL in order to afford opportunity for discussion before the standards proposed are finally adopted.

Manufacturers, importers, analysts, and others interested in any of the proposed standards, are requested to send their criticisms and comments to the chairman of the committee, Geo. M. Beringer, 501 Federal St., Camden, N. J.

## FERRI PYROPHOSPHAS SOLUBILIS

## Soluble Ferric Pyrophosphate

It should contain Ferric Pyrophosphate corresponding in amount to not less than 10 percent of iron ( $\text{Fe}=55.84$ ). It should be kept in amber-colored, well-stoppered bottles, protected from light.

Soluble Ferric Pyrophosphate occurs in thin, apple-green transparent scales, without odor, and having an acidulous, slightly saline taste. The salt is permanent in dry air, when excluded from light, but when unprotected, soon becomes discolored.

Soluble Ferric Pyrophosphate is freely and completely soluble in water, insoluble in alcohol. An aqueous solution of the salt shows a slightly acid reaction with litmus.

Soluble Ferric Pyrophosphate when boiled with potassium hydroxide T. S., should produce a brownish-red precipitate without evolving ammonia.

Fuse 0.1 Gm. of the salt with 0.1 Gm. each of potassium nitrate and sodium carbonate, and boil the residue with 10 mls of distilled water and filter. The filtrate, after being rendered nearly, but not quite, neutral with dilute nitric acid, should yield a yellow precipitate upon the addition of silver nitrate T. S.

Boil 5 mls of an aqueous solution of the Salt (1 in 10) with an excess of potassium hydroxide T. S., until the iron is entirely precipitated and filter; on acidulating the filtrate with acetic acid and adding silver nitrate T. S. the precipitate produced is pure white and not yellow (*Orthophosphate*.)

Assay—Weigh accurately about 1 Gm. of Soluble Ferric Pyrophosphate, dissolve it in 25 mls of distilled water in a glass stoppered bottle, add 15 mls of hydrochloric acid and

2 Gm. of potassium iodide, securely stopper the bottle and keep it at a temperature of  $40^{\circ}$  C. for 30 minutes. When cooled and then titrated with tenth-normal sodium thiosulphate V. S., using starch T. S. as indicator, it should show not less than 10 percent of iron. Each mil of tenth-normal sodium thiosulphate V. S. used corresponds to 0.005584 Gm. of Iron (Fe).

Each gramme of Soluble Ferric Pyrophosphate, U. S. P., corresponds to at least 17.908 mls of tenth-normal sodium thiosulphate V. S.

*Average dose*.—0.25 Gm. (4 grains).

## FICUS

## Fig.

The partially dried fruit of *Ficus Carica* Linné (Fam. *Moraceae*).

Usually compressed, of irregular rounded shapes, 2.5 Cm. to 5 Cm. in diameter, fleshy, light brown to yellow, frequently with an efflorescence of sugar; apex with a small scaly orifice; base with a scar or short stalk; internally hollow, with numerous small, brownish-yellow, glossy and hard akenes; odor distinct, fruity; taste sweet, pleasant.

## GALEGA

Galega. European Goats Rue.

The dried flowering tops of *Galega officinalis* Linné (Fam. *Leguminosae*).

Stem smooth, erect, branched, when entire 15 to 45 cm. long, commonly cut and broken; leaves oddly-pinnate with 6-8 pairs of leaflets; stipule lanceolate, sagitate on one side; leaflets bright green, smooth or slightly hairy, short petioled, lanceolate or ovate-lanceolate, obtuse, slightly mucronate, 2 to 5 cm. long, 2 to 6 mm. broad; flowers small, white

to violet, in axillary racemes. Odor indistinct; taste mucilaginous, slightly bitter and astringent; colors the saliva yellowish-green.

### GERANIUM

Geranium. Cranesbill.

The dried rhizome of *Geranium maculatum* Linné (Fam. *Geraniaceae*.)

Of horizontal growth; cylindraceous, somewhat flattened and rather sharply tuberculated, 2.5 to 10 Cm. long and 3 to 15 Mm. in diameter; longitudinally wrinkled, dark brown; fracture short, light reddish brown or purplish; bark thin; wood indistinct; central pith large; odor slight; taste strongly astringent.

*Average dose*.—1 Gm. (15 grains).

### GOSSYPH CORTEX

Cotton Root Bark.

The recently-gathered dried bark of the root of one or more of the cultivated varieties of *Gossypium herbaceum* Linné, or *Gossypium barbadense* Linné, or *Gossypium arboreum* Linné (Fam. *Malvaceae*) without admixture of more than 5 percent of wood and other foreign material.

In flexible bands or quilled pieces, attaining a length of 30 cm. and a thickness of about 1 mm.; outer surface orange-brown, smooth, slightly wrinkled, with small circular lenticels, the outer corky layer frequently exfoliated and showing the more or less fissured and fibrous middle bark; inner surface light brown, longitudinally striate; fracture tough, fibrous, the inner bark readily separable into fibrous layers; odor slight; taste very slightly acid.

Under the microscope, sections of Cotton Root Bark show an outer layer of cork composed of 4 to 6 layers of tubular thin-walled cells, yellowish-brown, non-lignified cells, a thin primary cortex, consisting of starch-bearing parenchyma and an occasional large secretion reservoir with yellowish-brown contents; inner bark with large groups of bast-fibers arranged in interrupted, successive, concentric circles, separated radially by medullary rays and tangentially by the lenticels or sieve tissue; bast-fibers 0.300 to 1.000 mm. in length, 0.015 mm. in width, the walls being 0.005 mm. in thickness, strongly lignified and with very few pores, the ends being acute and markedly attenuate; medul-

lary rays 1 to 6 cells wide, the cells usually filled with starch grains; in diameter, the latter from 0.003 to 0.020 mm.; occasional cells containing rosette aggregates of calcium oxalate 0.009 to 0.025 mm. in diameter.

*Average dose*.—2 Gm. (30 grains).

### HAEMATOTOXYLON

Haematotoxylon. Logwood

The heart-wood of *Haematotoxylon campachianum* Linné (Fam. *Leguminosae*).

Usually in small chips, reddish-brown, the freshly cut surface dark yellowish-red, on transverse section the wood shows medullary rays which are four cells wide; odor faint, agreeable; taste sweetish, astringent.

Hematotoxylon imparts to water containing a little acid a yellowish color, which is changed to purple or violet-red by alkalis.

When the surface has a greenish, metallic lustre, the wood has undergone fermentation and should be rejected.

### HAMAMELIDIS FOLIA

Hamamelis Leaves. Witchhazel Leaves.

The dried leaves of *Hamamelis virginiana* Linné (Fam. *Hamamelidaceae*), collected in autumn before the flowering of the plants, without admixture of more than 10 percent of stems and other foreign matter.

Petiole 1 to 1.5 cm. in length; lamina, when entire broadly elliptical or rhomboid-ovate, usually inequilateral, mostly 8 to 12 cm. in length; apex usually acute, sometimes rounded or acuminate; base slightly heart-shaped and oblique; margins sinuate or sinuate-dentate; upper surfaces pale or brownish-green, occasionally dark brown, with a few stiff, straight hairs; lower surfaces lighter in color, somewhat hairy, midrib and veins prominent; odor slight; taste astringent, slightly aromatic and bitter.

Under the microscope, sections of Hamamelis leaves show upon the lower surface narrow elliptical stomata, 0.015 mm. in length and with 2 to 4 neighboring cells; from both surfaces, but especially from the under surface, arise stellate hairs composed of 4 to 12 cells united at the base, the individual cells being 0.020 to 0.075 mm. in length, either straight or more or less bent and with very thick walls and narrow lumina, the latter sometimes only apparent in the lower portion of the cells.

Transverse sections show, in addition to the epidermal layers, a palisade layer consisting of a single row of cells and a dorsal pneumatic tissue made up of 3 to 6 rows of strongly branching cells; large collateral fibro-vascular bundles occur in the mid-rib and petiole, the tracheae being narrow, mostly spiral and associated with numerous, narrow, strongly lignified and porous wood-fibers; around the phloem, occurs a nearly continuous circle of bast-fibers, possessing strongly lignified walls; calcium oxalate in monoclinic prisms, 0.010 to 0.035 mm. in diameter, either in the cells of the mesophyll or in crystal-fibers associated with the bast-fibers.

### HELIANTHEMUM

*Helianthemum*

Rock-rose. Frost-weed.

The dried herbage of *Helianthemum Canadense* (Linné) Michaux (Fam. *Cistaceae*.)

Stems mostly less than 5 dm. long, branched above, terete, frequently reddish, canescent, the slender branches mostly erect; leaves very short-petioled, 1 to 3 cm. long, 4 to 8 mm. wide, oblong to oblanceolate, with entire, revolute margins, green and roughish on the upper surface, canescent underneath; flowers of two kinds, rarely present at the same time, early ones mostly solitary, pedicelled, 2 or 3 cm. broad, with bright yellow corolla, hairy calyx, about 30 stamens and a single 3-carpelled pistil, producing an ovoid capsule, about 7 mm. long; later flowers apetalous, clustered in the leaf-axils, nearly sessile, having but 4 stamens and producing a capsule about 4 mm. long; taste lightly aromatic, astrigent and bitter.

### IGNATIA.

*Ignatia*.

Saint Ignatius Bean. *Ignatia amara*.

The dried seed of *Strychnos Ignatii* Bergius (Fam. *Loganiaceae*), yielding, when assayed by the process given below, not less than 2.5 percent of the mixed alkaloids of *Ignatia*. Heavy, hard, angularly ovate with obtuse angles, about 20 to 30 mm. long, by 15 mm. broad and thick; externally grayish or reddish-black and nearly smooth; fracture granular and translucent in small fragments; a small irregular cavity in the center; nearly inodorous; taste intensely bitter.

The yield of ash does not exceed 4 percent.

Assay—To 15 Gm. of *Ignatia*, in No. 60 powder, contained in a 300 mls Erlenmeyer flask, add 150 mls of a mixture of ether two volumes and one volume of chloroform; stopper the flask, shake thoroughly and allow to stand for 10 minutes. Then add 15 mls of ammonia water and 15 mls of distilled water, stopper the flask tightly and shake it vigorously at frequent intervals during 12 hours. Allow the dregs to settle and decant 100 mls of the clear liquid (representing 10 Gm. of the drug). Filter the solution through a pledget of purified cotton into a separator and rinse the graduate with a little ether and pour this through the cotton. Completely extract the alkaloids from the solution by shaking it out repeatedly with successive portions of weak sulphuric acid, (1-20). Collect the acid washings in a second separator, add ammonia water until the solution is decidedly alkaline to litmus and completely extract the alkaloids by shaking out with successive portions of chloroform. Evaporate the combined chloroform washings to dryness, add 5 mls of ether to the residue and again evaporate it to dryness. Dissolve the residue in exactly 10 mls of tenth-normal sulphuric acid, V. S., aided by gently warming, if necessary, and titrate the excess of acid with fiftieth-normal potassium hydroxide V. S., using cochineal T. S. as indicator.

Each milliliter of tenth-normal sulphuric acid V. S. consumed, corresponds to 0.0364 of the total alkaloids of *Ignatia*.

### KAOLINUM

*Kaolin*

A native hydrated aluminum silicate, powdered and freed from gritty particles by elutriation.

A soft, white or yellowish-white powder, or in lumps, having an earthy or clay-like taste; insoluble in water, and in cold dilute acids and solutions of the alkali hydroxides.

When moistened with water, *Kaolin* assumes a darker color and develops a marked clay-like odor.

If 1 Gm. of *Kaolin* be mixed with 10 mls of water and 5 mls of sulphuric acid, no effervescence should occur, and if the mixture be evaporated until the excess of water has been removed, and further heated until dense white fumes of sulphuric acid anhy-

dride appear, then cooled and 20 mls of water added and boiled for a few minutes and filtered, there should remain on the filter a gray insoluble residue of *impure silica*.

If to one-half of the above filtrate ammonia water be added, a gelatinous precipitate of *aluminum hydroxide*, insoluble in excess, should be obtained.

If to the remaining half of this filtrate, sodium hydroxide T. S. be added, it should yield a gelatinous precipitate which is almost or completely soluble in an excess of the reagent.

If 2 Gm. of Kaolin be rubbed in a mortar with 10 mls of water, the mixture should not acquire more than a slight reddish tint on the addition of 0.95 Gm. of sodium salicylate (absence of more than traces of iron).

If Kaolin be ignited at a red heat, it should leave not less than 85 percent of non-volatile residue.

#### KRAMERIA

*Krameria*. Rhatany.

The dried root of *Krameria triandra* Ruiz and Pavon, known in commerce as Peruvian Rhatany, or of *Krameria lina* Linné, known in commerce as Savanilla Rhatany, or *Krameria argentea* Martius, known in commerce as Para or Brazilian Rhatany (Fam. *Leguminosae*), without admixture of more than 5 percent of stems and other foreign matter.

*Peruvian Rhatany*.—It consists of a knotty, several to many-headed crown with numerous branching roots, the latter rarely attaining a length of 50 cm. and usually less than 1 cm. in thickness, cylindrical, somewhat tapering, flexuous or wavy and very flexible, externally light reddish-brown or brownish-red, more or less marked with dark scaly cork, especially in the upper portion, otherwise nearly smooth, somewhat longitudinally wrinkled and devoid of transverse fissures, fracture of bark slightly fibrous, of wood tough and splintery, the pinkish-brown bark less than one-third of the radius, the wood yellowish or pinkish-white and finely radiate; odorless; wood nearly tasteless, bark astringent.

*Savanilla Rhatany and Para Rhatany*.

Roots usually separate, less flexuous and tapering than those of Peruvian Rhatany, and usually not exceeding 12 mm. in thick-

ness; externally purplish-brown or chocolate-brown and marked with numerous fissures; fracture less tough than that of Peruvian Rhatany, internally the bark and wood darker, the bark about two-fifths or more of the radius and more astringent than that of Peruvian Rhatany.

*Powder*.—Reddish-brown; starch grains, single or 2- to 4-compound, the individual grains spherical, ellipsoidal, or plano-convex, and sometimes with a central, radial or star-like cleft, 0.003 to 0.035 mm. in diameter; bast-fibers more or less wavy in outline with very much attenuated ends and with non-lignified walls, tracheae with simple or bordered pores associated with numerous wood fibers which are narrow-spindle shaped and with thick, porous, slightly lignified walls; numerous cellular fragments with yellowish or reddish brown walls; calcium oxalate in monoclinic prisms, 0.010 to 0.100 mm. in length, few or frequently absent.

Macerate 2 Gm. of powdered Rhatany with 10 mls of alcohol, with occasional stirring for one hour and filter. The deep reddish colored filtrate obtained should yield a dark brownish-red precipitate and a deep orange-red filtrate upon the addition of an excess of alcoholic lead acetate T. S.; this latter filtrate should yield no precipitate upon the further addition of a drop or two of alcoholic lead acetate T. S., and should give an olive-brown solution having a purplish fluorescence upon the addition of a drop or two of ferric chloride T. S.

The yield of aqueous extract should be not less than 9 percent.

The yield of ash should not exceed 5 percent.

*Average dose*.—1 Gm. (15 grains).

#### LAPPA

*Lappa*. Burdock Root.

The dried root of *Arctium Lappa* Linné, or of other species of *Arctium* (Fam. *Compositae*), collected from plants of the first year's growth.

Nearly simple, fusiform, of variable length, 5 to 20 Mm. in diameter near the crown; frequently split or in broken pieces; externally grayish-brown, longitudinally wrinkled, the crown somewhat annulate, sometimes surmounted by a woolly tuft of leaf remains; fracture somewhat horny; a dark cambium separating the thick brownish

bark from the yellowish porous and radiate wood, centrally hollow or containing a white pith-like tissue; odor slight; taste mucilaginous, sweetish, and slightly bitter.

*Average dose*.—2 Gm. (30 grains).

### LEPTANDRA

Leptandra. Culver's Root.

The dried rhizome and roots of *Veronica virginica* Linné (Fam. *Scrophulariaceae*) without admixture of more than 5 percent of stems and other foreign matter.

Rhizome usually of horizontal growth, nearly cylindrical, somewhat branched, 4 to 10 cm. in length and 4 to 13 mm. in diameter; branches readily separable from the main rhizome; externally grayish-brown to dark reddish-brown, annulate from circular scars of bud-scales, upper surface with short stem remnants; occasionally with buds, and numerous circular stem-scars; from the under and lateral portions arise numerous coarse roots; fracture very tough and woody; internally bark rather thin, dark brown and resinous, wood about the same thickness as the bark, light brown and porous, pith large, more or less hollow the color being similar to that of the bark; nearly odorless; taste very bitter and acrid.

Roots 1 to 10 cm. in length and 1 to 2 mm. in diameter; externally dark brown to purplish brown, smooth and faintly longitudinally wrinkled; fracture short; internally with a thick brownish-black bark and small light brown central cylinder.

*Powder*.—Dark brown and yellowish-white; odor strong, penetrating; consisting of numerous irregular fragments, many of them being colored pink or violet upon the addition of hydrated chloral T. S.; starch grains numerous, to some extent isolated but mostly in the parenchymatous cells, the individual grains being nearly spherical or more or less polygonal, and from 0.002 to 0.008 mm. in diameter; fragments of woody tissues with tracheae and wood-fibers; tracheae with spiral thickenings or with simple or bordered pores, wood-fibers with thick lignified walls, with simple pores or with bordered pores, resembling tracheids; fragments of parenchyma containing a light brown or brownish-black resin, the latter frequently closely coherent with the starch grains in the cells thus preventing the separation of the individual starch grains; in hydrated chloral

T. S. mounts, occasional elongated cells with a lemon-yellow oily substance.

### LUPULINUM

Lupulin.

The glandular trichomes separated from the strobiles of *Humulus Lupulus* Linne (Fam. *Moraceae*).

A granular powder, bright yellowish-brown having the characteristic odor and taste of hops; on aging, becoming darker in color, disagreeable and valerian-like in odor, when it is unfit for use. Lupulin should be kept in tightly-closed containers protected from light.

Under the microscope, the glandular trichomes are somewhat globular or ellipsoidal, 0.150 to 0.200 mm. in diameter, consisting of a single layer of secreting cells assuming the form of a shallow cup, from the inner surface of which the cuticle has been separated by the secreted yellowish-brown oleo-resin.

Not less than 60 per cent of Lupulin should be soluble in ether.

The yield of ash should not exceed 16 percent.

### MANGANI ET SODII CITRAS

Manganese and Sodium Citrate

Soluble Manganese Citrate.

Manganous citrate made soluble by sodium citrate. It contains, when rendered anhydrous by drying at 120° C. to constant weight, from 49 to 51 percent of manganous citrate.  $[Mn_2(C_6H_5O_7)_2 = 542.87.]$

Manganese and Sodium Citrate occurs as a yellowish or pinkish white powder, or as translucent scales; odorless; having a slightly bitter and astringent taste. Permanent in the air.

It is slowly soluble in about four parts of water, slightly more soluble in boiling water, nearly insoluble in alcohol.

An aqueous solution of the salt is neutral or slightly alkaline to litmus, but does not redden phenolphthalein T. S.

When strongly heated, the salt chars and finally leaves a residue which effervesces with acids and imparts an intensely yellow color to a non-luminous flame.

An aqueous solution of the salt (1-20) made alkaline with ammonia water yields on warming with ammonium sulphide T. S., a salmon colored precipitate.

Ten mils of the aqueous solution of the

salt (1-20), slightly acidulated with acetic acid and mixed with 2 mls of calcium chloride T. S., remains clear while cold, but yields a white crystalline precipitate when heated to boiling.

Ten mls of the aqueous solution of the salt (1-50) does not respond to the U. S. P. test for *heavy metals*.

Separate portions of 10 mls each of an aqueous solution (1-100) answer the following requirements: Acidulated with hydrochloric acid it is not more than slightly reddened by potassium sulphocyanate T. S. (*iron*); nor rendered turbid at once by barium chloride T. S. (*sulphate*); nor show more than an opalescence with silver nitrate T. S. when acidulated with nitric acid (*chloride*).

Mix about 0.5 gm. of the salt with 5 mls. of sulphuric acid in a porcelain dish previously rinsed with sulphuric acid, protect the mixture from dust, and heat it for 15 minutes on a waterbath. No color darker than yellow develops (*Tartrates or other readily carbonizable substances*).

Assay—Weigh accurately about 0.5 gm. of the salt, previously dried to constant weight at 120° C., dissolve it in 100 mls of distilled water, add 50 mls of hydrogen dioxide solution, and 10 mls of ammonia water, and boil the mixture for several minutes. Collect the precipitate on a filter, wash it thoroughly with hot distilled water, dry and ignite to constant weight. The weight of the manganous-manganic oxide ( $Mn_2O_3$ ) thus obtained, is not less than 20.65, nor more than 21.1 percent of the weight of the salt taken, corresponding to not less than 49, nor more than 51 percent of manganous citrate.

## MANGANESE HYPOPHOSPHITE.

### Manganese Hypophosphite.

It should contain not less than 97 percent of hydrated manganese hypophosphate [ $Mn(Ph_2O)_2 \cdot H_2O$ , 203.06]. It should be kept in well-stoppered vials.

Manganese Hypophosphite is a pink, granular or crystalline powder, odorless, and nearly tasteless, permanent in the air.

It is freely soluble in water; insoluble in alcohol.

An aqueous solution of the salt (1 in 20) shows a neutral or acid reaction with litmus, and yields with ammonium sulphide T. S. a

salmon-colored precipitate of manganese sulphide, soluble in acetic acid.

When strongly heated in a dry test-tube, the salt evolves spontaneously inflammable hydrogen phosphide and on complete ignition leaves a residue of manganous pyrophosphate.

When an aqueous solution of the salt (1 in 20) acidulated with hydrochloric acid is added drop by drop with agitation to an excess of mercuric chloride T. S., a white precipitate of mercurous chloride is formed, and, upon the further addition of the solution of Manganese Hypophosphite, the precipitate becomes gray from reduction to metallic mercury.

On adding about 0.5 gm. of the salt to 5 mls of acetic acid it should produce no effervescence (*carbonate*).

On boiling 0.25 gm. of the salt with 10 mls of potassium hydroxide T. S. it will produce a light salmon-colored precipitate which gradually acquires a brown color on exposure to the air. The filtrate from this mixture, after being slightly acidulated with hydrochloric acid and boiling for a minute and then rendered alkaline with ammonia water, should yield no precipitate upon the addition of magnesia mixture T. S. (*phosphate*).

Dissolve 1 gm. of the salt in 20 mls of diluted hydrochloric acid with the aid of heat and then add 1 ml of barium chloride T. S. Not more than a slight turbidity should be produced (*sulphate*).

Dissolve 0.5 gm. of Manganese Hypophosphite in 10 mls of hot distilled water, add 10 mls of solution of hydrogen dioxide and 10 mls of potassium hydroxide T. S., boil for a minute, then make slightly acid with acetic acid and again warm. Cool, filter, and to 10 mls of the filtrate add 1 ml of ammonium oxalate T. S. No turbidity should be produced within five minutes (*calcium*).

Pour 5 mls of an aqueous solution of the salt (1 in 30) into an evaporating dish containing 3 mls of nitric acid, dilute with about 10 mls of distilled water and evaporate to dryness on a water-bath. The residue should not respond to the U. S. P. test for *arsenic*.

Assay—Weigh accurately about 1 gm. of Manganese Hypophosphite, and dissolve it in 20 mls of boiling distilled water in a 250 ml graduated flask. Add 25 mls of solution of hydrogen dioxide and 15 mls of potassium hydroxide T. S. and heat for ten minute on a water-bath with frequent agitation. Cool,

add distilled water to make the volume exactly 250 mls, mix well and filter through a dry filter. Evaporate 25 mls of the clear filtrate to dryness with 10 mls of nitric acid, dissolve the residue in 10 mls of distilled water, transfer it to a 100 ml flask with the aid of a few mls of distilled water, add a drop of phenolphthalein T. S. and sufficient potassium hydroxide T. S. (free from chloride) to produce a pink color, then add 50 mls of tenth-normal silver nitrate V. S. and proceed from this point as directed in the assay under *Sodii Phosphas*, U. S. P.

When calculated to the amount originally taken it should show not less than 97 percent of Manganese Hypophosphite.

Each milliliter of tenth-normal silver nitrate V. S. used, corresponds to 0.003384 gm. of hydrated Manganese Hypophosphite  $Mn(PH_2O_2)_2 \cdot H_2O$ .

Each gramme of Manganese Hypophosphite corresponds to at least 286.64 milliliters of tenth-normal silver nitrate V. S.

### MASTICHE

#### Mastic

A concrete resinous exudation from *Pistacia Lentiscus* Linne (Fam. *Anacardiaceae*).

In subglobular, lenticular, elongated or pear-shaped tears, about 3 mm. in diameter, pale yellow or greenish-yellow, transparent, having a glass-like lustre, the surface sometimes very slightly dusty; brittle, becoming

plastic when chewed; odor slight, balsamic; taste mild, terebinthinate.

Mastic is completely soluble in ether and almost completely soluble in alcohol. The acid number determined by the method of the U. S. P. should not be less than 65.

### MELILOTUS

#### Melilot. Yellow Sweet Clover

The dried leaves and flowering tops of *Melilotus officinalis* (Linne) Lamarck (Fam. *Papilionaceae*).

Stems mostly less than 3 dm. long, slender, straight, mostly simple, often leafy below, terminating in long, slender racemes, the younger portions very finely pubescent; leaves glabrous or nearly so, petiolate, trifoliolate, stipulate, the stipules subulate, entire, the leaflets 1 to 3 cm. long, varying from narrowly oblong to oval or occasionally broader above the middle, rounded truncate or slightly notched at the summit, sharply serrate; racemes 1 dm. or less long, many flowered; the flowers yellow, 5 or 6 mm. long, calyx bell-shaped, the 5 nearly equal lobes shorter than the tube, corolla papilionaceous, the keel shorter than the other petals, which are about equal; legumes reflexed, about 4 mm. long, obovate, wrinkled, 1-seeded; odor strong, vanilla like; taste sweetish, peculiar, slightly pungent and bitter.

The yield of ash should not exceed 10 percent.

The most important agricultural fertilizer—sodium nitrate—has been obtained for a great many years from the nitrate beds in Chile. These beds are now almost exhausted, and for a time persons interested in agriculture felt considerable anxiety about the future supply of this fertilizer. It has long been known that the electric arc burning in a mixture of nitrogen and oxygen such as we find in the case of air, will cause the two gases to unite chemically. The heat of the arc, however, is so great as to cause the two gases to separate again. It was found later that if the distance between the carbons of the arc is increased and the arc drawn aside and attenuated by means of a magnet, the gases will not be separated after combination. This discovery was followed in several countries of Europe, notably Sweden, Norway, Italy, and others where there is good water power, by the establishment of great plants for the manufacture of commercial fertilizers from the air. It has doubtless occurred to many persons that this abstraction of nitrogen might ultimately render the air unfit for breathing. The worry on this account, however, may be dismissed when we learn that the air above each square mile of the earth's surface contains nearly 24 million tons of nitrogen.—*Ambition*.

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished reprints by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

- 100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.
- 200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.
- 50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.
- 100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.
- 200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.
- 50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.
- 100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.
- 200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

### THE FILLING OF AMPOULES.

Herbert Skinner, in the *Pharmaceutical Journal and Pharmacist*, describes his method for filling ampoules, which may be adopted in any pharmacy.

The ampoules are boiled in distilled water twice, of course using fresh water each time. He suggests that a supply of ampoules after the second boiling should

be kept filled with distilled water, ready for an emergency order. The apparatus for filling is constructed as follows: No. 1, an Erlenmeyer flask of 125 mls is fitted with a rubber stopper, having two perforations; through one is inserted an ordinary glass cannula, through the other is passed a piece of glass tubing to the bottom of the flask and projecting about one inch above the stopper. A piece of thick-walled rubber tubing is slipped over the end. Attached to the cannula is a single bulb bellows, of which the valve end has been blocked to prevent ingress of air. The whole is fixed on a retort stand over a spirit lamp. This serves for filling Ophthalmic ampoules.

For the bottle style, replace the small piece of thick-walled rubber tubing by a piece about seven inches long, and in the end insert a piece of nickel tube, two inches long, with a bore about that of an ordinary exploring needle. In filling, the ampoule mouth is inserted over the nickel piece and pulled over, so that the rubber tubing forms a half circle; pressure is applied to the bulb; then with the left hand withdraw the ampoule and release the pressure with the right. This will clear the mouth of the ampoule and enables sealing to be done without risk of fracture to the neck.

A second piece of apparatus is described for removing traces of water and consists of a single bellows bulb with the end blocked as before and a nickel piece fitted into the tube, which is attached horizontally to the upright of the retort stand; the mouth of the ampoule is pushed over the nickel tube and sufficient pressure exerted on the bellows to blow out the water.

After sealing, the ampoules should be ster-

ilized for half an hour at 80° C. Mr. Skinner states that for this purpose they use a wire basket which replaces the dish in the water-bath, a cover is placed over it to keep in the steam. Sterilization will soon show whether the ampoules have been properly sealed or not.

Mr. Skinner concludes by saying that he has tried many methods, automatic and otherwise, but this system is preferred by him.

<>

#### WHAT IS A DRACHM?

We are glad to publish the following comment by Mr. M. I. Wilbert on the editorial under above caption in the August issue.

Our intention was not to do Dr. Alsberg an injustice, but simply followed the lines of the paper presented at the meeting of the Pennsylvania Pharmaceutical Association. We were not aware that manufacturers had made use of a term, practically obsolete, in order to create an impression of greater weight. We still contend that it is an easy matter to do away with several of the values given to the term referred to. We maintain that it would be advantageous to have only one "dram" and that the value of it be sixty grains, to be designated as the English translation of the Latin, drachma.

We thank Mr. Wilbert for his communication, which follows:

"I had intended to call your attention before to the editorial in the August number of the *Journal of the American Pharmaceutical Association*, headed, 'What is a Drachm?' As I read this editorial it is not quite fair to the Chief of the Bureau of Chemistry. It would appear to intimate that the promulgation of the ruling that a dram is to be considered as the sixteenth part of an avoirdupois ounce is an arbitrary decision on the part of Dr. Alsberg, the Chief of the Bureau of Chemistry, whereas in fact it is nothing more than a recognition of existing law and the legality of practices that are admittedly designed to mislead. Unfortunately, perhaps, the weights and measures amendment to the Food and Drugs Act specifies that the weight of an article must be given in avoirdupois pounds or fractions thereof, or in the metric system. Now it appears that many years ago, when the avoirdupois pound was recognized by law as the official standard, the recognition involved all of the fractions of the pound then in use in England. The avoirdupois dram never even excited academic interest in this country until after the adoption of the weights and measures amendment to the Food and Drugs Act, when some clever or well-posted manufacturer discov-

ered that seven drams would look infinitely more impressive than one-half ounce. This practice was early adopted by several manufacturers and when investigated by the Bureau of Chemistry it was found that the people using the word "dram" has ample authority at law for doing so and the ruling referred to was published primarily as a warning or as information that the practice of misleading purchasers by the use of the word "dram" was spreading rather rapidly. The only thing that pharmacists can do and should do is to differentiate between the Pharmacopoeial or apothecaries' "drachm" and the avoirdupois "dram" so as to establish the difference between them. Further than this you may be interested in the fact that this controversy over dram and drachm is developing an interest in the metric system and some manufacturers, at least, have adopted the metric system for stating the weight of materials contained in a given package.

M. I. WILBERT."

#### COLOR VARIATION AND PRECIPITATION IN TINCTURE OF NUX VOMICA SOMETIMES DUE TO AMMONIA.

Thomas Latham has communicated the following:

F. W. Nitardy in July issue of the *Journal of the A. Ph. A.*, mentions variation of color in tincture of nux vomica from a rich brown made with U. S. P. extract, to straw color when made by diluting fluidextract.

The most recent powdered extract does not give a rich brown but a color nearly that which Mr. Nitardy takes exceptions to. Improvement in vacuum apparatus has enabled manufacturers to produce a light gray extract, whereas formerly it was a coffee brown. The caramelization would naturally reduce the alkaloid content and be a financial loss, as it is necessary to bring the extract up to U. S. P. strychnine standard. Observing precipitation in a batch of tincture made with the newer extract, I conferred with the manufacturer whose chemist suggested that it was due to the ammonia present in the air of the filtering room and that the addition of nitrohydrochloric acid would re-dissolve the precipitate. This accidental contamination doubtless lead Kennedy (*American Journal of Pharmacy*) to conclude that ammonia was found in the tincture per se as he found strychnine in the precipitate. I have found 1 to 500 of the acid sufficient to clear the tincture, when a slight precipitate is found upon standing two or three weeks.

## DR. PAUL EHRLICH.

The rank of Dr. Paul Ehrlich will be undisputed by physicians and the laity, and pharmacy willingly accords him honor for establishing chemotherapy.

The side chain theory offers an explanation of the chemical production of antitoxins, and hence the phenomena of immunity to disease.

Ehrlich discovered the parasite "spirochaete pallida" while experimenting with dyestuff on the different tissues of the body and after many failures, indicated by the number given to Salvarsan, found the specific which, even without his many other discoveries, entitles him to highest distinction.

Dr. Ehrlich died August 20 at the age of sixty; as we count time, a comparatively short life, but in achievement and usefulness his months had the value of years. E. G. E.

## DR. CHARLES J. FINLAY.

Pharmacy honors the memory of Dr. Charles J. Finlay, and the United States and the world have profited, in conservation of life and time, by values that cannot be estimated. Others of course contributed by sacrifice and application to the potential discovery of the transmission of yellow fever, but the demonstration of Dr. Findlay's theory vanquished the "terror of the tropics" and connected the "great oceans."

Dr. Finlay, aged 81, accompanied Dr. Ehrlich, August 20, to the place of rest, from where we hope they may observe the results of their labors and fortunate discoveries and be gratified by the world's beneficial application of them. E. G. E.

## Necrology

## JOHN ROEMER.

John Roemer, President of the New York Branch of the American Pharmaceutical Association, was born in New York in 1873 and died in the White Plains Hospital, White Plains, N. Y., on August 20, 1915, following an operation for gall-stones.

Mr. Roemer received his early education in the public schools of New York and was graduated from the New York College of Pharmacy on reaching his majority. After taking a post graduate course in Columbia

University, he engaged in the practice of pharmacy in New York for six years. He then removed to White Plains where he soon established an enviable reputation for the excellence of his prescription work.

The nostrum had no place on his shelves. It was largely through his activity, and that of his friend, John McCullough, of White Plains, that the Westchester County Pharmaceutical Association became one of the strongest of local organizations. Mr. Roemer was elected president of this organization and was thereafter re-elected for three terms. He became particularly interested in propaganda work for ethical pharmacy, and was made Chairman of the Propaganda Committee of the New York State Pharmaceutical Association, serving as such until one year ago.

He became a member of the American Pharmaceutical Association in 1910, and in 1914 he was elected to the presidency of the New York Branch of the American Pharmaceutical Association. He became widely known as a staunch advocate of ethical pharmacy, and there was scarcely any line of pharmaceutical activity with which he has not been identified during the past score of years. It is stated of him that "Many of the theories and policies which Mr. Roemer advocated several years ago have since been followed with incalculable benefit to the profession at large. Of poetic mien and a constant theorizer, he had his practical side, and most of his suggestions and recommendations for the good of pharmacy had a sound foundation on common sense and practicability."

Mr. Roemer had strong civic pride. He was prominent in the politics of his city and county. He was a member of the Board of Water Commissioners of White Plains. He was a charter member of White Plains Council, Royal Arcanum, and an active member of the Business and Professional Men's Association of White Plains. He was also a member of the Faculty of the Jersey City College of Pharmacy. Although never elected to office in the national pharmaceutical organization he served on a number of committees.

Among his contributions to the literature of pharmacy which he furnished in recent years may be mentioned a paper which was published in the August (1915) issue of the "Journal of the American Pharmaceutical Association" entitled "The Science of Phe-

nomena," read before the New York Branch. In this article, he advanced a new theory of pharmacodynamics, which related to the science of phenomena, as applied to drugs, basing the action of such on the energy within the atoms and molecules, which through the electro-motive forces of the body in reaction, is transformed into kinetic energy, resulting in the phenomena of drug action.

Among his other recent contributions were: "Non-Official Medicaments" (Journal A. Ph. A., 1914, 259), "Pharmacy of Oxy-cholesterin" (Jour. A. Ph. A., 1913, 9), and "Uniformity in Drug Standards and Uniform Requirements in Dispensing" (Jour. A. Ph. A., 1913, 625). The Journal is in receipt from him of a paper on "Solutions" written only one week before his death, which is published in this issue.

The funeral services of Mr. Roemer were held at his late residence on August 22, 1915.

He is survived by his wife, who was Miss Eve Haffner and two daughters, Gertrude and Maxine.

J. W. E.

### JAMES O'HARE.

Dr. James O'Hare, whose death occurred recently, was one of the leading pharmacists of Rhode Island. He was born in Providence and received his schooling in that city. His apprenticeship was served with H. I. Leith and he entered business as a proprietor at the junction of Benefit and North Main Streets. A few years ago he added another store, also on North Main Street, and his ability as a business man was well displayed in the success of these stores.

Dr. O'Hare was a member of the Rhode Island Pharmaceutical Association, of which he was President, in 1891 and 1892, of the American Pharmaceutical Association, the N. A. R. D., the New England Branch of the American Pharmaceutical Association, and of the Rhode Island State Board of Health. He was the organizer of the Buying Club, known as the Providence Wholesale Drug Company. In all these organizations he was an active and progressive member, occupying positions of trust and responsibility.

There has been no pharmaceutical legislation enacted in the last twenty years in Rhode Island without Dr. O'Hare's active participation. He possessed, to use a colloquialism, "a nose" for legislation in any way adverse to pharmaceutical interests, and

many bills, through his efforts, have either died in committee or been greatly modified before passage.

He was the author of the Rhode Island Poison Law, the Rhode Island Food and Drug Law, which at the time of its passage was pronounced the best in the country, and of the Educational Requirement Act. The latter was the first of its kind in the country, and requires a college of pharmacy education of all who contemplate having a drug business of their own. He was the most active worker in securing the charter for the Rhode Island College of Pharmacy, and in the work attending its establishment and maintenance up to the present time. He was its president, and the teaching force and student body alike keenly feel his loss.

In recognition of his professional ability, the Board of Trustees of the College in 1912 conferred upon him the honorary degree of Doctor of Pharmacy.

The review of his work as a business man, or as a professional man, reveals always the scientific man, and in this State he stood in the forefront of his calling.

J. W. E.

## The Bulletin Board

### OFFICERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION FOR 1915-1916.

The officers of the American Pharmaceutical Association for the ensuing year are: President, W. C. Alpers, of Cleveland, Ohio; Vice-Presidents, C. H. LaWall, of Philadelphia, Pa.; E. A. Ruddiman, of Nashville, Tenn., and Linwood A. Brown, of Lexington, Ky.; members of the Council, Caswell A. Mayo, of New York; F. M. Apple, of Philadelphia, Pa., and H. V. Army, of New York.

The officers of the Council are: Honorary President, F. C. Godbold, of New Orleans, La.; General Secretary, W. B. Day, of Chicago, Ills.; Editor, E. G. Eberle, of Dallas, Texas; Treasurer, H. M. Whelpley, of St. Louis, Mo., and Reporter on the Progress of Pharmacy, J. A. Koch, of Pittsburg, Pa.

House of Delegates: Chairman, H. P. Hynson, of Baltimore, Md.; Vice-chairmen,

F. W. Nitardy, of Denver, Colo.; Dr. O. F. Claus, of St. Louis, Mo.; Secretary, Jeannot Hostmann, of New York.

The various sections elected the following officers: Commercial Interests—Chairman, R. S. Lehmann, of New York; Associates, E. H. Thiesing, of Cincinnati, Ohio; W. H. Cousins, of Dallas, Texas, and G. H. P. Lichthardt, of Sacramento, Cal.; Secretary, J. C. McGee, of Jackson, Miss.

Scientific—Chairman, W. L. Seoville, of Detroit; Vice-chairman, L. A. Brown, of Lexington, Ky., and J. L. Turner, of Brooklyn, N. Y.; Secretary, E. L. Newcomb, of Minneapolis, Minn.

Education and Legislation—Chairman, F. H. Freericks, of Cincinnati, Ohio; Associates, Louis Emanuel, of Pittsburgh, Pa.; Miss Zada Cooper, Iowa City, and C. H. Packard, of Boston, Mass.; Secretary, R. A. Kuever, of Iowa City, Iowa.

Practical Pharmacy and Dispensing—Chairman, Joseph Weinstein, of New York; Secretary, Lee Secheverell, of Denver, Colo.; Associate, Franz Berg, of Colorado Springs, Colo.

Historical Pharmacy—Chairman, Charles Holzhauser, of Newark, N. J.; Secretary, G. G. Marshall, of Cleveland, Ohio; Historian, E. G. Eberle, of Dallas, Texas.

Woman's Section—President, Mrs. G. D. Timmons, of Valparaiso, Ind.; Honorary President, Mrs. F. C. Godbold, of New Orleans, La.; Vice-president, Mrs. W. B.

Philips, of Fruitvale, Cal.; Mrs. E. A. Ruddiman, of Nashville, Tenn., and Miss Jean Gordon, of Chicago, Ills.; Secretary, Miss Anna G. Bagley, of Columbus, Ohio; Treasurer, Mrs. W. B. Day, of Chicago, Ills.; Historian, Miss Bertha Ott, of Cincinnati, Ohio; Member of Executive Committee, Miss Clarissa M. Roehr, of San Francisco, Cal.

The nominees for the several elective offices follow and these names are to be submitted for vote by mail:

For President—F. J. Wulling, of Minneapolis, Minn.; C. H. La Wall, of Philadelphia, Pa., and C. H. Packard, of Boston, Mass.

For First Vice-president—L. A. Seltzer, of Detroit, Mich.; A. B. Husted, of Albany, N. Y., and C. W. Johnson, of Seattle, Wash.

For Second Vice-president, Charles Geitner, of St. Louis, Mo.; L. E. Sayre, of Lawrence, Kans., and G. H. P. Lichthardt, of Sacramento, Cal.

For Third Vice-president, F. T. Green, of San Francisco, Cal., R. A. Lyman, of Lincoln, Neb., and Philip Asher, of New Orleans, La.

For Members of the Council, W. C. Alpers, of Cleveland, Ohio, J. H. Beal, of Urbana, Ills., W. C. Anderson, of Brooklyn, N. Y.; Jose M. Diaz, of Havana, Cuba; W. H. Cousins, of Dallas, Texas; J. H. Dawson, of San Francisco, Cal.; F. C. Godbold, of New Orleans, La.; H. B. Mason, of Detroit, Mich., and W. G. Bolenbaugh, of Richmond, Va.

#### THOSE WHO REGISTERED AT THE CONVENTION OF THE AMERICAN PHARMACEUTICAL ASSOCIATION IN SAN FRANCISCO.

## Societies

### PROGRAM OF THE FORTY-FIRST CONVENTION OF THE N. W. D. A.

At Los Angeles, Wednesday, September 22. Members arrive at the headquarters in the Hotel Alexandria.

Thursday, September 23—Garden party tendered to the members by L. N. Brunswig, at his home, from 4 to 6 p. m.

Sunday, September 26—Members depart for Santa Barbara. Arrive at Santa Barbara at noon, Sunday, September 26.

Monday, September 27—Ten a. m., first business session; 2 p. m., second business session; 2 p. m., two-hour auto ride for ladies to the Old Mission and mountain drive to Montecito Valley; 9 p. m., president's reception and ball.

Tuesday, September 28—Ten a. m., third business session; 2 p. m., fourth business session; 2 p. m., auto ride for ladies to Old Mission Hope Ranch; tea at Potter Country Club; 8:30 p. m., informal meeting of wholesale druggists; 8:30 p. m., informal dance.

Wednesday, September 29—Ten a. m., fifth session; 2 p. m., informal meeting of wholesale druggists; 2 p. m., auto ride to Hope Ranch, Country Club, Cliff Drive, Mission,

Mountain Drive and Montecito Valley; 8:30 p. m., informal dance.

Thursday, September 30—Ten a. m., sixth session; 12 m., auto ride and barbecue at Hope Ranch Park, participated in by entire attendance; 4 p. m., informal meeting of wholesale druggists; 7:30 p. m., banquet.

Friday, October 1—Depart for San Francisco.

The Committee on Arrangements and Entertainment, of which C. F. Michaels, Vice-president of the Langley & Michaels Company, of San Francisco, is chairman, announces that all indications point to a large attendance.

&lt;&gt;

#### NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

It is expected that President Wilson will be present at the opening exercises of the National Exposition of Chemical Industries, September 20. This event will mark an epoch in the history of American chemical industries. Elaborate exhibits, showing processes and apparatus in actual work, have been provided. Part of the program for the week, following the opening day, are as follows:

Tuesday, September 21—Paper by R. S. Frinck, President Frinck Pyrometer Company, on "The Relation of Chemistry and Mechanical Manipulation to the Evolution of the Glass Industry."

Wednesday, September 22—"Foreign Markets for American Chemicals," by Thomas H. Norton, of United States Department of Commerce. "Accident Prevention in the Chemical Industries," by F. W. Keough, President of National Association of Manufacturers. "Transportation and Shipping Facilities with Foreign Countries," by Welding Ring, President American Exporters' Association. "The Aniline Dye Situation," by L. F. Stone, President National Aniline and Chemical Company.

Thursday, September 23—"Potash," by H. A. Huston, of German Kali Works.

Friday, September 24—"American Contributions to Industrial Chemistry," by S. P. Sadtler, of S. P. Sadtler & Sons. "Chemical Industry," by L. H. Backlund.

A motion picture program has been arranged by the Bureau of Commercial Economics at Washington. Many of the exhibitors will also have speakers in the auditorium, who will lecture and display by

motion and slide pictures the work of their respective companies. This lecture and picture program will be announced from day to day on the exposition bulletin boards.

Under the auspices of the Bureau of Foreign and Domestic Commerce, some eight bureaus in the Department of Commerce, Interior and Agriculture are now arranging noteworthy and instructive exhibits, each of which will be typical and demonstrative of the work of that bureau.

&lt;&gt;

#### THE NATIONAL ASSOCIATION OF RETAIL DRUGGISTS.

The National Association of Retail Druggists convened in Minneapolis during the week of August 30. The attendance was good and the meeting successful.

Before the annual session President Samuel C. Henry, a lineal descendant of Patrick Henry, was presented with a gavel carved from the wood of a tree on the Henry lands in Virginia.

In his address Mr. Henry advocated uniformity in state laws, advised amendment of the patent laws and suggested a few changes in the Harrison law.

The Chicago Retail Druggists Association through representative John J. Boehm, presented resolutions requesting Congress to place the war tax where it belongs, on manufacturers of war material. That export duties should be imposed on drugs and chemicals sent out of the country.

Chairman Charles H. Hulm in a report suggested that stamp taxation should be so applied that the consumer would pay the tax.

The legislative committee report praised the Harrison law, but recommended minor changes in its application to proprietary medicines; condemned the over-taxing of druggists and the practice of boards of health in usurping powers which the law did not intend for them; urged reform of patent laws and upheld uniform price measures.

It was proposed that the sale of alcoholic liquors should come under the Harrison law

M. A. STOUT,  
Bluffton, Ind.,  
President  
N. A. R. D.

and be controlled by somewhat similar regulations. The Association favored the re-introduction of whiskey and brandy in the Pharmacopeia, desiring that these be only sold or dispensed by pharmacists as drugs. Dispensing by physicians was criticized; drug culture, so far as practical, encouraged.

Congressman George R. Smith advocated the passage of the Stevens price maintenance bill but stated that before such a measure can be passed, the public must be educated to understand the benefits of such regulation. J. Leyden White opposed the maintenance of a lobby in Washington, contending that this invited hurtful criticism from opponents of the bill.

#### OFFICERS FOR 1915-1916.

The officers elected for the ensuing year are: President, M. A. Stout, Bluffton, Ind.; First Vice-president, Sol, Eckstein, Milwaukee; Second Vice-president, W. H. Cousins, Dallas; Third Vice-president, L. T. Dunning, Sioux Falls, S. D.; Secretary, Thomas Potts, Chicago; Treasurer, Grant Stevens, Detroit; members chosen for a three-year term on the Executive Committee: Charles H. Huhn, Minneapolis, and Charles Harding, of Cincinnati.

#### THE WOMEN'S ORGANIZATION N. A. R. D.

The Women's Organization of the National Association of Retail Druggists elected Mrs. F. E. McBride, of Youngstown, Ohio, President; Mrs. Nellie F. Lee, of Philadelphia, Secretary; Mrs. John G. Otis, of Cincinnati, Treasurer; Mrs. J. F. Waterhouse, of Boston, to preside over the Executive Committee.

The meeting place for next year's convention is left with the Executive Committee.

A man went into a druggist's shop and asked for something to cure a headache. The druggist held a bottle of hartshorn to his nose and he was nearly overpowered by its pungency.

As soon as he recovered he began to rail at the druggist and threatened to punch his head.

"But didn't it ease your headache?" asked the apothecary.

"Ease my headache!" gasped the man. "I haven't got any headache. It's my wife that's got the headache."—London Times.

## Council Business

#### COUNCIL MEMBERS—1915-1916.

Alpers, Wm. C., 14th St. and Central Ave., Cleveland, Ohio.

Apple, Franklin M., 31st and Berks Sts., Philadelphia, Pa.

Army, H. V., 115 W. 68th St., New York, N. Y.

Beringer, George M., 5th and Federal Sts., Camden, N. J.

Brown, Linwood A., 425 Transylvania Park, Lexington, Ky.

Caspari, Charles, Jr., University of Maryland, Baltimore, Md.

Caspari, Charles E., 2108 Locust St., St. Louis, Mo.

Claus, Otto F., 3513 Herbert St., St. Louis, Mo.

Day, William B., 74 E. 12th St., Chicago, Ill.

Eberle, Eugene G., P. O. Box 1539, Dallas, Texas.

England, Joseph W., 415 N. 33rd St., Philadelphia, Pa.

Fennel, C. T. P., 614 W. Court St., Cincinnati, Ohio.

Freericks, Frank H., 1215 Mercantile Library Bldg., Cincinnati, Ohio.

Godding, J. G., 278 Dartmouth St., Boston, Mass.

Godbold, F. C., 5601 Rosemary Place, New Orleans, La.

Hall, W. A., 200 Griswold, St., Detroit, Mich.

Hensel, Samuel T., 351 Mercantile Bldg., Denver, Col.

Hilton, S. L., 1033 22nd St., N. W., Washington, D. C.

Holzhauser, Charles, 53 Spruce St., Newark, N. J.

Hopp, Lewis C., 1104 Euclid Ave., Cleveland, Ohio.

Hynson, H. P., 423 N. Charles St., Baltimore, Md.

Koch, J. A., Pittsburgh College of Pharmacy, Pittsburgh, Pa.

Kauffman, George B., Front and Chestnut Sts., Columbus, Ohio.

LaPierre, E. H., 80 River St., Cambridge, Mass.

LaWall, Charles H., 39 S. 10th St., Philadelphia, Pa.

Lehman, Robert S., 375 3rd Ave., New York, N. Y.

Mayo, Caswell A., 66 W. Broadway, New York, N. Y.

White, William R., 311 Grace St., Nashville, Tenn.

Wilbert, M. L., 1621 25th St., N. W., Washington, D. C.

Walling, F. J., University of Minnesota, Minneapolis, Minn.

## Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,  
From 2342 Albion Place, St. Louis, Mo.  
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or *type-written*.

ECHOLS, G. J.,  
From 308 W. Main St., Richmond Va.  
To residence unknown.

TANNEY, L.,  
From Ft. Wm. McKinley, P. I.  
To residence unknown.

McEWEN, IRVING,  
From 511 S. 35th St., Omaha, Neb.  
To 509 S. 35th St., Omaha, Neb.

Brown, A. E.,  
From Ft. McDowell, Cal.  
To Ft. Caswell, N. C.

LEAVITT, A. J.,  
From 590 N. Raymond Ave., Pasadena, Cal.  
To 900 N. Lake Ave., Pasadena, Cal.

ELLSBERG, LOUIS A.,  
From 5035 Washington Blvd., Chicago, Ill.  
To 2157 W. North Ave.

## FOREIGN FORMULARIES.

Owing to the numerous inquiries where the foreign formularies mentioned in the article, "Sub-nure Formulas for Specialties," in the August number of *The Journal*, can be obtained, Prof. Otto Raubenheimer asks us to state that book dealers in general can supply same. As they have to be imported he recommends G. F. STECHERT & CO., 151-155 W. 25th St., NEW YORK CITY, a firm which makes a specialty of importing books.

FABIUS CHAPMAN GODBOLD

Honorary President of American Pharmaceutical Association  
1915-1916

FABIUS CHAPMAN GODBOLD

# The Journal of the American Pharmaceutical Association

Volume IV

OCTOBER, 1915

No. 10

Office of Publication, 63 Clinton Building, Columbus, Ohio.

Subscription, \$4.00 per annum, within the United States. To Canada, \$4.35. To other foreign countries in Postal Union, \$4.50 per annum. Single copies, 35 cents.

Entered at the Postoffice at Columbus, Ohio, as Second-Class matter.

Papers and communications for insertion in the JOURNAL should be sent to the Editor, E. G. Eberle, 63 Clinton Bldg., Columbus, Ohio. Subscriptions should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

The Association does not accept the responsibility for the opinions of contributors. Offensive personalities must be avoided.

## **F. C. Godbold, Honorary President American Pharmaceutical Association 1915-1916**

The subject of this brief sketch, Fabius Chapman Godbold, was born in Franklin County, Mississippi, July 7, 1842, and here he grew to manhood. Mr. Godbold served for four years in the Confederate Army and after the close of the war made New Orleans his home, engaging in the drug business in 1866 and continued actively therein in that city until 1913, when he retired.

A few years more and the half century mark of service in pharmacy would have been reached and in that period Mr. Godbold encouraged every movement that contributed for its advancement in the State of his adoption. It was largely through his efforts that the Louisiana Pharmacy Law was enacted and he was honored by appointment when the first Pharmacy Board under its provisions was created, serving as secretary for twenty-one years. He is a charter member and Ex-President of the Louisiana Pharmaceutical Association.

When the National Association of Boards of Pharmacy was organized, he at once took active part in the work and in 1906 at the meeting in Indianapolis was chosen President. He has also taken an active interest in the National Association of Retail Druggists, contributing his efforts and encouragement.

He joined the American Pharmaceutical Association in 1887 and until a few years ago Mr. and Mrs. Godbold were regular attendants at the annual conventions. Mr. Godbold has served the Association in various capacities, holding the Chairmanship of the Council, 1909-1910. The honor which has now been conferred, that of Honorary President of the American Pharmaceutical Association, comes to him as a reward of long and faithful service in the Association and for its advancement.

REPORT OF THE COMMISSION ON PROPRIETARY MEDICINES OF  
THE AMERICAN PHARMACEUTICAL ASSOCIATION.\*

The duties assigned to the Commission on Proprietary Medicines of the American Pharmaceutical Association are:

(1) "To inquire into and to report to the Council from time to time upon the general subject of proprietary medicines in their relations to pharmacy, medicine and the public health.

(2) "To inquire whether, or to what extent, the proprietary medicines commonly known as patent medicines, contain alcohol or habit-forming narcotic drugs in sufficient proportions to render them liable to create an alcohol or drug habit, or satisfy such habits when otherwise created.

(3) "To inquire whether, or to what extent, the commonly advertised patent medicines contain potent drugs in sufficient proportion to render them dangerous in the hands of the laity.

(4) "To inquire into the extent to which patent medicines are fraudulently advertised, or differ in composition or origin from the claims made for them, or the extent to which they are advertised for the use of diseases for which no cure is known to medical science."

The scope of the functions above imposed is sufficiently comprehensive to include practically every phase of the proprietary medicine question which the Commission may choose to consider, and since the number of proprietary medicines on sale in the United States is estimated at 40,000 to 50,000 items, (inclusive of the large number used by the medical profession, but exclusive of the thousands of druggists' "own make" preparations, usually of only local reputation) it will be seen that the task assigned to the Commission is by no means a trivial one.

While the literature relating to proprietary medicines is of enormous volume,—if much of the printed matter relating to this subject can be dignified by the name of literature—a very large proportion of it is of so controversial a character that it may be dismissed at once as of little value, consisting in large part of sweeping general assertions against or in favor of proprietary medicines, the sifting of which results in a vast amount of chaff and very little wheat.

The policy of the American Pharmaceutical Association has always been distinctly unfavorable to the increased use of proprietary medicines, including both those supplied for the use of the medical profession and those intended for direct sale to the general public, and long before the American Medical Association began its active campaign against them the former association had repeatedly placed itself on record in opposition to the multiplication of ready-made medicinal agents, for the reason, aside from other considerations, that the use of such forms of medication has a tendency to reduce the dispensing pharmacist from the

\* Presented to the Council of the A. Ph. A. at the 63d annual convention of the Association, San Francisco, August 9-11, 1915.

rank of a compounder of drugs and medicines to that of a mere dealer in the merchandise of other manufacturers.

Not only does the use of proprietary medicines tend to reduce the legitimate compounding profits of the pharmacist when they are dispensed by him on the order of the physician, but the readiness with which such medicines lend themselves to dispensing by physicians, and the avidity with which physicians have availed themselves of this quality have combined to relieve the retail pharmacist of a great deal of dispensing business, though in theory he is the legalized distributor of medicinal agents.

In the case of the proprietary medicines which are advertised and sold directly to the general public, the situation as it affects the retail pharmacist, is equally unsatisfactory. Even when the advertised prices are obtained the retailer's profit on such articles is only moderate, and when they are sold at cut prices, as is frequently the case, the percentage of profit is usually less than the net percentage cost of doing business.

While the American Pharmaceutical Association has never formally recognized the right of proprietorship in medicinal agents, the American Medical Association, on the other hand, has yielded to the necessities of the situation, and through the action of its Council on Pharmacy and Chemistry has placed the stamp of legitimacy upon numerous patented or protected chemicals, or other articles of proprietary origin. In granting such recognition, however, certain conditions and regulations are imposed which tend to effectually guard the financial and professional interests of the medical profession, and which brand with professional disapproval all proprietary remedies likely to reach the hands of the laity otherwise than through the physician or on his prescription.

Among the most useful of these regulations of the Council on Pharmacy and Chemistry are:

Rule 3, which prohibits the recognition of any medicinal agent that is advertised directly to the general public. Only insecticides, germicides, disinfectants, and non-medicinal foods are excepted from this rule, and these are excepted only when they are not advertised as curative agents.

Rule 4, which prohibits the recognition of any article whose label, package, or accompanying circulars contain the names of the diseases for the treatment of which the article is said to be indicated.

(This rule does not apply to remedies with which self medication is obviously improbable, such as vaccines and antitoxins, nor to cases where similar immediate heroic treatment is indicated.)

Rule 8, which excludes from recognition all articles whose names are suggestive of the diseases or pathological conditions for which they may be used, or which are suggestive of therapeutic indications.

Since without direct advertising (prohibited by Rule 3) the general public would not learn of the existence of proprietary remedies, and would not be likely to purchase them without information as to the affections for which they are intended, (the giving of which information is prohibited by Rules 4 and 8) it follows that if these rules could be given the force of law and universally enforced, the sale and use of proprietary medicines, except under the direction of qualified physicians, would be reduced to a negligible quantity.

While these rules are admirably adapted to conserve the financial and professional interests of the physician, their application to remedies intended for sale to the general public could hardly operate otherwise than to still further contract the small volume of business left to the pharmacist by the dispensing physician.

Druggists' own make preparations and those produced by cooperative companies are clearly within the category of proprietary medicines if they are recommended to the laity for self-medication, and hence must be subject to the same rules regulating advertising and labeling. If the right to bring ready-made remedies to public attention and to state on the labels and wrappers what they are to be used for be denied, the sales of such articles would soon decline to the vanishing point. Whether in such case physicians would enthusiastically begin the writing of prescriptions is a question which one druggist should be able to answer as well as another. The risk is with the druggist, and it is not surprising that he should hesitate to approve a step which would mean a certain reduction of income on the chance of an uncertain gain from another source.

Unfortunately the problems involved in the use of proprietary medicines, especially those known as patent medicines, have too frequently been discussed from a purely partisan standpoint, and in a manner better calculated to cloud judgment than to illuminate it.

1. Too many inconsistent and self-contradictory arguments have been presented in behalf of the same proposition. For example, thousands of analyses have been published tending to show that proprietary medicines are not the result of great and wonderful discoveries made by their manufacturers, but that, on the contrary, they are in many cases combinations of well known and commonly used drugs, recognized by the medical profession as valuable remedies when properly applied. This is a good argument to explode the fanciful claims frequently made for proprietary medicines, but it has been largely nullified by sweeping general statements to the effect that all proprietary medicines are dangerous or worthless, which immediately prompts their defenders to inquire why they should be considered dangerous and worthless if they are practically the same as the combinations used by physicians, and why a given mixture should be considered a valuable and efficient remedy when dispensed by or on the order of a physician, and dangerous and worthless when put up in a carton with printed label and wrapper.

The net result of such contradictory arguments is only to weaken the faith of the public in the efficiency of medicines in general, and to have the impression that proprietary remedies are at least as good as any others, since none of them amounts to very much.

2. While condemning proprietary remedies which are widely advertised, and have a general sale, pharmacists have not hesitated to recommend their "own make" preparations of similar character in their place, from which the customer is likely to infer that the opposition to the advertised remedy is prompted mainly by the fact that it does not return as good a profit as the home compounded mixture.

The argument that the own make preparation is non-secret, has but little weight with the average layman. He reasons that all he wants to know is what the mixture is good for, and that his information will not be advanced by a statement of

ingredients of whose separate qualities and medicinal value he knows little or nothing.

3. While declaiming against proprietary medicines as a class, pharmacists have not hesitated to continue to stock and sell them, or to recommend them by the recital of cases where they have been used with apparent benefit.

In this respect the physician has been as inconsistent as the pharmacist. Thousands of registered physicians are also the owners of drug stores, but we have yet to learn of a physician druggist,—though there may be such—who does not carry a full line of popular patent medicines for sale to all who ask for them; nor would it be difficult to show that many physicians have used and continue to use such remedies in their private practice.

4. In most of these discussions only minor emphasis has been placed upon the fact that the greatest evil of the patent medicine industry is the falsity and extravagance with which its products have been exploited. This is the basic evil of the patent medicine business and the point where it is most vulnerable, and an attack upon this evil needs no argument for its justification.

Numerous patent medicines are mixtures which have some merit if properly applied in cases for which they are adapted; the evil is not in the remedies themselves but in the method of their exploitation. Sweeping general assertions of the absolute worthlessness of patent medicines, besides being untrue, have a contrary effect to the one intended, as for example, the following, attributed to a prominent antagonist of proprietary medicines, "Every advertised cure for disease is a fraud. Its vendor is a quack; his publisher an accomplice; his patron a dupe. One rule covers the field, if it's medical it's a fake," "An honest and meritorious medicine could not live," "A real cure couldn't make office rent," etc. Most people have used patent medicines sometime in their lives, and when they read such statements as the above are inclined to suspect that the whole campaign against ready-made remedies is insincere and prompted largely if not wholly by selfish motives.

#### DEFINITIONS FOR PROPRIETARY MEDICINES, ETC.

One of the first tasks attempted by the Commission was the adoption of a set of general definitions to serve as a basis for its deliberations, and this has proved to be by no means as easy and simple as it might appear.

The definitions finally decided upon, though formulated only after considerable thought and consultation of authorities, are not assumed to be perfect, and suggestions for their further improvement will be welcomed.

*Proprietary Medicine*—A judicial definition of proprietary medicine found in the case of *State vs. Donaldson*, (41 Minn., 80-83) is as follows:

"It is a matter of common knowledge that what are called 'patent' or 'proprietary' medicines are prepared for immediate use by the public, put up in packages or bottles, labeled with the name and accompanied by wrappers containing directions for their use, and the conditions for which they are specifics. In this condition they are distributed over the country in large quantities and sold to consumers in original packages, just as they are purchased by the dealer, without any other or further preparation or compounding."

It is evident from the language employed that the learned judge had in mind only the class of preparations commonly known as "patent medicines," and the definition therefore is properly applicable only to that class of proprietaries.

The definition adopted by the Council on Pharmacy and Chemistry of the American Medical Association, reported in *New and Nonofficial Remedies*, is as follows:

"The term 'proprietary article,' in this place shall mean any chemical, drug or similar preparation used in the treatment of disease, if such article is protected against free competition, as to name, product, composition or process of manufacture by secrecy, patent, copyright, or in any other manner."

The latter definition possesses the advantage of compactness, with substantial accuracy, but does not set forth the factors of proprietorship with sufficient detail to meet all of the requirements of the Commission.

The essential feature of proprietorship is the special ownership claimed or assumed by the manufacturer of the exclusive right to manufacture and sell the mixture, or the exclusive right to the use of the name or title under which it is sold, and this is the feature which the Commission has sought to emphasize in the following definition:

"In its widest sense, a proprietary medicine is any drug, chemical or preparation, whether simple or compound, intended or recommended for the cure, treatment or prevention of disease, either of man or of lower animals, the exclusive right to the manufacture of which is assumed or claimed by some particular firm or individual, or which is protected against free competition as to name, character of product, composition or process of manufacture by secrecy, patent, copyright, trade-mark, or in any other manner."

*Classification of Proprietary Medicines*—The most obvious classification of proprietary medicines is, of course, into ethical preparations, or those which are advertised only to the medical profession, and non-ethical or patent medicines, or those which are either advertised directly to the general public, or named or advertised in such a way that in course of time the public will become acquainted with their properties, and thus be lead to purchase them direct, without the advice of a physician.

While it is simple enough to make a distinction between the two classes on paper, it is much less simple to make a practical application of the distinction.

While in theory physicians prescribe and use only those of the first class, as a matter of fact they frequently prescribe and perhaps still more frequently use those of the second class, though usually with the precaution of removing the label, or transferring the medicine to another package so that its proprietary character is not recognizable.

Bearing upon the difficulty of distinguishing between ethical and non-ethical preparations is the following extract from an editorial in the *Journal of the American Medical Association*, (Vol. 64, p. 530):

"When the Council on Pharmacy and Chemistry was started we announced that we did not see any clear line of demarcation between 'patent medicines' and many so-called 'ethical proprietaries.' Time has not caused us to change our opinion."

To the same effect is the following extract from a letter by the Editor of the *Journal of the American Medical Association* to the Chairman of the Commission, which is quoted by permission:

"A 'proprietary' medicine is one that is owned and controlled by some individual, corporation or company. The name itself defines it. There is no difference between a 'proprietary' and a 'patent' medicine. The latter is a misnomer, but is generally applied to proprietary medicines that are advertised directly to the public. These are about the views expressed in *The Journal* on many and various occasions. At the very beginning of our propaganda work, some nine years ago, I brought out this point, and it raised a howl among the 'ethical' proprietary manufacturers. But as time has gone on I believe that the average doctor has begun to realize the same thing. Listerine used to be advertised in medical journals only; it was then an 'ethical' proprietary. Now it is advertised in lay publications; hence it is a 'patent' medicine. But I do not think it is any more a patent medicine now than it was ten years ago; or that it was any more an 'ethical' proprietary ten years ago than it is to-day. So also with Antikamnia."

The distinction then between ethical and non-ethical proprietaries is not in the character of their composition, but in the manner of their exploitation. An otherwise ethical preparation exploited in a non-ethical way thereby becomes non-ethical, and this regardless of its composition or usefulness. Secrecy, while an element, is not the only element in determining the non-ethical character of a preparation, because not even the open publication of the formula will save it from being classed as non-ethical, if exploited to the general public, or if exploited in a non-ethical manner.

As stated by Editor Simmons in the letter above quoted, the term patent medicine is a "misnomer." It was applied originally to remedies protected by letters patent and sold in packages of distinctive form and size. Later the custom of taking out patents upon medicinal mixtures ceased, but the custom of selling them in packages of distinctive form and size continued, and so they have continued to bear the same designation as formerly. The term is now wholly inappropriate, but is apparently so firmly fixed in usage that it seems likely to persist as long as the class of remedies to which it is habitually applied continues in existence.

The distinction between the two classes of proprietaries finally approved by the Commission is expressed in the following definitions:

*Proprietary Medicines Exploited in Accordance with the Requirements of Medical Ethics, or so-called "Ethical Proprietaries"*: Proprietary medicines, the active ingredients of which, with their proportions, are stated on the label or otherwise published, and which are not advertised to the general public, either through the public press, by accompanying circulars or in any other manner, and not accompanied by printed matter calculated to encourage their use by the laity without the advice of a physician.

*"Proprietary Remedies Advertised Directly to the Public," or so-called "Patent Medicines"*: Proprietary medicines, whether of secret or open formula, which are advertised directly to the general public through newspapers, by circulars or in any other manner, and the packages of which are accompanied by printed matter specifying the affections, symptoms, or purposes for which the remedies are recommended, and directions for their use.\*

\*The terms "ethical" and "non-ethical" as employed in this report are intended merely to distinguish between remedies exploited in accordance with the rules of medical ethics regarding the advertising of medicinal agents, and those advertised to the general public in contravention of such rules. The terms have been used for want of better, and are not to be understood as implying any idea of relative merit.

*Patented Medicines*—While it is no longer customary to grant patents upon preparations which are mere mixtures of known remedial agents, it is still the custom to grant patents upon newly discovered chemical compounds which have an alleged use in medicine, and these derivatives of the tar barrel, or “German synthetics,” are among the most commonly used medicinal agents employed by the medical profession.

In order to distinguish these really patented products from the unpatented “patent medicines,” the following definition has been adopted:

*“Patented Medicine”*: Any proprietary medicine protected by an unexpired patent issued by the Government of the United States or by the government of any foreign country.

*Drug Habit and Habit-Forming Drugs*—One of the duties imposed upon the Commission is to determine to what extent “the proprietary medicines commonly known as patent medicines contain alcohol or habit-forming narcotic drugs in sufficient amount to render them liable to create an alcohol or drug habit, or to satisfy such habits when otherwise created,” which necessitates a clear understanding of the terms drug habit and habit-forming drugs.

While these terms are fairly well understood by medical authorities, attempts are sometimes made to stretch their application to an unwarranted extent. Some would class as a drug habit the taking of the same remedy for a recurrent ailment, although the drug was not used between the successive recurrences, and although there was no increase in the dosage required for relief. As one such correspondent puts it, “if a man in a malaria country takes quinine every time he has ‘the shakes,’ he has a drug habit, and quinine is the habit-forming drug.”

Such definitions are, of course, mere verbal plays upon the terms habit and habit-forming, and are not worthy of serious consideration.

If we examine a typical case of drug habituation we shall find certain elements constantly present:

1. Increased tolerance for the drug, so that doses can be safely taken that would have produced serious or even fatal results if taken before habituation was established.

2. The continuance of the drug after the occasion for which it was originally used has passed, for the sake of obtaining the physiological effects of the drug alone, or of avoiding the effects which would result from its discontinuance.

3. The sudden discontinuance of the drug produces a marked sense of discomfort, and may occasion serious functional disturbance.

After consultation of various authorities, the Commission has decided upon the following definitions:

*“Drug Habit”*: An acquired tolerance for quantities of a drug in excess of the normal, safe dose, and a craving or appetite which can be satisfied only by the continued use of such drug, or of some other drug of equivalent or similar physiological properties.

*“Habit-Forming Drug”*: Any drug or mixture the continued use of which leads to the toleration of quantities greatly in excess of the normal, safe dose, or to a constitutional craving or need for the drug, the sudden discontinuance of which occasions a marked sense of discomfort, and may cause serious or well-marked functional disturbance.

## THE BRITISH PARLIAMENTARY COMMITTEE REPORT.

In 1914 there appeared the Report of the Select Committee of the House of Commons which had been directed to make a general inquiry into the trade in patent and proprietary medicines as conducted in Great Britain. The inquiry extended through three sessions of Parliament, during which thirty-three public sittings were held, 42 expert witnesses were examined, and more than 14,000 questions were propounded.

Nine of the witnesses were representatives of Government Departments, eleven were medical practitioners, five were public analysts, four were wholesale or manufacturing druggists, and nine were the manufacturers of proprietary medicinal preparations.

The printed report presents the conclusions of what was probably the most extended and complete investigation of the proprietary medicine industry ever made under official supervision.

While the report is entirely too long for presentation at this place, a brief synopsis of its principal features may be of interest.

The report presents a review of the laws of Great Britain and her colonial possessions, from which it would seem that in Great Britain there is much less control of the sale of fraudulent and dangerous medicines than is exercised in the United States through the operation of the Federal Food and Drugs Act, and of similar acts in most of the states.

*Analyses of Secret Remedies*—The difficulty of making accurate analyses of remedies containing vegetable extractives is considered and the conclusion reached that complete identification of the ingredients of a complex mixture may be impossible when drugs are used which do not contain constituents of well-marked chemical characteristics, and that of a mixture of vegetable extracts the maker "can truthfully say that the composition of his remedy cannot be discovered by analysis," and also that mixtures of "tinctures, infusions, decoctions, extracts, etc., may defy all chemical, microscopic, spectroscopic, olfactory or physiological analysis. While a mixture, therefore, may have a therapeutical value, it may also be made to defy the analytical exposure of a fraudulent claim of therapeutical value."

*Classification of Proprietaries*—In the language of the Report: "Patent and proprietary medicines differ very widely in character. At one end of the scale is the valuable scientific preparation; at the other end is the mere vulgar swindle. Any useful consideration of them must therefore be preceded by some classification into distinct categories, as these may call for widely differing treatment in the public interest, corresponding to their differences of character."

Non-secret proprietaries are divided into the three following groups:

1. "Genuine drugs originally produced synthetically, or extracted from crude compounds by skilled chemists and tested by therapeutists," the processes of manufacture of which are patented or the names of which are registered as trade-marks, represented by such examples as aspirin, adrenalin, and urotropin.

2. Remedies "that contain no new drugs, but are only new combinations, depending for their potable or assimilable qualities upon the skill with which they

are compounded," as "various emulsions of cod-liver oil or petroleum, and mixtures of bismuth with pepsin."

3. Non-secret drugs with secret excipients, or "known drugs with formula disclosed, mixed for purposes of convenient or elegant manufacture with minute quantities of medically inert substances, the nature of which is a trade secret."

Concerning the above three groups the report states: "It will be evident that unless some of the above drugs are such as should not be sold at all; unless it should be thought desirable to forbid unfounded claims of efficacy in curing disease; or unless any restriction of the multiplication of trade names be recommended, there is nothing in the above Class calling for interference in the public interest."

*Secret Remedies*—Secret remedies are classified under four groups which may be summarized as follows:

(1) "Household Remedies," often originally manufactured from a doctor's family prescription, and undoubtedly beneficial for uncomplicated ailments, \* \* \* Except for the fact that often the advertisements of them recommend their use for cases they cannot benefit, thus causing the purchaser to run the risk of serious injury by delay in securing proper medical treatment, there is little or nothing to criticize in their sale."

(2) "Dangerous remedies and drugs for improper purposes," "which should not be sold at all, or which should be sold only on a doctor's prescription, or which should not be sold for the purpose for which they are offered."

(3) "Fraudulent remedies," "consisting of abortifacients, of alleged cures for cancer, consumption, diabetes, paralysis, locomotor ataxia, Bright's disease, lupus, fits, epilepsy, rupture (without operation or appliance), deafness, disease of the eye, syphilis, etc., together with electric belts, apparatus for supplying oxygen to the system, (other than by inspiration), 'ionized' waters," and the like. "There should be little difficulty in identifying remedies of this class, and their treatment in the public interest need involve no doubt or hesitation. They are, and are known by their makers to be, cruel frauds; and the sale and advertisement of them should be prohibited under drastic penalties."

(4) "Genuine simple remedies" which possess real therapeutic value, but "depending for their sale largely or wholly upon the extravagant promises they hold out to the purchaser," including such as "under the name of misbranding," are "now prohibited by law in the United States," and such as are "refused admission into Australia."

Concerning the latter the Report says: "This group presents obviously great difficulties in drawing the line between claims which are merely 'puffs' and claims which are fraudulent, but we regard it as beyond question that the public is defrauded on a large scale by promises which cannot possibly be fulfilled."

The report submits examples of questionable secret remedies and of the exaggerated and fraudulent claims made for them, and of "fake prescription proprietaries" under coined names especially designed to "deceive the public into the belief that they are not proprietary articles, but are familiar drugs, purchasable in small quantities at ordinary prices."

Examples of British nostrums of this class are "pure colorless kalamax," "salith leaves," "stallax," "pilenta soap," "jettaline," "allacite of orange blossom," "tennaline," "carmarole," etc.

*The Trade in Abortifacients*—Judging from the space devoted to the subject, abortifacients or alleged abortifacients are more numerous and are advertised and sold more openly in the United Kingdom than in the United States.

From the report it appears that these abortifacients are not commonly sold in the form of recognized proprietary medicines, but it is said that "simple aperient pills from reputable makers are frequently recommended in language suggesting that they are efficacious for this purpose," as, for example, the recommendation that "women suffering from any 'unusual delay' take 5 pills a day."

*The Medical Profession and Secret Remedies*—The Committee states that "so far as we have been able to discover, no scientific chemist and no qualified medical man, with rare exceptions, is connected with or employed in the manufacture of secret remedies such as those we have placed in Class B," (secret remedies) which is certainly contrary to experience in America, where a considerable number of medical frauds have been exploited by persons regularly licensed to practice medicine.

The report admits, however, "that many medical men give testimonials (with the use of their medical qualifications but without the use of their names) to proprietary and secret remedies."

*The Publication of Formulae*—Perhaps the most unexpected feature of the report is the position which the Committee takes with regard to the publication of the formulae of proprietary remedies. Considering that the personnel of the Committee was one which suggested the probability of a report unfavorable to the proprietary medicine business in general, and that the majority of the witnesses examined were those whose official positions or personal interests might prompt them to oppose the sale of secret medicines, it was anticipated that one of the recommendations of the Committee would be an unqualified pronouncement in favor of compelling the publication of formulae of proprietary remedies. The conclusions of the Committee, are, however, quite the reverse, as will appear from the following:

"It has been strongly urged upon us, chiefly by witnesses representing the medical profession, that every remedy sold should by law be compelled to bear a label stating its exact composition. This is what is meant by 'exhibition of formula,' and witnesses advocating it came to us convinced that this simple change in the law would secure adequate protection of the public against injury and fraud."

"We have given long and careful consideration to this proposal, and we find ourselves unable to recommend it. In the first place it would beyond question inflict a grave hardship, sometimes amounting to ruin, upon proprietors of secret remedies, or the loss of their investments upon shareholders in limited companies. Any long established remedy in the lawful advertising and sale of which very large sums have been spent, would immediately be faced upon the market by a score of preparations advertised as made from the same formula and sold at a much lower price. An example was given to us of a remedy the proprietary rights of which were immediately destroyed by disclosure of its formula.

"The above would not, we are aware, be a conclusive argument against this pro-

posal if its adoption would really protect the public against danger and fraud. We are convinced, however, that such would not be the case. Any benefit resulting from exhibition of formula must obviously depend for its efficacy upon the intelligence and education of the intending purchaser. It could not in any other way afford protection to the purchaser or restrict the operations of the vendor, though incidentally it would enable a retail chemist to offer the same drug or mixture made up by himself, at a lower price. But to a large majority of purchasers a statement of composition or contents on the label would afford no information whatever. The disclosure that a remedy contains or consists of 'acetyl-salicylic acid,' or 'hexamethylene-tetramine,' or 'phenolphthalein,' or 'taka-dias-tase,' or 'emplastrum plumbi,' or even 'acetanilide,' or 'potassium iodide,' would be meaningless to most people; indeed, the simplest substances might acquire distinction from being described in technical chemical language—soap, for instance, a large ingredient of the most popular aperient pills, posing as 'sodium oleate and stearate.' And if it be rejoined that the popular name should be required to be given, the answer is obvious that many of the most important drugs, such as most of those mentioned above, have no popular name. Further, an accurate statement of contents might be in itself misleading. For example, if 'Phosferine' were stated to contain phosphoric acid, almost every purchaser would believe that he was getting assimilable phosphorus."

"For these reasons exhibition of formula (except in the case of alcohol, poisons, and certain dangerous drugs) does not appear to us to be a proper, practical or effective measure."

*Recommendations*—The principal points of the final recommendations of the Parliamentary Committee are as follows:

"That the administration of the law governing the advertisement and sale of patent, secret and proprietary medicines and appliances be coördinated and combined under the authority of one Department of State."

"That there be established at the Department concerned a register of manufacturers, proprietors and importers of patent, secret and proprietary remedies, and that every such person be required to apply for a certificate of registration and to furnish (*a*) the principal address of the responsible manufacturer or representative in this country, and (*b*) a list of the medicine or medicines proposed to be made or imported."

"That an exact and complete statement of the ingredients and the proportions of the same of every patent, secret and proprietary remedy; of the contents other than wine, and the alcoholic strength of every medicated wine, and a full statement of the therapeutic claims made or to be made; and a specimen of every appliance for the cure of ailments other than recognized surgical appliances, to be furnished to this Department, such information not to be disclosed except as hereinafter recommended, the Department to control such statement, at their discretion, by analyses made confidentially by the Government Chemist."

"That a special Court or Commission be constituted with power to permit or to prohibit in the public interest, or on the ground of non-compliance with the law, the sale and advertisement of any patent, secret or proprietary remedy or appliance, and that the commission appointed for the purpose be a judicial authority such as a Metropolitan Police Magistrate sitting with two assessors, one appointed by the Department, and the other by some such body as the London Chamber of Commerce."

"That a registration number be assigned to every remedy permitted to be sold, and that every bottle or package of it be required to bear the imprint 'R N. . . . . ' (with the number), and that no other words referring to the registration be permitted."

"That in case of a remedy the sale of which is prohibited, the proprietor or manufacturer be entitled to appeal to the High Court against the prohibition."

"That the Department be empowered to require the name and proportion of any poisonous or potent drug forming an ingredient of any remedy to be exhibited upon the label."

"That every medicated wine, and every proprietary remedy containing more alcohol than that required for pharmacological purposes, be required to state upon the label the proportion of alcohol contained in it."

"That the advertisement and sale (except the sale by a doctor's order) of medicines purporting to cure the following diseases be prohibited:

cancer	diabetes	locomotor ataxia
consumption	paralysis	Bright's disease
lupus	fits	rupture (without operation
deafness	epilepsy	or appliance

"That all advertisements of remedies for diseases arising from sexual intercourse or referring to sexual weakness be prohibited."

"That all advertisements likely to suggest that a medicine is an abortifacient be prohibited."

"That it be a breach of the law to change the composition of a remedy without informing the Department of the proposed change."

"That fancy names for recognized drugs be subject to regulation."

"That the period of validity of a name used as a trade-mark for a drug be limited, as in the case of patents and copyrights."

"That it be a breach of the law to give a false trade description of any remedy, and that the following be a definition of a false trade description: 'A statement, design or device regarding any article or preparation, or the drugs or ingredients or substances contained therein, or the curative or therapeutic effect thereof, which is false or misleading in any particular.' And that the onus of proof that he had reasonable ground for belief in the truth of any statement by him regarding a remedy, be placed upon the manufacturer or proprietor of such remedy."

"That it be a breach of the law—

- (a) "To enclose with one remedy printed matter recommending another remedy.
- (b) "To invite sufferers from an ailment to correspond with the vendor of a remedy.
- (c) "To make use of the name of a fictitious person in connection with a remedy. (But it should be within the power of the Department to permit the exemption of an old established remedy from this provision.)
- (d) "To make use of fictitious testimonials.
- (e) "To publish a recommendation of a secret remedy by a medical practitioner unless his or her full name, qualifications and address be given.
- (f) "To promise to return money paid if a cure is not effected."

#### A PROVISIONAL STANDARD FOR PATENT MEDICINES.

In view of the extended work of the A. M. A. Council on Pharmacy and Chemistry upon proprietaries addressed especially to the medical profession, it is not likely that the Commission will greatly concern itself with this particular class of preparations, except perhaps in connection with their purely trade relations.

As regards non-ethical proprietaries, or patent medicines, the Commission has undertaken to formulate a set of tentative declarations setting forth certain requirements as a minimum standard which non-ethical proprietary medicines should meet in order to render them safe in the hands of the general public.

It should be noted that these declarations are put forward as provisional, and that they do not necessarily represent the final opinion of the Commission as to the requirements with which this class of preparations should be expected to comply.

The reasons for the adoption of some of these declarations will probably be sufficiently apparent without explanation. In the case of some others a brief review of the reasons which lead to their adoption may be of value.

*Fraudulent Prescription Nostrums*—Some ten or a dozen years ago, there appeared a class of proprietary articles, now commonly known under the title of "fraudulent prescription nostrums," which because of the cleverness with which they were advertised immediately became very profitable to their exploiters, and as a consequence increased in numbers until they have become a veritable plague to the drug business, both wholesale and retail. While differing in other respects, these nostrums possess the common characteristic of employing fanciful or coined names designed to conceal their proprietary character and to convey the idea that they are simple chemical compounds, or known vegetable drugs commonly found in drug stores and purchasable in small quantities.

One popular form of advertisement for these nostrums is a pretended prescription or formula, the name of the nostrum being cleverly introduced among a list of popularly known drugs, the combination either to be made up by the druggist or by the purchaser himself.

Many of these hypocritical formulas appeal to the feminine desire for personal beauty, and are exploited as the prescriptions of alleged medical specialists or as used by some famous stage beauty.

Chemical analyses of this particular breed of nostrums show that they are frequently composed of the most common and cheap ingredients, as table salt, baking soda, alum, borax, powdered soap, etc., tinted and scented to conceal their simple character, and usually sold at prices enormously in excess of their real value.

Admitting that certain of these combinations may possess some of the cosmetic or medicinal value claimed for them, the Commission is of the opinion that the plain hypocrisy of their exploitation is indefensible upon any ground of fair commercial practice, and has accordingly introduced into the list of requirements for proprietary medicines the following:

*Prescription Takes, Concealment of Proprietary Character*—The preparation must not be named or advertised in such a way as to conceal its proprietary character and lead the purchaser to believe that it is a simple chemical or vegetable drug ordinarily purchasable in small quantities, instead of a proprietary mixture or substance.

*Mail Order Medicines*—Another class of proprietaries deserving of special mention are the products of what may be denominated as the "mail order prac-

tice of medicine." This scheme is usually worked in the name of a physician or company of physicians, operating either on their own account or in the employment of third persons, and consists in the use of newspaper advertisements or of purchased mailing lists to get into communication with prospective customers and then continuing the connection by means of mail correspondence. Pretentious symptom blanks are sent to the patient to be filled out, but no matter what the symptoms are, the case is treated by the sending of one or more stock mixtures which seem to fit every case.

If these ready-made mixtures were found in the stock of a drug store they would undoubtedly be denominated patent medicines, but if they were found in either wholesale or retail drug stocks they would be subject both to federal and to state food and drug laws, and to investigation and analysis by state food and drug departments. Masquerading as they do under the disguise of physicians' prescriptions they escape the wholesome control of these agencies, and as shown by the exposures in *Nostrums and Quackery*, have been the frequent instruments of fraud, and the means of disseminating habit-forming drugs.

Bearing upon this method of marketing, the Commission has adopted the following declaration:

*Methods of Marketing*—The preparation must be one which is regularly offered to the public through the usual trade channels, i. e., through regular wholesale and retail dealers in ready-made medicines, and thus subject to inspection by the authorities charged with the enforcement of state food and drug laws.

*Alcohol Content*—The purposes for which alcohol may be legitimately used in a medicinal preparation are to extract and hold the active constituents of drugs in solution in permanently active condition, or to prevent fermentation, moulding, freezing or other spoilage.

Whether or not an alcoholic medicine can be made to serve as a substitute for a beverage alcoholic liquor depends upon the degree and character of the medication, or upon whether or not the degree of medication is sufficiently great to render it impossible to obtain sufficient alcohol to produce the characteristic stimulation of that compound without taking an overdose of the remaining constituents.

This excess of alcohol in proportion to the degree of medication may be the result of design with the intention of selling an alcoholic stimulant under the disguise of a medicine, or it may be due to the fact that the medicating substance naturally possesses such low activity that it is difficult to include sufficient of it in the solution to prevent the predominance of the alcoholic effect. The latter is the case with numerous undoubtedly legitimate official preparations, such as many of the spirits, elixirs, tinctures, essences, etc., some of which, although the attempt is made to reduce their alcoholic content to the lowest degree consistent with pharmaceutical requirements, yet are capable of serving more or less perfectly as alcoholic substitutes.

In view of the fact that alcohol is a rather expensive ingredient to use in proprietary medicines, it may be assumed that when such remedies are issued in good faith the alcoholic percentage will be as low as the pharmaceutical requirements of the particular combination will permit. Conversely, it seems fair to

assume that when the alcohol percentage of a mixture is far in excess of pharmaceutical requirements, it is for the express purpose of making a preparation that will serve as a substitute for beverage alcoholic liquors.

In considering this question, use was first made of the investigations of the U. S. Commissioner of Internal Revenue in connection with the collection of the tax upon the sale of alcoholic liquors at retail, the results of which are issued from time to time in the form of printed lists of alleged medicinal compounds which are deemed so strongly alcoholic in proportion to the degree of medication as to bring them fairly within the class of alcoholic beverages.

The revenue list examined was dated June 6, 1914, and contained 287 titles of such preparations, with the names and addresses of their manufacturers.

Upon comparing this list with two of the largest wholesale price lists of proprietary medicines, there was found after the elimination of duplicates, a total of 14 preparations named in the price lists which were also included in the revenue list. In other words, 14 preparations recognized as proprietary preparations by the publishers of price lists of such preparations are also recognized as excessively alcoholic by the Commissioner of Internal Revenue.

Examination of several drug stocks failed to show the presence of any of this class of preparations on sale, and inquiries addressed to several wholesale druggists brought the reply that the great majority of the preparations contained in the Revenue Department circular were practically unknown to the wholesale drug trade, and that it was believed that they were mostly sold through the saloon trade, or were preparations of local character devised to evade local prohibitory laws, and ordinances, and not offered for sale outside of the localities in which they originated.

The subject was next approached by the examination of the statements of alcoholic percentage taken from the labels of 1108 proprietary preparations issued by the leading manufacturers of this class of goods within the United States, and believed to fairly represent the average of patent medicines handled by retail druggists. As these statements are required by the Federal Food and Drugs Act, and by similar acts in most of the states, it was believed safe to rely upon their substantial correctness. While it is, of course, possible that some of these statements were not correct, it is not thought likely that there was a sufficient number of misstatements to introduce any material error into the final result.

Of the 1108 preparations considered, three hundred and eight, or 27.79 percent of the total number, were stated to contain alcohol in proportions ranging from 1 percent upward.

A study of the proportion of alcoholic to non-alcoholic preparations recognized by the United States Pharmacopœia and National Formulary, yields the following:

Total number of U. S. P. preparations, liquid and solid, of galenical character .....	427
Number of U. S. P. galenicals containing more than one percent of alcohol .....	206
Percent of U. S. P. galenicals containing alcohol .....	48.24

A similar study of the titles of the National Formulary (third edition), most of which are for preparations which can be denominated pharmaceuticals, presents the following:

Total number of N. F. preparations of galenical character	575
Total number of N. F. preparations containing alcohol . . . .	274
Percent of N. F. preparations containing alcohol . . . . .	47.65

In enumerating the U. S. P. and N. F. galenicals, definite chemical compounds, vegetable drugs, the several forms of unmedicated alcohol, unmedicated spirits, and unmedicated wines were omitted as not properly coming within the term pharmaceutical preparations, and therefore not properly comparable with proprietary medicines. Certain other U. S. P. and N. F. preparations which contain only trifling quantities of alcohol, such as syrup of tolu, etc., were also omitted.

No preparations were considered as alcoholic if the alcohol is removed in the process of manufacture.

While the study of the general subject of alcohol in proprietary medicines has not proceeded sufficiently to warrant any extensive generalizations, and is therefore reserved for further study, the Commission at this time offers the following declaration:

*Alcohol Content of Proprietary Medicines*—If the preparation contains alcohol, it must be sufficiently medicated to prevent its use as an intoxicating beverage, and in addition to this requirement the proportion of alcohol present must not be greater than is properly necessary to hold in solution in permanently active condition the essential constituents of the preparation, and to protect the preparation against freezing, fermentation, or other deleterious change.

*Content of Habit-Forming Narcotic Drugs*—Using the same 1108 preparations studied for alcoholic content, a similar study was made of their content of narcotic, habit-forming drugs, the data being taken from the statements on the labels made in accordance with the requirements of federal and state laws.

One fact developed was that not one of the labels mentioned the presence of cocaine in any quantity, a condition rather unexpected in view of the frequently published statement that this alkaloid is a frequent constituent of patent medicines. While undoubtedly there were formerly proprietary remedies containing cocaine, and that there still may be some that have not come to the attention of the Commission, it is not probable that a sufficient number of such preparations exist to constitute a serious menace.

Extract of Cannabis Indica was mentioned in three of the 1108 preparations, two of the three being corn remedies which could not be used internally, and the third a cough remedy in which the accompanying medication is probably sufficient to render it unlikely that the preparation could be successfully used to produce the narcotic effects of the Cannabis without taking an overdose of the other ingredients.

No one of the 1108 preparations was stated to contain chloral in any proportion, though it is possible that further search may develop the existence of chloral-containing medicines which are advertised to the general public.

The preparations, presumably not intended for internal use, stated to contain opium or one of its alkaloids in some proportion were as follows:

Injectons for Gonorrhea .....	2
Tooth-Ache Remedies .....	2
Liniments and Embrocations .....	5
Pile Remedies .....	8
Antiseptic Salve .....	1
Eye Salves and Eye Waters .....	10
Total .....	<hr/> 28

In the above preparations the narcotic content was in excess of two grains of opium, or of one-fourth grain of morphine to the ounce in twenty instances, and not in excess of these proportions in five instances.

Whether any of the above 28 preparations would be capable of use internally so as to produce the narcotic effect of opium without an overdose of the other constituents has not yet been given consideration by the Commission.

The preparations admittedly intended for internal use, containing opium or a derivative were as follows:

Asthma and Bronchitis Remedies .....	2
Soothing Powders and Teething Syrups .....	4
Diarrhœa Cordials and Cholera Morbus Remedies.	12
Cough and Cold Cures .....	21
Tablet forms, mostly for cough .....	3
Total .....	<hr/> 44

Besides the above there were 15 preparations of miscellaneous character not easily classified with any of the preceding, which contained opium or one of its alkaloids.

Of the preparations plainly intended for internal use, seven contained opium in excess of two grains to the ounce, six of these being diarrhœa cordials, or cholera morbus remedies, in which the proportions ranged from 3 to 8 grains to the ounce, or materially less than the average opium content of the five diarrhœa mixtures of the National Formulary. The last one of these seven preparations was an asthma remedy, which was stated to contain  $23\frac{1}{3}$  grains of opium to the ounce.

The largest proportion of morphine or its sulphate in any preparation for internal use was 1 grain to the ounce. In one preparation the alkaloid present was codeine, in the proportion of  $11\frac{3}{4}$  grain to the ounce of tablets.

Heroin was reported in one cough syrup in the proportion of  $1\frac{1}{19}$  grain to the ounce.

In the majority of cases the proportions stated to be present did not exceed the quantities permitted by the Harrison Law, namely, 2 grains of opium,  $\frac{1}{4}$  grain of morphine, 1 grain of codeine, or  $\frac{1}{8}$  grain of heroin to the ounce, and in many cases the proportions are considerably lower.

Of the four preparations for children's use which contained opiates, two contained 2 grains of opium, one contained  $9/20$  grain of opium, and one  $1/4$  grain of morphine to the ounce.

It is perhaps only fair to state that the statements of narcotic content were compiled before the enactment of the Harrison Law, and it is probable that if the packages now being issued were to be examined it would be found that those intended for interstate commerce would comply with that act.

Whether or not opium or its alkaloids, or the narcotic derivatives of the latter can be dispensed in combination with other active non-narcotic drugs in such a way as to prevent the use of the combination from leading to a drug habit is a question which the Commission expressly reserves for further study.

As a provisional measure the Commission has adopted the following declarations:

*Content of Habit-Forming Drug*—If the preparation is one which is capable of being used internally, whether recommended for internal use or not, it must not contain cocaine, nor shall it contain opium or any of its alkaloids or their derivatives in greater proportions than those specified in Section Six of the Federal Law commonly known as the Harrison Act, and it shall also contain other active drugs in such proportion that the use of the preparation will not be likely to create a drug habit, nor satisfy such a habit when previously existing.

*Remedies for Children's Use*—If intended for administration to infants or children, the preparation must not contain cocaine, or opium or its alkaloids, or their derivatives, in any proportion whatever.

Of the remaining declarations, namely, those relating to the Activity of Proprietary Preparations, Immoral or Illegal Purposes, Incurable and Contagious Diseases, Conformity in Labeling to the Federal Food and Drugs Act, and to Advertising, the Commission deems them of such evident propriety that no comment is needed, and therefore offers none.

The ten declarations provisionally adopted are as follows:

MINIMUM REQUIREMENTS WITH WHICH PROPRIETARY REMEDIES SHOULD COMPLY  
IN ORDER TO RENDER THEM SAFE FOR DIRECT SALE TO THE GENERAL PUBLIC.\*

The following declarations are provisional, and subject to repeal, modification or expansion as the Commission may later decide.
